FEDERAL REGISTER Published daily, Monday through Friday, (not published on Saturdays, Sundays, or on official holidays), by the Office of the Federal Register, National Archives and Records Administration, Washington, DC 20408, under the Federal Register Act (49 Stat. 500, as amended; 44 U.S.C. Ch. 15) and the regulations of the Administrative Committee of the Federal Register (1 CFR Ch. I). Distribution is made only by the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402.

The **Federal Register** provides a uniform system for making available to the public regulations and legal notices issued by Federal agencies. These include Presidential proclamations and Executive Orders and Federal agency documents having general applicability and legal effect, documents required to be published by act of Congress and other Federal agency documents of public interest. Documents are on file for public inspection in the Office of the Federal Register the day before they are published, unless earlier filing is requested by the issuing agency.

The seal of the National Archives and Records Administration authenticates this issue of the **Federal Register** as the official serial publication established under the Federal Register Act. 44 U.S.C. 1507 provides that the contents of the **Federal Register** shall be judicially noticed.

The **Federal Register** is published in paper, 24x microfiche format and magnetic tape. The annual subscription price for the **Federal Register** paper edition is $375, or $415 for a combined **Federal Register**, Federal Register Index and List of CFR Sections Affected (LSA) subscription; the microfiche edition of the **Federal Register** including the Federal Register Index and LSA is $353; and magnetic tape is $37,500. Six month subscriptions are available for one-half the annual rate. The charge for individual copies in paper form is $4.50 for each issue, or $4.50 for each group of pages as actually bound; or $1.50 for each issue in microfiche form; or $175.00 per magnetic tape. All prices include regular domestic postage and handling. International customers please add 25% for foreign handling. Remit check or money order, made payable to the Superintendent of Documents, or charge to your GPO Deposit Account, VISA or MasterCard. Mail to: New Orders, Superintendent of Documents, P.O. Box 371954, Pittsburgh, PA 15250–7954.

How To Cite This Publication: Use the volume number and the page number. Example: 57 FR 12345.

Title 3—

The President

Proclamation 6520 of December 23, 1992

National Good Teen Day, 1993

By the President of the United States of America

A Proclamation

The passage between childhood and adulthood constitutes one of the most eventful stages of our life's journey. The teen years are as challenging as they are exciting, and at a time when young Americans are facing more serious pressures than ever before—from substance abuse and violence to sexual promiscuity and dropping out of school—it is fitting that we set aside this day to reaffirm the unique, God-given potential of every teenager.

Today millions of American teenagers are setting examples for others by demonstrating love and respect for their parents, by meeting their responsibilities at home and in school, by participating in their places of worship, and by showing consideration and concern for their classmates and neighbors. They are also enjoying the rewards of voluntary service to others, thereby contributing to our communities and Nation as Points of Light. These teens are making the most of their talents and opportunities and, through their determination and hard work, are building the foundation for a bright future.

It is vital that we recognize and reinforce good behavior among teens and instill in every child a positive sense of responsibility, self-control, and self-worth. The pursuit of freedom and independence is characteristic of adolescence. Yet, while most adolescents demand increasing autonomy, they also continue to need and seek their parents' reassurance, guidance, and support. For teenagers who are struggling to cope with the many physical and emotional changes of adolescence, as well as the external pressures that weigh so heavily on young people today, such encouragement and guidance are essential. We must provide our teens with opportunity and hope, with firm yet loving moral guidance and discipline, and—most important—with clear, consistent examples of personal responsibility and virtue.

No child is destined to become a "bad teen." Through loving, responsible parenting and through the support of schools, churches, and communities that set high standards of character and conduct for people of all ages, we can help every young American to recognize and attain his or her fullest potential. On this occasion, let us resolve to do exactly that.

The Congress, by House Joint Resolution 409, has designated January 16, 1993, as "National Good Teen Day" and has authorized and requested the President to issue a proclamation in observance of this day.

NOW, THEREFORE, I, GEORGE BUSH, President of the United States of America, do hereby proclaim January 16, 1993, as National Good Teen Day. I invite all Americans to observe this day with appropriate programs and activities in honor of America's teenaged citizens.

IN WITNESS WHEREOF, I have hereunto set my hand this twenty-third day of December, in the year of our Lord nineteen hundred and ninety-two, and of the Independence of the United States of America the two hundred and seventeenth.

Presidential Documents

Proclamation 6521 of January 4, 1993

National Sanctity of Human Life Day, 1993

By the President of the United States of America

A Proclamation

Americans have demonstrated their commitment to the belief "that all men are created equal, that they are endowed by their Creator with certain unalienable Rights, that among these are Life, Liberty and the pursuit of Happiness." This tradition of generosity and reverence for human life stands in marked contrast with the prevalence of abortion in America today—some 1.5 million children lost each year; more than 4,000 each day. This is shocking evidence of just how far we have strayed from our Nation's most cherished values and beliefs. Thus we pause on this National Sanctity of Human Life Day to call attention to the tragedy of abortion and to recognize the many individuals who are working to restore respect for human life in our Nation.

Advances in science and technology have offered us tremendous new insight on life in the womb: parents can now hear their unborn child's heartbeat as early as 8 weeks of age; physicians can monitor the baby's development using high-resolution sonography; and they may even diagnose and treat abnormalities before birth. How terribly ironic it is that, at one hospital or clinic, an unborn child may be carefully treated as a patient, while at another facility—perhaps just a few blocks away—another innocent child may become a victim of abortion.

Recognizing the tragedy of abortion and the feelings of desperation that lead some women to make such a painful, devastating choice, concerned individuals throughout the United States are working to help women choose life for their unborn children. On this occasion we recognize the many generous Americans who—with nothing to gain for themselves—reach out to women in need through crisis pregnancy centers, residential facilities, mentoring programs, and a host of other support services. We also recognize the many social services professionals, attorneys, and counselors who assist in promoting the adoption option, and we salute each of the courageous women who make this unselfish choice for their children. Such works of generosity and compassion are saving lives and, yes, slowly but surely turning hearts—one woman, one couple, one community at a time.

The struggle to overcome abortion in the United States—to educate individuals about life in the womb, to restore reverence for the miracle of creation, and to expand alternatives for women in need—is far from ended. While the struggle may be a long and difficult one, many Americans know that it is a cause from which we cannot retreat. And because it is a cause that appeals directly to the conscience of the Nation—a Nation that has, time and again, demonstrated its capacity to rediscover its highest ideals, ideals rooted in our belief in the God-given rights and dignity of every human being—it is a cause that cannot fail.

NOW, THEREFORE, I, GEORGE BUSH, President of the United States of America, by virtue of the authority vested in me by the Constitution and laws of the United States, do hereby proclaim Sunday, January 17, 1993, as National Sanctity of Human Life Day. I call on all Americans to reflect on the sanctity of human life in all its stages and to gather in homes and places of worship to give thanks for the gift of life and to reaffirm our commitment to respect the life and dignity of every human being.

IN WITNESS WHEREOF, I have hereunto set my hand this fourth day of January, in the year of our Lord nineteen hundred and ninety-three, and of the Independence of the United States of America the two hundred and seventeenth.

DEPARTMENT OF JUSTICE

Immigration and Naturalization Service

8 CFR Part 100

[INS No. 1511–92]

RIN 1115–AC95

Statement of Organization; Name Change for Border Patrol Stations in Sector Number 2

AGENCY: Immigration and Naturalization Service, Justice.

ACTION: Final rule.

SUMMARY: This final rule amends 8 CFR 100.4 by revising the names of stations located in Border Patrol sector headquarter's number 2 from "Malone, New York" to "Burke, New York", from "Rouses Point, New York" to "Champlain, New York", and from "Derby Line, Vermont" to "Newport, Vermont". These changes are necessary to show the actual city in which these Border Patrol stations are physically located.

EFFECTIVE DATE: January 6, 1993.

FOR FURTHER INFORMATION CONTACT: Marion E. Moody, Assistant Chief Patrol Agent, Border Patrol, Immigration and Naturalization Service, 425 I Street, NW., room 7227, Washington, DC 20536, telephone (202) 514–1109.

SUPPLEMENTARY INFORMATION: 8 CFR 100.4 is being amended to change the names of three Border Patrol stations located in sector headquarters number 2 from "Malone, New York" to "Burke, New York", from "Rouses Point, New York" to "Champlain, New York", and from "Derby Line, Vermont" to "Newport, Vermont", to show the actual city in which these Border Patrol stations are located.

The Service's implementation of this rule as a final rule is based upon 5 U.S.C. 553 (b)(A) as it is a rule of agency organization. The immediate implementation of this final rule is based upon the "good cause" exception found at 5 U.S.C. 553 (d) in that the usual notice provisions are unnecessary because the rule will benefit the public by showing the actual city in which these Border Patrol stations are physically located.

In accordance with 5 U.S.C. 605(b), the Commissioner of the Immigration and Naturalization Service certifies that this rule does not have a significant adverse economic impact on a substantial number of small entities. This rule is not considered to be a major rule within the meaning of section 1(b) of E.O. 12291, nor does this rule have Federalism implications warranting the preparation of a Federalism Assessment in accordance with E.O. 12612.

List of Subjects in 8 CFR Part 100

Authority delegation (Government agencies), Organization and functions (Government agencies).

Accordingly, part 100 of chapter I of title 8 of the Code of Federal Regulations is amended as follows:

PART 100—STATEMENT OF ORGANIZATION

1. The authority citation for part 100 continues to read as follows:

Authority: 8 U.S.C. 1103; 8 CFR part 2.

§ 100.4 [Amended]

2. In § 100.4, paragraph (d) is amended by revising the border patrol station names in Sector No. 2:

a. From "Derby Line, VT" to read: "Newport, VT";

b. From "Malone, NY" to read: "Burke, NY"; and

c. From "Rouses Point, NY" to read: "Champlain, NY".

Dated: December 21, 1992.

Gene McNary,

Commissioner, Immigration and Naturalization Service.

BILLING CODE 4410–10–M

FEDERAL RESERVE SYSTEM

12 CFR Part 225

[Regulation Y; Docket No. R–0755]

Review Criteria for Bank Holding Company Applications

AGENCY: Board of Governors of the Federal Reserve System.

ACTION: Final rule.

SUMMARY: The Board is amending its Regulation Y to implement certain regulatory improvements contained in sections 202(d) and 210 of the Federal Deposit Insurance Corporation Improvement Act of 1991 (FDICIA). The final rule specifies additional factors that the Federal Reserve System must consider in acting on applications by bank holding companies to acquire banks under section 3 of the Bank Holding Company Act. The intended effect of the amendment is to conform the Board's regulations to the statutory changes.

EFFECTIVE DATE: February 4, 1993.

FOR FURTHER INFORMATION CONTACT: Scott G. Alvarez, Associate General Counsel (202–452–3583), or Brian E.J. Lam, Attorney (202–452–2067), Legal Division; or Sidney M. Sussan, Assistant Director (202–452–2638), Division of Banking Supervision and Regulation, Board of Governors of the Federal Reserve System. For the hearing impaired only, Telecommunications Device for the Deaf (TDD), Dorothea Thompson (202–452–3544), Board of Governors of the Federal Reserve System, 20th and C Street, NW., Washington, DC 20551.

SUPPLEMENTARY INFORMATION: The Board is adopting a final rule that revises its Regulation Y to include new supervisory factors that FDICIA requires the Board to consider in reviewing and acting on applications by bank holding companies to acquire banks under section 3 of the Bank Holding Company Act (BHC Act). These changes are required by sections 202(d) and 210 of FDICIA, Public Law 102–242, 105 Stat. 2237, 2290, 2298. On April 15, 1992, the Board adopted an interim rule that implemented sections 202(d) and 210 of FDICIA, and requested public comment on the revision to Regulation Y. 57 FR 13002, April 15, 1992. The public comment period expired on June 15, 1992.

Section 202(d) of FDICIA provides that the Board must disapprove an application under section 3 of the BHC Act if;

(1) The bank holding company fails to provide the Board with adequate assurances that it will make available to the Board such information on its operations or activities, and the operations or activities of any affiliates, as the Board deems appropriate to determine and enforce compliance with BHC Act; or

(2) In the case of an application involving a foreign bank, the foreign bank is not subject to comprehensive supervision or regulation on a consolidated basis by the appropriate authorities in the bank's home country. Public Law 102–242, 105 Stat. 2237, 2290. Section 210 of FDICIA also provides that the Board's consideration of the managerial resources of a bank holding company or bank shall include consideration of the competence, experience and integrity of the officers, directors and principal shareholders of the bank holding company or bank. Public Law 102–242, 105 Stat. 2237, 2298.

The Board is adopting a final rule substantially as proposed. The final rule adopts the statutory language contained in sections 202(d) and 210 of FDICIA, specifying that, in deciding applications under section 3 of the BHC Act, the Board will consider the competence, experience, and integrity of the officers, directors, and principal shareholders of the applicant, and of the banks and bank holding companies concerned, their record of compliance with applicable laws and regulations, and the record of the applicant and its affiliates of fulfilling any commitments to, and any conditions imposed by, the Board in connection with prior applications.[1] In addition, the final rule adopts a definition of "principal shareholder."[2]

The Board will also consider whether the applicant has provided the Board with adequate assurances that it will make available such information on its operations or activities, and the operations or activities of any affiliate of the applicant, that the Board deems appropriate to determine and enforce compliance with the BHC Act and other applicable federal banking statutes, and any regulations thereunder. Moreover, in the case of an application involving a foreign banking organization, the Board will consider whether the organization is subject to comprehensive supervision or regulation on a consolidated basis by the appropriate authorities in the organization's home country.

The final rule is being adopted in conjunction with the Board's implementation of the Foreign Bank Supervision Enhancement Act of 1991 (FBSEA), subtitle A of title II of FDICIA, which changed the authority of the Board under the International Banking Act of 1978. FBSEA provided the Board with new authority to approve the establishment of U.S. offices by a foreign bank, and to regulate and supervise the operations of a foreign bank with U.S. offices.

The Board anticipates that the final rule will not impose any significant additional burdens on domestic banking organizations or financial institutions because the Board currently seeks, and has generally been able to obtain, from domestic applicants all of the information needed to consider section 3 applications. The Board is not proposing to seek any additional types or quantities of information from domestic applicants by virtue of the final rule. The final rule ensures that the Board is able to obtain from all applicants, especially foreign applicants operating in jurisdictions that limit or prohibit the disclosure of financial information outside of the jurisdiction, the same type of information that the Board now seeks and typically obtains from domestic applicants.

Comments

In response to its request, the Board received four comments. Two commenters, a Federal Reserve Bank and a banking organization, favor the adoption of the interim rule as a final rule. Another commenter, a foreign bank, supports the goal of strengthening the applications process under the BHC Act, and agrees that the competence, experience and integrity of the officers and directors of banks and bank holding companies should be considered, as required by section 210 of FDICIA. This commenter, however, suggests that the Board should not consider the competence and experience of shareholders where such shareholders are passive investors that do not anticipate any significant involvement in the management of the bank or the bank holding company.

Section 210 expressly provides that the Board's consideration of the managerial resources of a bank or bank holding company include consideration of the competence, experience, and integrity of the officers, directors, and principal shareholders of the company or bank. Thus, the text of section 210 directs the Board to consider all three managerial factors with respect to all three groups of individuals.

However, the Board believes that the statutory language does not prevent the Board from considering the extent of the role a principal shareholder may play in the management of a bank or a bank holding company when evaluating the competence or experience of the shareholder. An underlying purpose of section 210 is to permit the Board to consider the abilities of the principal shareholders of banks and bank holding companies in appropriate situations, including situations where a principal shareholder has or could have a significant effect on the financial and managerial resources, future prospects, or safety and soundness of a bank or bank holding company. Thus, the Board could consider whether a shareholder proposes to be a passive investor in weighing the shareholder's banking experience and competence.

The final commenter, a banking association, suggests that, in reviewing applications submitted by domestic bank holding companies, the Board not

[1] The Board's regulations currently provide that, in considering applications under section 3 of the BHC Act, the Board will consider the records of the applicant, its subsidiaries, any banks related to the applicant through common ownership or management, and the bank or banks to be acquired, of complying with applicable laws and regulations, and their record of fulfilling any commitments to, and any conditions imposed by, the Board in connection with prior applications. See 12 CFR 225.13(b)(2). These provisions will remain unchanged in the final rule.

[2] Regulation Y currently includes a definition of "principal shareholder" that is used in determining the Board's presumption of control of a financial institution or banking organization, and in the Board's Capital Adequacy Guidelines. In order to avoid confusion and to maintain consistency between the statutory language of FDICIA and the implementing provisions of Regulation Y, the Board has redesignated the current term "principal shareholder" as "controlling shareholder", and has added a new definition of the term "principal shareholder" that applies strictly to the standards the Board must review under the FDICIA amendments to the BHC Act. Thus, in the final rule, the term "controlling shareholder" means any person that owns or controls, directly or indirectly, 25 percent or more of any class of voting securities of a bank or other company. Corresponding changes have been made in the Board's regulations regarding presumptions of control, and in the Board's Capital Adequacy Guidelines. The term "principal shareholder" has been redefined for purposes of implementing the FDICIA provisions to mean any person that owns or controls, directly or indirectly, 10 percent or more of any class of voting securities of a bank or other company, or any person that the Board determines has the power to exercise, directly or indirectly, a controlling influence over the management or policies of a bank or other company. The Board believes that the managerial qualities of all major shareholders (*i.e.*, shareholders controlling 10 percent or more of any class of voting securities) should be considered in appropriate situations. This is the level of ownership at which shareholder review is conducted under the Change in Bank Control Act, 12 U.S.C. 1817(j). As discussed in the preamble, the Board will consider the actual or anticipated role of a principal shareholder in the management of a bank in evaluating the competence, experience and integrity of that individual.

require domestic applicants to provide information on their respective operations and activities, and the operations and activities of their affiliates. This commenter asserts that the text and placement of section 202(d) of FDICIA, its legislative history, and other legal and practical considerations all support exempting domestic banks and bank holding companies from this requirement.

The Board has considered these comments and concluded that domestic bank holding companies should not be exempted from the requirement that, when submitting section 3 applications, they provide the Board with adequate assurances that they will make available appropriate information to the Board. By its express terms, section 202(d) requires the Board to disapprove *any* application by *any* bank holding company under section 3 of the BHC Act if the company fails to provide adequate assurances that the company will make available to the Board such information on the operations or activities of the company or any affiliate of the company. In drafting section 202(d), Congress expressly limited the application of certain other provisions of that section to foreign banks, without imposing a similar limitation on the "availability of information" provision. Moreover, the legislative history of section 202(d) expressly indicates that this requirement is applicable to domestic bank holding companies.[3] Thus, in light of the statutory language and the legislative history of section 202(d), the Board has concluded that the availability of information provision should apply to domestic bank holding companies.

[S]ection 202(d) amends the BHC Act to permit the Board to disapprove *any application* to acquire a U.S. bank unless the Board is given adequate assurances that it will have access to information on the operations or activities of a company or companies, or any affiliates, making application to acquire a U.S. bank that the Board deems necessary to fulfill the requirements of the [International Banking Act], the BHC Act, or the [Financial Institutions Supervisory Act of 1966]. *This requirement applies to applications by both foreign banking organizations and domestic bank holding companies.*

H.R. Rep. No. 157, 102nd Cong., 1st Sess. 159 (1991) (emphasis added); *see also* Section-By-Section Analysis Of S. 543 As Reported By The Senate Banking Committee, *reprinted in* 138 Cong. Rec. 2059, 2094 (February 21, 1992) (noting that the availability of information provision "applies to applications by both foreign banking organizations and domestic bank holding companies").

The Board does not believe, however, that the final rule will impose a significant additional burden on domestic applicants because the Board currently seeks and typically is able to obtain from such applicants all of the information needed to consider section 3 applications. The Board does not expect or propose, following adoption of this final rule, to seek additional types or quantities of information from domestic applicants than the Board currently seeks from these applicants.

The commenter also suggests that the Board should require domestic banks and bank holding companies to provide information on an affiliate only if the affiliate either transacts business with the bank that goes beyond ordinary deposit or loan services, or exposes the bank to substantial risk. Based on the express language and legislative history of section 202(d), which both refer to "any affiliates" of the applicant, the Board also has concluded that applicants should provide the necessary assurances with regard to all affiliates, not just affiliates that transact business with a bank that goes beyond ordinary deposit or loan services or that exposes a bank to substantial risk.

However, under section 202(d) and the final rule, the Board retains discretion to determine on a case-by-case basis the extent that assurances are needed for affiliates under common control of individuals. The Board does not believe that, in light of the language and purpose of section 202(d) of FDICIA, it is appropriate to provide a general regulatory exemption for all or most companies affiliated through individual owners.

Finally, the commenter urges the Board not to require banks, bank holding companies and their affiliates to provide information that is deemed to be privileged or confidential under applicable federal or state laws. No such exception appears to have been contemplated by section 202(d). The Board believes that, in certain circumstances, it may be appropriate for the Board to request, and for applicants to provide, information which may be deemed privileged or confidential. The Board can and will, however, afford this information confidential treatment as provided in the Freedom of Information Act. Accordingly, the Board believes that it is not appropriate to adopt a regulatory provision limiting the Board's ability to request or obtain relevant confidential or privileged information.

For all of the foregoing reasons, the Board has concluded that the availability of information provision of the interim rule should remain unchanged in the final rule.

Regulatory Flexibility Act

Pursuant to section 605(b) of the Regulatory Flexibility Act, the Board hereby certifies that the final rule will not have a significant impact on a substantial number of small entities.

The final rule imposes the minimum burdens necessary to implement the provisions of sections 202(d) and 210 of FDICIA for all banks and bank holding companies subject to the regulation, regardless of size. The regulation specifies additional factors which the Board must consider in acting on applications by bank holding companies to acquire banks under section 3 of the BHC Act. The final rule does not impose any additional regular recordkeeping, reporting or other similar requirements on banks.

List of Subjects in 12 CFR Part 225

Administrative practice and procedure, Banks, Banking, Federal Reserve System, Holding companies, Reporting and recordkeeping requirements, Securities.

For the reasons set forth in the preamble, and pursuant to the Board's authority under section 5(b) of the Bank Holding Company Act of 1956, 12 U.S.C. 1844(b), the Board amends part 225 of Chapter II of Title 12 of the Code of Federal Regulations as follows:

PART 225—BANK HOLDING COMPANIES AND CHANGE IN BANK CONTROL

1. Section 225.2 is amended by revising the text of paragraph (k) as follows:

§ 225.2 Definitions.

* * * * *

(k)(1) *Controlling shareholder* means a person that owns or controls, directly or indirectly, 25 percent or more of any class of voting securities of a bank or other company.

(2) *Principal shareholder* means a person that owns or controls, directly or indirectly, 10 percent or more of any class of voting securities of a bank or other company, or any person that the Board determines has the power, directly or indirectly, to exercise a controlling influence over the management or policies of a bank or other company.

* * * * *

[3] For example, the Report of the House Committee on Banking, Finance and Urban Affairs states:

2. Section 225.13 is amended by revising paragraphs (a) and (b)(2) to read as follows:

§ 225.13 Factors considered in acting on bank applications.

(a) *Prohibited anticompetitive transactions.* As specified in section 3(c) of the BHC Act, the Board may not approve any application under this subpart if:

(1) The transaction would result in a monopoly or would further any combination or conspiracy to monopolize, or to attempt to monopolize, the business of banking in any part of the United States;

(2) The effect of the transaction may be substantially to lessen competition in any section of the country, tend to create a monopoly, or in any other manner be in restraint of trade, unless the Board finds that the transaction's anticompetitive effects are clearly outweighed by its probable effect in meeting the convenience and needs of the community;

(3) The applicant has failed to provide the Board with adequate assurances that it will make available such information on its operations or activities, and the operations or activities of any affiliate of the applicant, that the Board deems appropriate to determine and enforce compliance with the BHC Act and other applicable federal banking statutes, and any regulations thereunder; or

(4) In the case of an application involving a foreign bank, the foreign bank is not subject to comprehensive supervision or regulation on a consolidated basis by the appropriate authorities in its home country, as provided in § 211.24(c)(1)(ii) of the Board's Regulation K (12 CFR 211.24(c)(1)(ii)).

(b) * * *

(2) *Managerial Resources.* The competence, experience, and integrity of the officers, directors, and principal shareholders of the applicant, its subsidiaries, and the banks and bank holding companies concerned; their record of compliance with laws and regulations; and the record of the applicant and its affiliates of fulfilling any commitments to, and any conditions imposed by, the Board in connection with prior applications.

* * * * *

3. Section 225.31 is amended by revising paragraph (d)(2)(ii) to read as follows:

§ 225.31 Control proceedings.

(d) * * *

(2) * * *

(ii) *Shares controlled by company and associated individuals.* A company that, together with its management officials or controlling shareholders (including members of the immediate families of either as defined in 12 CFR 206.2(k)), owns, controls, or holds with power to vote 25 percent or more of the outstanding shares of any class of voting securities of a bank or other company controls the bank or other company, if the first company owns, controls, or holds with power to vote more than 5 percent of the outstanding shares of any class of voting securities of the bank or other company.

* * * * *

4. Appendix B is amended by revising footnote 1 to read as follows:

Appendix B to Part 225—Capital Adequacy Guidelines for Bank Holding Companies and State Member Banks: Leverage Measure

* * * * *

[1] The guidelines will apply to bank holding companies with less than $150 million in consolidated assets on a bank-only basis unless:

(1) The holding company or any nonbank subsidiary is engaged directly or indirectly in any nonbank activity involving significant leverage or

(2) The holding company or any nonbank subsidiary has outstanding significant debt held by the general public. Debt held by the general public is defined to mean debt held by parties other than financial institutions, officers, directors, and controlling shareholders of the banking organization or their related interests.

* * * * *

By order of the Board of Governors of the Federal Reserve System, December 29, 1992.

William W. Wiles,

Secretary of the Board.

DEPARTMENT OF THE TREASURY

Office of Thrift Supervision

12 CFR Part 567

[No. 92–539]

RIN 1550–AA50

Valuation and Regulatory Capital Treatment of Foreclosed Assets

AGENCY: Office of Thrift Supervision, Treasury.

ACTION: Final rule.

SUMMARY: The Office of Thrift Supervision (OTS) is revising its policy guidance to require savings associations to use fair value rather than net realizable value (NRV) for valuing foreclosed assets subsequent to acquisition. The OTS is also amending its capital regulation to place all assets previously assigned to the 200 percent risk-weight category, including foreclosed assets, into the 100 percent risk-weight category. The accounting change will make the accounting treatment of foreclosed assets consistent with generally accepted accounting principles as applied by the other Federal banking agencies. The capital rule change will make the capital treatment of certain items, including foreclosed assets, consistent with the new accounting treatment and with the treatment accorded these assets by the other Federal banking agencies.

EFFECTIVE DATE: December 31, 1992.

FOR FURTHER INFORMATION CONTACT: Robert J. Fishman, Program Manager, (202) 906–5672, Deidre G. Kvartunas, Program Analyst, (202) 906–7933, Timothy J. Stier, Deputy Chief Accountant (202) 906–5699, Policy; Catherine A. Shepard, Senior Attorney, Regulations and Legislation Division, Office of Chief Counsel (202) 906–7275; Office of Thrift Supervision, 1700 G Street, NW., Washington, DC 20552.

SUPPLEMENTARY INFORMATION:

I. Background and Summary of Proposal

On October 7, 1992, the OTS published a proposal to modify its classification, valuation, and regulatory capital treatment of troubled, collateral-dependent loans and foreclosed assets.[1] The OTS proposed three new policies:

(a) The use of fair value instead of net realizable value for the valuation of troubled, collateral-dependent loans and foreclosed assets;

(b) A requirement to use charge-offs instead of specific valuation allowances (SVAs) for amounts classified "loss"; and

(c) The removal of the 200 percent risk-weight category, and the reassignment of items formerly in that category to the 100 percent risk-weight category for capital purposes.[2]

The purposes of the proposal were to conform OTS's accounting treatment for troubled, collateral-dependent loans and foreclosed assets with that of the other Federal banking agencies and to amend its capital regulations to be consistent with the change in valuation

[1] 57 FR 46,098 (Oct. 7, 1992).

[2] Three types of assets are currently placed in the 200 percent risk-weight category under the OTS's risk-based capital rule: (1) Repossessed (or foreclosed) assets; (2) assets that are more than 90 days past due (except 1–4 family residential real estate that is more than 90 days past due, which is placed in the 100 percent risk-weight category); and (3) equity investments that OTS determines to have the same risk characteristics as real estate owned. 12 CFR 567.6(a)(1)(v).

methodology. The OTS intended that the proposed changes in valuation methodology would be reflected in agency guidance such as a Thrift Bulletin or instructions to the Thrift Financial Report. The requirement that charge-offs be used instead of SVAs and the removal of the 200 percent risk-weight category were to be accomplished through amendment of the agency's regulations.

II. Summary of Comments

The OTS received thirty-one comment letters on its proposal. Commenters included twenty-three savings associations, five financial institution trade associations, a bank holding company with a savings bank subsidiary, an accounting trade association, and an individual. As discussed in Section III below, today's final action addresses only the accounting treatment for foreclosed assets and the accompanying amendment to the capital rule. Comments addressing the use of fair value for troubled, collateral-dependent loans will be summarized and discussed when the agency issues its final guidance on that issue. Similarly, comments addressing the use of charge-offs instead of SVAs will be summarized and discussed in any final regulation on that issue.

Only ten commenters addressed whether the OTS should revise its guidance on foreclosed assets to require savings associations to value such assets at their fair value. All ten commenters supported the proposed change. Twenty of the commenters discussed the OTS's proposal to amend the risk-based capital rules by eliminating the 200 percent risk-weight category and placing foreclosed assets in the 100 percent risk-weight category. In light of the proposed changes in valuation for these assets, all twenty commenters supported this portion of the proposal without modification.

III. Description of Final Guidance and Regulation

The OTS has decided to finalize only part of its October proposal. First, the OTS is requiring that, as of December 31, 1992, savings associations use fair value for the valuation of all foreclosed assets. Second, today's final rule removes the 200 percent risk-weight category and reassigns all assets in that category to the 100 percent risk-weight category. The OTS is postponing to a later date final action on the application of fair value to troubled collateral-dependent loans and on revising its regulations on the use of charge-offs instead of SVAs. Final guidance will address both troubled collateral-dependent loans and foreclosed assets.[3]

A. Foreclosed Assets

The OTS is revising its policy on foreclosed assets, including repossessed real estate. Under the new policy, after foreclosure, foreclosed assets must be carried at the lower of cost or fair value,[4] based on the presumption that such assets are held for sale. The cost of such assets at the time of foreclosure is the fair value of the assets foreclosed. This policy also applies to in-substance foreclosures.

This policy accords with the Statement of Position (SOP) 92–3, "Accounting for Foreclosed Assets," issued by the American Institute of Certified Public Accountants. Under the SOP, there is a rebuttable presumption that foreclosed assets are held for sale. The SOP recommends that foreclosed assets held for sale be carried at the lower of: (a) Fair value minus estimated costs to sell, or (b) cost. While the SOP mandates the use of fair value for foreclosed assets in annual financial statements for periods ending on or after December 15, 1992, all savings associations, regardless of when their fiscal years end, must use the fair value method in all regulatory reports prepared for periods ending on or after December 31, 1992.

B. Removal of 200 Percent Risk-Weight Category

The OTS is also amending its risk-based capital rule, 12 CFR 567.6(a)(1)(v), to lower from 200 percent to 100 percent the risk-weight on all assets currently assigned to the 200 percent category. This amendment is consistent with the fair value accounting treatment adopted today. When the capital rules were promulgated in 1989, repossessed assets were assigned a 200 percent risk-weight because a savings association could carry such assets at the lower of cost or NRV.[5] Since the OTS is today eliminating the use of NRV in favor of fair value, it is appropriate to remove foreclosed assets from the 200 percent risk-weight category. Accordingly, foreclosed assets will be assigned a risk-weight of 100 percent.

The OTS's current capital rule also places all loans that are 90 days or more past due in the 200 percent risk-weight category except for 1 to 4 family residential mortgages, which are in the 100 percent risk-weight category. This risk-weighting treatment was intended to minimize any disincentive under the capital rules for thrifts to foreclose on properties. In recognition of the change in the risk-weight category for foreclosed assets, the OTS is also revising its capital rule to place loans 90 days or more past due in the 100 percent risk-weight category.[6]

C. Effective Date

Both of the actions taken today—the risk-weighting change to the OTS's capital regulations and the revision to OTS guidance on the valuation of foreclosed assets—are effective as of December 31, 1992. Regulatory reports prepared for periods ending on or after December 31, 1992, must, accordingly, reflect both changes. Neither of these actions is subject to the delayed effective date provision of the Administrative Procedure Act (APA).

The APA permits a regulation that relieves a restriction to become effective without a 30-day delay in its effective date. 5 U.S.C. 553(d)(1). The placement of assets formerly in the 200 percent risk-weight category into the 100 percent category falls within this exception. Accordingly, its effective date will not be delayed.

The OTS's revisions to its policy governing the valuation of foreclosed assets are subject to the APA provision authorizing interpretive rules and statements of policy to become effective without delay. 5 U.S.C. 553(d)(2). In addition, the OTS finds that good cause exists for its guidance on the valuation of foreclosed assets to take immediate effect.[7] SOP 92–3, "Accounting for Foreclosed Assets," must be applied by savings associations in preparing their annual financial statements for periods ending on or after December 15, 1992. The majority of, but not all, savings associations have calendar year-end fiscal years and, thus, will be required by GAAP to follow this SOP in

---

[3] The Financial Accounting Standards Board (FASB) has issued an exposure draft on accounting for impaired loans. "Proposed Statement of Financial Accounting Standards: Accounting by Creditors for Impairment of a Loan", File Reference No. 116–B, June 30, 1992. The OTS will address any final FASB action on this issue when it issues final guidance of the regulation of troubled, collateral-dependent loans.

[4] Fair value is to include a reduction for the seller's disposition costs.

[5] *See* 54 FR 48845, 48853 (Nov. 8, 1989).

[6] Given its decision to lower the risk-weight for the first two types of assets currently placed in the 200 percent category, that is, repossessed (or foreclosed) assets and assets more than 90 days past due, OTS has concluded that it is inappropriate to retain a 200 percent risk-weighting for the third type of asset—equity investments with the same risk characteristics as REO. If REO is risk-weighted at 100 percent, then assets having similar risk characteristics should carry the same risk-weight. Since no other assets are risk-weighted at 200 percent, it is appropriate to remove that risk-weighting category.

[7] *See* 5 U.S.C. 553(d)(3) (an agency may dispense with a delay in effective date for "good cause").

preparing their December 31, 1992 financial statements. An immediate effective date for the implementation of the fair value policy will cause the regulatory reports filed with the OTS by all savings associations to be consistent both with GAAP and with the treatment of these assets by the other federal banking regulatory agencies. A lack of uniformity would impede OTS's supervision of savings associations.

IV. Executive Order 12291

The OTS has determined that this regulation does not constitute a "major rule" and, therefore, the preparation of a regulatory impact analysis is not required. The impact on affected savings associations that results from the more stringent valuation methodology required for foreclosed assets will be substantially offset by removal of the 200 percent risk-weight category.

V. Regulatory Flexibility Analysis

Pursuant to section 605(b) of the Regulatory Flexibility Act, it is certified that this regulation will not have a significant impact on a substantial number of small savings associations. Any impact on small associations that results from the more stringent valuation methodology required for foreclosed assets will be substantially offset by removal of the 200 percent risk-weight category. Any impact on small savings associations will, accordingly, not be significant.

List of Subjects in 12 CFR Part 567

Capital, Reporting and recordkeeping requirements, Savings associations.

Accordingly, the Office of Thrift Supervision hereby amends part 567, chapter V, title 12, Code of Federal Regulations as set forth below.

SUBCHAPTER D—REGULATIONS APPLICABLE TO ALL SAVINGS ASSOCIATIONS

PART 567—CAPITAL

1. The authority citation for part 567 continues to read as follows:

Authority: 12 U.S.C. 1462, 1462a, 1463, 1464, 1476a.

2. Section 567.6 is amended by revising the section heading; by removing the period located at the end of paragraph (a)(1)(iv)(Q) and by adding in lieu thereof a semicolon; by adding new paragraphs (a)(1)(iv)(R) and (a)(1)(iv)(S); and by removing and reserving paragraph (a)(1)(v) to read as follows:

§ 567.6 Risk-based capital credit risk-weight categories.

(a) *Risk-weighted Assets.* * * *

(1) *On-balance Sheet Assets:* * * *

(iv) *100 percent Risk Weight (Category 4).* * *

(R) All repossessed assets or assets that are more than 90 days past due; and

(S) Equity investments that the Office determines have the same risk characteristics as foreclosed real estate by the savings association.

* * * * *

Dated: December 28, 1992.

By the Office of Thrift Supervision.

John F. Robinson,

Acting Director.

BILLING CODE 6720-01-M

RESOLUTION TRUST CORPORATION

12 CFR Part 1616

RIN 3205-AA14

Privacy Act Regulations

AGENCY: Resolution Trust Corporation.

ACTION: Final rule.

SUMMARY: The Resolution Trust Corporation (RTC or Corporation) is adopting a rule for the processing of requests for access to or amendment of records, other than the records of the RTC Inspector General, pursuant to the Privacy Act of 1974 (5 U.S.C. 552a). An interim rule with request for comments was published on September 22, 1992 (57 FR 43607).

EFFECTIVE DATES: This final rule is effective December 21, 1992.

FOR FURTHER INFORMATION CONTACT: Richard White, Privacy Act Program Officer, Office of the Secretary, FOIA/PA Branch, (703) 908-6137. (This is not a toll-free number.)

SUPPLEMENTARY INFORMATION: This rule governs release of all Corporate records, with the exception of the Office of Inspector General of the RTC, pursuant to the Privacy Act of 1974, as amended. This rule sets forth the procedures to be used in requesting records from the RTC, appealing the decision to deny, in whole or in part, access to Corporate records, the procedures for contesting the content of Corporate records, and the identification of systems of records that are exempt from the access, amendment, and disclosure accounting provisions of the Privacy Act. It also establishes a fee schedule for the duplication of Corporate records, and establishes a minimum amount under which fees will not be charged. No comments from members of the public were received. Appendix A of the rule has been amended to reflect the most current addresses of RTC field office locations.

List of Subjects in 12 CFR Part 1616

Privacy.

Accordingly, the interim rule adding part 1616 to title 12, chapter XVI, of the Code of Federal Regulations is amended and adopted as a final rule to read as follows:

PART 1616—PRIVACY ACT REGULATIONS

Sec.

Authority: 5 U.S.C. 552a.

§ 1616.1 Purpose and scope.

This part sets forth the basic policies of the Resolution Trust Corporation (RTC or Corporation), with the exception of the Office of Inspector General of the RTC, that implement the provisions of the Privacy Act of 1974 (5 U.S.C. 552a) regarding the protection of the privacy of individuals on whom the Corporation maintains information which is retrieved by reference to an individual's name or an identifying particular assigned to the individual. This part also sets forth the procedures by which an individual may seek access under the Privacy Act to records pertaining to him/her, may request amendment of such records, or may seek an accounting of disclosures of such records maintained by the Corporation.

§ 1616.2 Definitions.

For the purposes of this part:

(a) *Corporation* means the Resolution Trust Corporation operating in its Corporate capacity.

(b) *Individual* means a natural person who is either a citizen of the United States of America or an alien lawfully admitted for permanent residence.

(c) *Maintain* includes maintain, collect, use, disseminate, or control.

(d) *Record* means any item, collection or grouping of information about an individual that is maintained by the RTC in its Corporate capacity and contains his/her name, or an identifying number, symbol, or other identifying particular assigned to the individual.

(e) *System of records* means a group of any records under the control of the Corporation from which information is retrieved by the name of the individual or some identifying number, symbol or other identifying particular assigned to the individual.

(f) *Designated system of records* means a system of records which has been listed and summarized in the **Federal Register** pursuant to the requirements of 5 U.S.C. 552a(e).

(g) *Routine use* means, with respect to disclosure of a record, the use of such record for a purpose which is compatible with the purpose for which it was created.

(h) *Amend* and *amendment* mean any correction of, addition to or deletion from a record.

(i) *System manager* means the agency official responsible for a designated system of records, as denominated in the **Federal Register** publication of "Systems of Records Maintained by the Resolution Trust Corporation."

§ 1616.3 Procedures for requests pertaining to individual records in a system of records.

(a) Any present or former employee of the Federal Deposit Insurance Corporation (FDIC) who is working for or has worked for the RTC and who is seeking access to his/her official personnel folder or other U.S. Office of Personnel Management government-wide personnel-type record, including compensation, training, medical information, time and attendance and performance, maintained by the RTC in Corporation offices should submit his/her request in such a manner as prescribed by the U.S. Office of Personnel Management in part 297 of its rules and regulations (5 CFR 297.101 through 297.501). Such requests should be submitted to the Office of the Secretary, RTC, FOIA/PA Branch, International Place, 1735 North Lynn Street, Rosslyn, VA 22209. An FDIC employee who is presently working for the RTC may also gain access to his/her unofficial personnel folder, and other personnel-type record, by visiting, either in person or with an authorized representative, the RTC Corporate office in which the folder is maintained.

(b) Written requests by individuals for access to records pertaining to them, other than official personnel folders, and maintained within one of the Corporation's designated system of records should be submitted to the Office of the Secretary, FOIA/PA Branch, RTC, International Place, 1735 North Lynn Street, Rosslyn, VA 22209. Each such request should contain a reasonable description of the record(s) sought, identify the system or systems in which such records may be contained, and any additional identifying information, as specified in the Corporation's **Federal Register** "Notice of Systems of Records" for that particular system, copies of which are available upon request from the FOIA/PA Branch, Office of the Secretary.

§ 1616.4 Times, places and requirements for identification of individuals making requests.

(a) Individuals may request access to records pertaining to themselves as provided in § 1616.3 by submitting a written request by mail or in person to the office in which the records are maintained or the Office of the Secretary, FOIA/PA Branch, RTC, International Place, 1735 North Lynn Street, Rosslyn, VA 22209. Before access to records is granted, pursuant to this part, reasonable identification, as specified in § 1616.4(b), of the person making the request is required to ensure that information is given and records are disclosed only to the proper individual.

(b) Employees appearing in person at RTC offices seeking access to or amendment of personnel records pertaining to themselves shall present two forms of reasonable identification, such as employment identification cards, driver's licenses, passports, or credit cards. One piece of identification shall contain the individual's photograph and signature.

(c) Individuals submitting written requests seeking access to or amendment of records pertaining to themselves shall include copies of two forms of identification which contain the signatures of the individuals. Except for records that must be publicly disclosed pursuant to the Freedom of Information Act (5 U.S.C. 552), where the Corporation determines it to be necessary for the individual's protection, a certification of a duly commissioned notary public, of any state or territory, attesting to the requesting individual's identity may be required before a written request seeking access to or amendment of a record will be honored. Identification, as described in this section, will be required of any individuals visiting RTC offices to inspect records after submission of written requests.

§ 1616.5 Disclosure of requested information to individuals.

(a) Except to the extent that Corporation records in a system of records pertaining to an individual:

(1) Are exempt from disclosure under § 1616.14, or

(2) May require special procedures for medical records under § 1616.6, or

(3) Were compiled in reasonable anticipation of a civil action or proceeding, the Corporation will make such records available upon request for purposes of inspection and copying by the individual about whom the information is maintained or, upon the individual's request and written authorization, by another person of the individual's own choosing (after proper identity verification as provided in § 1616.4).

(b) The Secretary, or designee, will acknowledge receipt of a request submitted under this rule within ten (10) working days, and notify, in writing, the individual making a request, whenever practicable within ten business days following receipt of the request, whether any specified, designated system of records maintained by the Corporation contains a record pertaining to the individual. Where such a record does exist, the Secretary, or designee, with the advice of the System Manager, will inform the individual of the decision whether to grant or deny, in whole or in part, the request for access. In the event existing records are determined not to be disclosable, the notification will inform the individual of the reason(s) for which disclosure will not be made and will provide a description of the individual's right to appeal the denial, as more fully set forth in § 1616.9.

(c) Individuals will be granted access to records disclosable under this part 1616 as soon as is practicable. The Secretary, or designee, will give written notification of a reasonable period within which individuals may inspect disclosable records pertaining to themselves at the Office of the Secretary (FOIA/PA Branch) or the appropriate Headquarters, or field offices during normal business hours. Alternatively, the Corporation may mail copies of requested records to the individual. Fees for copying such records will be assessed as provided in § 1616.12.

§ 1616.6 Special procedures for medical records.

Medical records in a system of records shall be disclosed on request to individuals to whom they pertain, except, if in the judgment of the Corporation, the transmission of the medical information directly to the requesting individual could have an adverse effect upon such individual. In the event medical information is withheld from a requesting individual because of any possible adverse effect such information may have upon the individual, the Corporation shall transmit such information to a licensed medical doctor named by the requesting individual.

§ 1616.7 Requests for amendment of records.

The Corporation will maintain all records it uses in making any determination about any individual with such accuracy, relevance, timeliness, and completeness as is reasonably necessary to assure fairness to the individual in the determination. An individual may request that the Corporation amend any portion of a record pertaining to that individual which the Corporation maintains in a designated system of records. Such a request should be submitted in writing to the Office of the Secretary, FOIA/PA Branch, RTC, International Place, 1735 North Lynn Street, Rosslyn, VA 22209, and should contain the individual's reason for requesting the amendment and a description of the record (including the name of the appropriate designated system of records) sufficient to enable the Corporation to identify the particular record or portion thereof with respect to which amendment is sought. If an individual has a copy of the record he/she wishes to have amended, it should be attached to the request for amendment and the specific portion of the record sought to be amended should be clearly identified. The individual making the request may be required to provide the information specified in § 1616.4 to permit verification of the identify of the individual making the request for amendment.

§ 1616.8 Agency reviews of requests for amendment of records.

(a) Requests by individuals for the amendment of records will be acknowledged by the Secretary, or designee, within ten (10) business days following receipt of such requests and referred to the System Manager of the system of records in which the record is contained for an analysis of the request to amend. Promptly thereafter, the Secretary, or designee, with the advice of the System Manager, will notify the individual of the decision to grant or deny the request to amend. If the request to amend is granted in whole or in part, the Secretary, or designee, will effect the appropriate amendment.

(b) If the Secretary, or designee, denies a request to amend a record, the notification of such denial shall contain the reason(s) for the denial, a description of the individual's right to appeal the denial as more fully set forth in § 1616.9, and the address of the Corporation officer to whom the appeal should be sent.

§ 1616.9 Appeals of adverse initial agency determinations of access or amendment of records and Statements of Disagreement.

(a) For RTC records contained within a system of records, the initial denial of an individual's request for access to or amendment of a record pertaining to him/her may be appealed to the RTC's General Counsel within 30 business days following receipt of notification of the denial. Such appeals should be mailed to the Office of the Secretary, FOIA/PA Branch, RTC, International Place, 1735 North Lynn Street, Rosslyn, VA 22209, and contain all the information specified for requests for access in § 1616.3 or for initial requests to amend in § 1616.7, as well as any other additional information the individual deems relevant for the consideration by the General Counsel, or designee, of the appeal. Both the envelope and the appeal letter should have written on them "Privacy Act Appeal." The appeal letter should also enclose a copy of the initial denial letter.

(b) The General Counsel, or designee, will normally make a final determination with respect to an appeal made under this part within 30 business days following receipt of the appeal by the Office of the Secretary. The General Counsel, or designee may, however, extend this 30-day time period for good cause shown. When such an extension is required, the individual making the appeal will be notified of the reason for the extension and the expected date upon which a final decision will be given.

(c) If the General Counsel, or designee, affirms the initial denial of a request for access or amendment, he/she will inform the individual affected by the decision, the reason(s) therefore and the right of judicial review of the decision. With respect to a decision to sustain the initial refusal to amend a record, the General Counsel, or designee, will also inform the individual of the right to submit a Statement of Disagreement under paragraph (d) of this section.

(d) Upon receipt of a determination to affirm the initial denial of a request to amend a record, the individual may submit to the Corporation a concise statement (Statement of Disagreement) setting forth his or reasons for disagreeing with the Corporation's determination not to amend. Such a Statement of Disagreement will be attached to the record which was the subject of the request to amend. The General Counsel, or designee may, if deemed appropriate, prepare a concise statement (Statement of Explanation) of the reason(s) why the requested amendment was not made. Any RTC Statement of Explanation will be included in the system of records in the same manner as the Statement of Disagreement. A copy of the Statement of Explanation and the notation of the dispute as marked on the original record will be provided to the individual who requested an amendment of the record.

(e) When a record has been amended or when a Statement of Disagreement has been filed, the Secretary, or designee, will provide all prior recipients of the affected record, whose identities may be determined pursuant to the disclosure accountings required by the Privacy Act (5 U.S.C. 552a(c)) or any other accounting previously made, a copy of the amended or corrected record or the Statement of Disagreement. Any disclosure of disputed information occurring after a Statement of Disagreement has been filed will clearly identify the specific information disputed and be accompanied by a copy of the Statement of Disagreement and a copy of any RTC Statement of Explanation.

§ 1616.10 Preservation of records.

The Corporation will preserve all correspondence relating to the written requests it receives under this part, and all records processed pursuant to such requests, in accordance with the records retention provisions of General Records Schedule 14, Informational Services Records. Under no circumstances will records be destroyed while they are subject to a pending request for access, amendment, appeal, or lawsuit pursuant to the Privacy Act.

§ 1616.11 Disclosure of a record to a person other than the individual to whom the record pertains.

(a) Except as provided in paragraph (b) of this section, the Corporation will not disclose any record contained in a designated system of records to any person or agency except without the

prior written consent of the individual to whom the record pertains.

(b) The restrictions on disclosure in paragraph (a) of this section do not apply to any disclosures:

(1) To those officers and employees of the Corporation who have a need for the record in the performance of their duties;

(2) Required under the Freedom of Information Act (5 U.S.C. 552);

(3) For a routine use, as defined in § 1616.2(g), listed with respect to a designated system of records and described in the **Federal Register** notice of the system;

(4) To the Bureau of the Census for purposes of planning or carrying out a census or survey or related activity pursuant to the provisions of title 13 of the United States Code;

(5) To a recipient who has provided the Corporation with advance adequate written assurance that the record will be used solely as a statistical research or reporting record, and the record is to be transferred in a form that is not individually identifiable;

(6) To the National Archives and Records Administration as a record which has sufficient historical or other value to warrant its continued preservation by the United States Government, or for evaluation by the Archivist of the United States, or designee, to determine whether the record has such value;

(7) To another agency or to an instrumentality of any governmental jurisdiction within or under the control of the United States for a civil or criminal law enforcement activity if the activity is authorized by law, and if the head of the agency or instrumentality has made a written request to the Corporation specifying the particular portion desired and the law enforcement activity for which the record is sought;

(8) To a person pursuant to a showing of compelling circumstances affecting the health or safety of an individual if, upon such disclosure, notification is transmitted to the last known address of the individual to whom the record pertains;

(9) To either House of Congress, or, to the extent of matter within its jurisdiction, any committee or subcommittee thereof, any joint committee of Congress or subcommittee of any such joint committee;

(10) To the Comptroller General, or any of his/her authorized representatives, in the course of the performance of the duties of the General Accounting Office;

(11) Pursuant to the order of a court of competent jurisdiction; or

(12) To a consumer reporting agency in accordance with 31 U.S.C. 3711(f).

(c) Any Statement of Disagreement with the Corporation's determination not to amend a record, filed with the Corporation by an individual pursuant to § 1616.9(d) will be included in the disclosure of the record under authority of paragraph (b) of this section. The Corporation may, in its discretion, also include a copy of the Corporation's Statement of Explanation.

(d) The Corporation, with respect to each system of records under its control shall:

(1) Except for disclosures made under paragraphs (b)(1) or (b)(2) of this section, keep an accurate accounting of:

(i) The date, nature, and purpose of each disclosure of a record to any person or to another agency made under paragraph (b) of this section; and

(ii) The name and address of the person or agency to whom the disclosure is made; and

(2) Retain the accounting made under paragraph (d)(1) of this section for at least five years or the life of the record, whichever is longer, after the disclosure for which the accounting is made;

(3) Except for disclosures made under paragraph (b)(7) of this section, make the accounting made under paragraph (d)(1) of this section available to the individual named in the record at his/her request; and

(4) Inform any person or other agency about any correction or Statement of Dispute made by an individual in accordance with § 1616.9(d), of any record that has been disclosed to the person or agency if an accounting of the disclosure was made.

§ 1616.12 Fees.

The Corporation, upon a request for records disclosable pursuant to the Privacy Act of 1974 (5 U.S.C. 552a), shall charge a fee of $0.20 per page for duplicating, except as follows:

(a) If the Corporation determines that it can grant access to a record only by providing a copy of the record, no fee will be charged for providing the first copy of the record or any portion thereof; and

(b) Whenever the aggregate fees computed under this section do not exceed $25.00 for any one request, the fee will be deemed waived by the Corporation.

§ 1616.13 Penalties.

Any person who knowingly and willfully requests or obtains any record concerning an individual from the RTC under false pretenses shall be guilty of a misdemeanor and fined not more than $5,000.

§ 1616.14 Exemptions.

The following information is exempt from disclosure: (a) Investigatory material compiled for law enforcement purposes is exempt from §§ 1616.3 through 1616.9 and § 1616.11(d)(3), *Provided, however,* that if any individual is denied any right, privilege, or benefit to which he/she would otherwise be entitled under Federal law, or for which he/she would otherwise be eligible, as a result of the maintenance of such material, such material shall be disclosed to such individual, except to the extent that the disclosure of such material would reveal the identity of a source who furnished information to the Government under an express promise that the identity of the source would be held in confidence;

(b) Investigatory material compiled solely for the purpose of determining suitability, eligibility, or qualifications for Corporation employment to the extent that disclosure of such material would reveal the identity of a source who furnished information to the Corporation under an express promise that the identity of the source would be held in confidence, is exempt from §§ 1616.3 through 1616.9 and § 1616.11(d)(3); and

(c) Testing or examination material used solely to determine or assess individual qualifications for appointment or promotion in the Corporation's service, the disclosure of which would compromise the objectivity or fairness of the testing, evaluation, or examination process is exempt from §§ 1616.3 through 1616.9 and § 1616.11(d)(3).

BILLING CODE 6714–01–M

DEPARTMENT OF TRANSPORTATION

Federal Aviation Administration

14 CFR Part 39

[Docket No. 92–NM–235–AD; Amendment 39–8459; AD 93–01–05]

Airworthiness Directives; Boeing Model 747 Series Airplanes

AGENCY: Federal Aviation Administration, DOT.

ACTION: Final rule; request for comments.

SUMMARY: This amendment supersedes two existing airworthiness directives (AD), applicable to certain Boeing Model 747 series airplanes, that currently require repetitive inspections to detect cracks in forward and aft bottle bore fuse pins in the diagonal braces of the inboard engine struts, and replacement of cracked pins. Those AD's also provided for installation of forward 15–5 steel fuse pins or aft bulkhead fuse pins as optional terminating actions for the repetitive inspections. This amendment adds repetitive inspections of forward and aft bottle bore fuse pins in the outboard engine strut, and aft bulkhead fuse pins in the inboard and outboard engine struts. This AD also provides optional terminating action for certain repetitive inspections and adds airplanes to the applicability statement of the AD. This amendment is prompted by numerous reports of cracks and corrosion in certain fuse pins in the diagonal braces of the inboard and outboard engine struts. The actions specified in this AD are intended to prevent failure of the engine support structure and the inability of the strut to carry required engine operational loads.

DATES: Effective February 5, 1993.

The incorporation by reference of certain publications listed in the regulations is approved by the Director of the Federal Register as of February 5, 1993.

Comments for inclusion in the Rules Docket must be received on or before March 8, 1993.

ADDRESSES: Submit comments in triplicate to the Federal Aviation Administration (FAA), Transport Airplane Directorate, ANM–103, Attention: Rules Docket No. 92–NM–235–AD, 1601 Lind Avenue, SW., Renton, Washington 98055–4056.

The service information referenced in this AD may be obtained from Boeing Commercial Airplane Group, P.O. Box 3707, Seattle, Washington 98124–2207. This information may be examined at the FAA, Transport Airplane Directorate, 1601 Lind Avenue, SW., Renton, Washington; or at the Office of the Federal Register, 800 North Capitol Street, NW., suite 700, Washington, DC.

FOR FURTHER INFORMATION CONTACT: Mr. Tim Backman, Aerospace Engineer, Seattle Aircraft Certification Office, Airframe Branch, ANM–120S, FAA, Transport Airplane Directorate, 1601 Lind Avenue, SW., Renton, Washington 98055–4056; telephone (206) 227–2776; fax (206) 227–1181.

SUPPLEMENTARY INFORMATION: On August 5, 1981, the FAA issued AD 79–22–03 R3, Amendment 39–4176 (46 FR 38343, July 27, 1981), applicable to certain Model 747 series airplanes, to require:

1. Repetitive visual inspections at intervals of 350 landings, or ultrasonic inspections at intervals of 1,200 landings, to detect cracks and corrosion in forward bottle bore fuse pins in the diagonal braces of the inboard engine struts, and replacement of cracked pins; and

2. Application of corrosion preventive compound, and removal of any corrosion found.

That action also provided for installation of forward 15–5 steel fuse pins as an optional terminating action for the requirements of that AD. That action was prompted by a report of a completely fractured forward bottle bore fuse pin. The actions required by that AD are intended to prevent failure of the forward bottle bore fuse pins in the diagonal braces of the inboard engine struts.

Since the issuance of AD 79–22–03 R3, the FAA has received a total of 39 reports of cracking and two reports of complete fractures of forward bottle bore fuse pins. Boeing's analysis of several cracked forward bottle bore fuse pins indicates that cracking initiated at a sharp, circumferential machining groove in the fuse pin bore internal recess and was propagated by fatigue. The FAA notes that the same forward bottle bore fuse pin design is used on both inboard and outboard struts. In addition, these fuse pins operate in similar loads environments. Therefore, the FAA concludes that forward bottle bore fuse pins on the outboard struts, as well as the inboard struts, are subject to the same fatigue cracking.

One of the cracks discussed previously was found in a forward bottle bore fuse pin on an airplane that had accumulated only 192 landings since its last visual inspection. Critical crack length in these fuse pins is short; therefore, cracks cannot be detected using visual techniques before the pins would become fractured. Consequently, the FAA has determined that the option of performing visual inspections that is specified in the existing AD must be deleted, and repetitive ultrasonic inspections of these pins must be required.

On January 9, 1984, the FAA issued AD 83–24–05, Amendment 39–4775 (48 FR 54476, December 5, 1983), applicable to certain Model 747 series airplanes, to require repetitive visual inspections at intervals of 350 landings, or ultrasonic inspections at intervals of 1,200 landings, to detect cracks in aft bottle bore fuse pins in the diagonal braces of the inboard engine struts, and replacement of cracked pins. That AD also provided for installation of aft bulkhead fuse pins as an optional terminating action for the repetitive inspections. That AD was prompted by two reports of cracked aft bottle bore fuse pins. The actions required by that AD are intended to prevent failure of the aft bottle bore fuse pins in the diagonal braces of the inboard engine struts.

Since the issuance of AD 83–24–05, the FAA has received additional reports of cracks in aft fuse pins on the inboard and outboard engine struts. These reports involve both bottle bore and bulkhead fuse pins. Additionally, the FAA has received four reports of completely fractured aft bulkhead fuse pins.

Since cracks have been found on aft bulkhead fuse pins, as well as on aft bottle bore fuse pins, the FAA has determined that the installation of bulkhead fuse pins does not provide terminating action for the repetitive inspection requirements of AD 83–24–05. In addition, the FAA concludes that aft bulkhead fuse pins must be inspected to detect cracks and corrosion. Further, for reasons explained previously regarding AD 79–22–03 R3, both forward and aft bottle bore fuse pins must be inspected using ultrasonic, rather than visual, techniques. The applicability statement of this AD is expanded to include those airplanes equipped with bulkhead fuse pins. Additionally, since cracks in aft bottle bore fuse pins located in the outboard engine strut have been reported, inspections of both inboard and outboard struts are included in this AD.

The FAA has also determined that the repetitive ultrasonic inspection interval of 1,200 landings that is specified currently in both existing AD's must be reduced to 1,000 landings. This finding is based on an evaluation of additional crack growth data supplied by the manufacturer.

Cracks in these fuse pins could result in failure of the engine support structure

and the inability of the strut to carry required engine operational loads.

The FAA has reviewed and approved Boeing Alert Service Bulletin 747–54A2153, dated December 23, 1992, that describes procedures for repetitive inspections to detect cracks and corrosion in the forward and aft bottle bore fuse pins and the aft bulkhead fuse pins in the inboard and outboard engine struts; and replacement, if necessary. The service bulletin also describes procedures for installing a forward 15–5 steel fuse pin, which, if accomplished, eliminates the need for the repetitive inspections of the forward bottle bore fuse pins.

Since an unsafe condition has been identified that is likely to exist or develop on other airplanes of this same type design, this AD supersedes AD 79–22–03 R3 and AD 83–24–05 to require repetitive inspections to detect cracks and corrosion in (1) forward and aft bottle bore fuse pins, and (2) aft bulkhead fuse pins in the diagonal braces of the inboard and outboard engine struts; and replacement of pins, if necessary. This AD also provides terminating action for the repetitive inspections of forward bottle bore fuse pins in the diagonal braces of the inboard and outboard engine struts. The actions are required to be accomplished in accordance with the service bulletin described previously.

Since a situation exists that requires the immediate adoption of this regulation, it is found that notice and opportunity for prior public comment hereon are impracticable, and that good cause exists for making this amendment effective in less than 30 days.

Comments Invited

Although this action is in the form of a final rule that involves requirements affecting flight safety and, thus, was not preceded by notice and an opportunity for public comment, comments are invited on this rule. Interested persons are invited to comment on this rule by submitting such written data, views, or arguments as they may desire. Communications shall identify the Rules Docket number and be submitted in triplicate to the address specified under the caption "ADDRESSES." All communications received on or before the closing date for comments will be considered, and this rule may be amended in light of the comments received. Factual information that supports the commenter's ideas and suggestions is extremely helpful in evaluating the effectiveness of the AD action and determining whether additional rulemaking action would be needed.

Comments are specifically invited on the overall regulatory, economic, environmental, and energy aspects of the rule that might suggest a need to modify the rule. All comments submitted will be available, both before and after the closing date for comments, in the Rules Docket for examination by interested persons. A report that summarizes each FAA-public contact concerned with the substance of this AD will be filed in the Rules Docket.

Commenters wishing the FAA to acknowledge receipt of their comments submitted in response to this notice must submit a self-addressed, stamped postcard on which the following statement is made: "Comments to Docket Number 92–NM–235–AD." The postcard will be date stamped and returned to the commenter.

The regulations adopted herein will not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government. Therefore, in accordance with Executive Order 12612, it is determined that this final rule does not have sufficient federalism implications to warrant the preparation of a Federalism Assessment.

The FAA has determined that this regulation is an emergency regulation and that it is not considered to be major under Executive Order 12291. It is impracticable for the agency to follow the procedures of Order 12291 with respect to this rule since the rule must be issued immediately to correct an unsafe condition in aircraft. It has been determined further that this action involves an emergency regulation under DOT Regulatory Policies and Procedures (44 FR 11034, February 26, 1979). If it is determined that this emergency regulation otherwise would be significant under DOT Regulatory Policies and Procedures, a final regulatory evaluation will be prepared and placed in the Rules Docket. A copy of it, if filed, may be obtained from the Rules Docket at the location provided under the caption "ADDRESSES."

List of Subjects in 14 CFR Part 39

Air transportation, Aircraft, Aviation safety, Incorporation by reference, Safety.

Adoption of the Amendment

Accordingly, pursuant to the authority delegated to me by the Administrator, the Federal Aviation Administration amends 14 CFR part 39 of the Federal Aviation Regulations as follows:

PART 39—AIRWORTHINESS DIRECTIVES

1. The authority citation for part 39 continues to read as follows:

Authority: 49 U.S.C. App. 1354(a), 1421 and 1423; 49 U.S.C. 106(g); and 14 CFR 11.89.

§ 39.13 [Amended]

2. Section 39.13 is amended by removing amendment 39–4176 (46 FR 38343, July 27, 1981) and amendment 39–4775 (48 FR 54476, December 5, 1983), and by adding a new airworthiness directive (AD), amendment 39–8459, to read as follows:

93–01–05 Boeing: Amendment 39–8459. Docket 92–NM–235–AD. Supersedes AD 79–22–03 R3, Amendment 39–4176; and AD 83–24–05, Amendment 39–4775.

Applicability: All Model 747 series airplanes, certificated in any category.

Compliance: Required as indicated, unless accomplished previously.

To prevent failure of the engine support structure and the inability of the strut to carry required engine operational loads, accomplish the following:

(a) For all Model 747 series airplanes, except JT9D–70-equipped airplanes: Inspect the forward bottle bore fuse pins in the rear diagonal brace of the inboard nacelle struts in accordance with paragraph (a)(1) or (a)(2) of this AD.

(1) Within 100 landings after August 5, 1981 (the effective date of AD 79–22–03 R3, Amendment 39–4176), unless accomplished already within the last 250 landings, but not to exceed 1,200 landings from the previous inspection: Remove the retainer bolt and end caps from the fuse pins, part numbers 65B94182–3, 69B904010–1, –3, –4, –600, and 69B89612–3, and perform a visual inspection of the fuse pins to detect cracks in the machined shear section, in accordance with Boeing Service Bulletin 747–54–2066, dated November 7, 1979; Revision 1, dated October 10, 1980; or Revision 2, dated July 16, 1982. Repeat that inspection thereafter at intervals not to exceed 350 landings until the inspection required by paragraph (e) of this AD is accomplished.

(2) Within 100 landings after August 5, 1981 (the effective date of AD 79–22–03 R3, Amendment 39–4176), unless accomplished already within the last 1,100 landings, but not to exceed 1,200 landings from the previous inspection: Remove the retainer bolt and end caps from the fuse pins, part numbers 65B94182–3, 69B904010–1, –3, –4, –600, and 69B89612–3, and perform an ultrasonic inspection of the fuse pins to detect cracks in the machined shear section, in accordance with Boeing Service Bulletin 747–54–2066, dated November 7, 1979; Revision 1, dated October 10, 1980; or Revision 2, dated July 16, 1982. Repeat that inspection thereafter at intervals not to exceed 1,200 landings until the inspection required by paragraph (e) of this AD is accomplished.

(b) After the effective date of this AD, perform the repetitive inspections required

by paragraph (a) of this AD only in accordance with the ultrasonic inspection method referenced in paragraph (a) of this AD.

(c) For Model 747 series airplanes listed in Boeing Service Bulletin 747–54–2101, dated April 11, 1983: Prior to the accumulation of 5,000 landings, or within 350 landings after January 9, 1984 (the effective date of AD 83–24–05, Amendment 39–4775), whichever occurs later, perform a visual or an ultrasonic inspection for cracks in the aft bottle bore fuse pin bore in recessed shear plane areas, in accordance with Boeing Service Bulletin 747–54–2101, dated April 11, 1983; or Revision 1, dated June 1, 1984. Repeat that inspection thereafter at intervals not to exceed 350 landings (if the previous inspection was visual) or 1,200 landings (if the previous inspection was ultrasonic) until the inspection required by paragraph (f) of this AD is accomplished.

(d) After the effective date of this AD, perform the repetitive inspections required by paragraph (b) of this AD only in accordance with the ultrasonic inspection method referenced in paragraph (b).

(e) For diagonal brace forward bottle bore fuse pins: Perform an ultrasonic inspection to detect cracks and a detailed visual inspection to detect corrosion in the forward bottle bore fuse pins located in the diagonal braces on the inboard and outboard engine struts from each end of the pin, in accordance with Boeing Alert Service Bulletin 747–54A2153, dated December 23, 1992, at the time specified in paragraph (e)(1) of this AD. Accomplishment of this inspection terminates the repetitive inspection requirements of paragraph (a) of this AD. Thereafter, repeat these inspections at intervals not to exceed 1,000 landings.

(1) Inspect all engine positions at the later of the times specified in paragraphs (e)(1)(i) and (e)(1)(ii) of this AD:

(i) Prior to the accumulation of 3,000 landings after the effective date of this AD, or within 3 years since pin installation, whichever occurs first, or

(ii) Within 90 days after the effective date of this AD.

Note: This AD does not require that these inspections be performed on forward 15–5 steel fuse pins or forward H–11 steel bolts in the diagonal brace.

(2) If any crack or corrosion is found as a result of the inspections required by paragraph (e) of this AD, prior to further flight, replace the cracked or corroded pin with a forward 15–5 steel fuse pin, in accordance with Boeing Alert Service Bulletin 747–54A2153, dated December 23, 1992. Installation of a forward 15–5 steel fuse pin constitutes terminating action for the repetitive inspections required by paragraph (e) of this AD.

(f) For diagonal brace aft bottle bore fuse pins and aft bulkhead fuse pins: Perform an ultrasonic inspection to detect cracks, and a detailed visual inspection to detect corrosion, in the aft bottle bore and aft bulkhead fuse pins in the diagonal brace on the inboard and outboard engine struts from each end of the pin, in accordance with Boeing Alert Service Bulletin 747–54A2153, dated December 23, 1992, at the time specified in paragraph (f)(1) of this AD. Accomplishment of this inspection terminates the repetitive inspection requirements of paragraph (c) of this AD.

(1) Inspect all engine positions at the later of the times specified in paragraphs (f)(1)(i) and (f)(1)(ii) of this AD:

(i) Prior to the accumulation of 3,000 landings after the effective date of this AD, or within 3 years since pin installation, whichever occurs first, or

(ii) Within 90 days after the effective date of this AD.

(2) If any crack is found as a result of the inspections required by paragraph (f) of this AD, prior to further flight, replace the cracked pin with an aft bulkhead fuse pin, in accordance with Boeing Alert Service Bulletin 747–54A2153, dated December 23, 1992. Thereafter, accomplish the initial inspection required by paragraph (f) of this AD on the newly installed aft bulkhead fuse pin.

(3) If any corrosion is found as a result of the inspections required by paragraph (f) of this AD, prior to further flight, accomplish paragraph (f)(3)(i) or (f)(3)(ii) of this AD, as applicable.

(i) If corrosion is found in any aft bottle bore fuse pin: Replace with an aft bulkhead fuse pin, in accordance with Boeing Alert Service Bulletin 747–54A2153, dated December 23, 1992.

(ii) If corrosion is found in any aft bulkhead fuse pin: Accomplish paragraph (f)(3)(ii)(A), (f)(3)(ii)(B), or (f)(3)(ii)(C) of this AD, as applicable.

(A) If the amount of corroded material that must be removed exceeds the limit specified in Figure 8 of the service bulletin, replace the corroded fuse pin with an aft bulkhead fuse pin, in accordance with the service bulletin. Thereafter, accomplish the initial inspection required by paragraph (f) of this AD on the newly-installed aft bulkhead fuse pin.

(B) If the amount of corroded material that must be removed is more than light, and equal to or less than the limit specified in Figure 8 of the service bulletin, rework the corroded fuse pin, or replace the corroded fuse pin with an aft bulkhead fuse pin, in accordance with the service bulletin. "Light" corrosion is characterized by discoloration or pitting to a depth of not more than 0.001-inch maximum. This type of corrosion can be removed normally by light hand sanding. A fuse pin that has been reworked in accordance with Figure 8 of the service bulletin must be replaced with an aft bulkhead fuse pin prior to the accumulation of 3,000 landings on the pin, or 3 years since the pin was reworked and reinstalled, whichever occurs first.

(C) If the corrosion is light, remove the corroded material from the fuse pin in accordance with the service bulletin. Thereafter, accomplish the repetitive inspections required by paragraph (f)(4) of this AD.

(4) Repeat the inspections required by paragraph (f) of this AD at the intervals specified in paragraph (f)(4)(i) or (f)(4)(ii) of this AD, as applicable:

(i) For aft bottle bore fuse pins: Repeat at intervals not to exceed 1,000 landings.

(ii) For aft bulkhead fuse pins: Repeat at intervals not to exceed 2,000 landings.

(g) An alternative method of compliance or adjustment of the compliance time that provides an acceptable level of safety may be used if approved by the Manager, Seattle Aircraft Certification Office (ACO), FAA, Transport Airplane Directorate. Operators shall submit their requests through an appropriate FAA Principal Maintenance Inspector, who may add comments and then send it to the Manager, Seattle ACO.

Note: Information concerning the existence of approved alternative methods of compliance with this AD, if any, may be obtained from the Seattle ACO.

(h) Special flight permits may be issued in accordance with FAR 21.197 and 21.199 to operate the airplane to a location where the requirements of this AD can be accomplished.

(i) The inspections, replacement, and repair shall be done in accordance with the following Boeing service bulletins, as applicable, which contain the specified effective pages:

Service bulletin referenced and date	Page No.	Revision level shown on page	Date shown on page
747–54–2066, November 7, 1979	1–7	Original	November 7, 1979.
747–54–2066, Revision 1, October 10, 1980	1–27	1	October 10, 1980.
747–54–2066, Revision 2, July 16, 1982	1–17, 20, 27	2	July 16, 1982.
	18–19, 21–16	1	October 10, 1980.
747–54–2101, April 11, 1983	1–27	Original	April 11, 1983.
747–54–2101, Revision 1, June 1, 1984	1–23	1	June 1, 1984.
747–54A2153, December 23, 1992	1–56	Original	December 23, 1992.

This incorporation by reference was approved by the Director of the Federal Register in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. Copies may be obtained from Boeing Commercial Airplane Group, P.O. Box 3707, Seattle, Washington 98124–2207. Copies may be inspected at the FAA, Transport Airplane Directorate, 1601 Lind Avenue, SW., Renton, Washington; or at the

Office of the Federal Register, 800 North Capitol Street, NW., suite 700, Washington, DC.

(j) This amendment becomes effective on February 5, 1993.

Issued in Renton, Washington, on December 24, 1992.

James V. Devany,

Acting Manager, Transport Airplane Directorate, Aircraft Certification Service.

BILLING CODE 4910–13–U

14 CFR Part 39

[Docket No. 92–NM–234–AD; Amendment 39–8458; AD 93–01–04]

Airworthiness Directives; Boeing Model 747 Series Airplanes

AGENCY: Federal Aviation Administration, DOT.

ACTION: Final rule; request for comments.

SUMMARY: This amendment supersedes an existing airworthiness directive (AD), applicable to certain Boeing Model 747 series airplanes, that currently requires repetitive ultrasonic inspections to detect cracks in the inboard and outboard midspar fitting lugs or spring beam aft lugs of each strut, and replacement of midspar fittings or spring beams, if necessary. This amendment reduces certain inspection intervals, removes the optional terminating action for repetitive inspections of the lugs, and adds airplanes to the applicability of the AD. This amendment is prompted by seven reports of fatigue cracking on lugs and numerous reports of lug bushing migration. The actions specified in this AD are intended to prevent failure of the engine support structure and the inability of the strut to carry required engine support loads.

DATES: Effective February 5, 1993.

The incorporation by reference of certain publications listed in the regulations is approved by the Director of the Federal Register as of February 5, 1993.

Comments for inclusion in the Rules Docket must be received on or before March 8, 1993.

ADDRESSES: Submit comments in triplicate to the Federal Aviation Administration (FAA), Transport Airplane Directorate, ANM–103, Attention: Rules Docket No. 92–NM–234–AD, 1601 Lind Avenue, SW., Renton, Washington 98055–4056.

The service information referenced in this AD may be obtained from Boeing Commercial Airplane Group, P.O. Box 3707, Seattle, Washington 98124–2207. This information may be examined at the FAA, Transport Airplane Directorate, 1601 Lind Avenue, SW., Renton, Washington; or at the Office of the Federal Register, 800 North Capitol Street, NW., suite 700, Washington, DC.

FOR FURTHER INFORMATION CONTACT: Mr. Tim Backman, Aerospace Engineer, Seattle Aircraft Certification Office, Airframe Branch, ANM–120S, FAA, Transport Airplane Directorate, 1601 Lind Avenue, SW., Renton, Washington 98055–4056; telephone (206) 227–2776; fax (206) 227–1181.

SUPPLEMENTARY INFORMATION: On October 10, 1985, the FAA issued AD 85–22–07, Amendment 39–5153 (50 FR 42146, October 18, 1985), to require repetitive ultrasonic inspections to detect cracks in the inboard and outboard midspar fitting lugs or spring beam aft lugs of each strut, and replacement of midspar fittings or spring beams, if necessary. That action was prompted by a report of the failure of both lugs on the inboard midspar fitting of an inboard strut on a Boeing Model 747 series airplane that had accumulated approximately 44,000 flight hours and 11,300 landings. The actions required by that AD are intended to prevent failure of the strut midspar fitting lugs or spring beam aft lugs.

Since the issuance of that AD, the FAA has received seven reports of fatigue cracking on lugs. One of these reports involved a failed lug that was found on the inboard midspar fitting of an inboard strut on a Model 747 series airplane that had accumulated 1,724 landings since its last ultrasonic inspection accomplished in accordance with AD 85–22–07. The FAA concludes that the repetitive inspection interval must be reduced from the currently required 3,000 landings to 1,000 landings in order to adequately address cracking of the midspar fitting lugs.

Although the operational loads environment of the spring beam aft lugs is similar to that of the midspar fitting lugs, there have been no reports of cracks in the spring beam aft lugs. Therefore, the FAA concludes that the existing inspection interval of 3,000 landings is adequate to address cracking of these spring beam aft lugs.

Two types of bushings are installed currently on Model 747 series airplanes: (1) Press-fit bushings, and (2) roller-swaged, shrink-fitted bushings. Recently, the FAA has received numerous reports of migration of press-fit and roller-swaged, shrink-fitted bushings. The FAA has determined that migration of the bushings could result in moisture ingression and subsequent corrosion of the lugs. Operator reports indicate that lug cracking initiated from corrosion pits. Cracking of the lugs, if not detected and corrected, could result in failure of the engine support structure and the inability of the strut to carry required engine support loads.

The FAA has reviewed and approved Boeing Alert Service Bulletin 747–54A2152, dated December 23, 1992, which describes procedures for repetitive ultrasonic inspections to detect cracks on the inboard and outboard midspar fitting lugs or spring beam aft lugs of each strut, and replacement of midspar fittings or spring beams, if necessary. The service bulletin also describes repetitive detailed visual inspections of the inboard and outboard struts to detect bushing migration and corrosion, and repair, if necessary.

In light of the recent reports discussed previously, the FAA has determined that the initial and repetitive inspection intervals for ultrasonic inspections of the midspar fitting lugs, as specified currently in AD 85–22–07, must be reduced.

That AD also specifies that installation of roller-swaged, shrink-fitted bushings constitutes terminating action for repetitive ultrasonic inspections of the lugs. However, since reports of the migration of roller-swaged, shrink-fitted bushings have been received, the FAA has determined that a detailed visual inspection to detect migration of these bushings is necessary.

Roller-swaged, shrink-fitted bushings that have migrated are susceptible to the addressed unsafe condition and are subject to the requirements of this AD. Therefore, those airplanes equipped with roller-swaged, shrink-fitted bushings are included in the applicability statement of this AD.

Since an unsafe condition has been identified that is likely to exist or develop on other airplanes of this same type design, this AD supersedes AD 85–22–07 to require repetitive ultrasonic inspections to detect cracks on the inboard and outboard midspar fitting lugs or spring beam aft lugs of each strut, and replacement of midspar fittings or spring beams, if necessary. This AD also requires repetitive detailed visual inspections of the inboard and outboard struts to detect bushing migration and corrosion, and repair, if necessary.

Currently, the FAA is conducting a review of the wing-to-strut attachment structure on Boeing Model 747 series airplanes and may consider further rulemaking as additional data becomes available.

Since a situation exists that requires the immediate adoption of this regulation, it is found that notice and opportunity for prior public comment hereon are impracticable, and that good cause exists for making this amendment effective in less than 30 days.

Comments Invited

Although this action is in the form of a final rule that involves requirements affecting flight safety and, thus, was not preceded by notice and an opportunity for public comment, comments are invited on this rule. Interested persons are invited to comment on this rule by submitting such written data, views, or arguments as they may desire. Communications shall identify the Rules Docket number and be submitted in triplicate to the address specified under the caption "ADDRESSES." All communications received on or before the closing date for comments will be considered, and this rule may be amended in light of the comments received. Factual information that supports the commenter's ideas and suggestions is extremely helpful in evaluating the effectiveness of the AD action and determining whether additional rulemaking action would be needed.

Comments are specifically invited on the overall regulatory, economic, environmental, and energy aspects of the rule that might suggest a need to modify the rule. All comments submitted will be available, both before and after the closing date for comments, in the Rules Docket for examination by interested persons. A report that summarizes each FAA-public contact concerned with the substance of this AD will be filed in the Rules Docket.

Commenters wishing the FAA to acknowledge receipt of their comments submitted in response to this notice must submit a self-addressed, stamped postcard on which the following statement is made: "Comments to Docket Number 92–NM–234–AD." The postcard will be date stamped and returned to the commenter.

The regulations adopted herein will not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government. Therefore, in accordance with Executive Order 12612, it is determined that this final rule does not have sufficient federalism implications to warrant the preparation of a Federalism Assessment.

The FAA has determined that this regulation is an emergency regulation and that it is not considered to be major under Executive Order 12291. It is impracticable for the agency to follow the procedures of Order 12291 with respect to this rule since the rule must be issued immediately to correct an unsafe condition in aircraft. It has been determined further that this action involves an emergency regulation under DOT Regulatory Policies and Procedures (44 FR 11034, February 26, 1979). If it is determined that this emergency regulation otherwise would be significant under DOT Regulatory Policies and Procedures, a final regulatory evaluation will be prepared and placed in the Rules Docket. A copy of it, if filed, may be obtained from the Rules Docket at the location provided under the caption "ADDRESSES."

Air transportation, Aircraft, Aviation safety, Incorporation by reference, Safety.

Adoption of the Amendment

Accordingly, pursuant to the authority delegated to me by the Administrator, the Federal Aviation Administration amends 14 CFR part 39 of the Federal Aviation Regulations as follows:

PART 39—AIRWORTHINESS DIRECTIVES

1. The authority citation for part 39 continues to read as follows:

Authority: 49 U.S.C. App. 1354(a), 1421 and 1423; 49 U.S.C. 106(g); and 14 CFR 11.89.

§ 39.13 [Amended]

2. Section 39.13 is amended by removing amendment 39–5153 (50 FR 42146, October 10, 1985), and by adding a new airworthiness directive (AD), amendment 39–8458, to read as follows:

93–01–04 Boeing: Amendment 39–8458. Docket 92–NM–234–AD. Supersedes AD 85–22–07, Amendment 39–5153.

Applicability: All Model 747 series airplanes, certificated in any category.

Compliance: Required as indicated, unless accomplished previously.

Note: Paragraph (a) of this AD restates the inspection requirements of AD 85–22–07, Amendment 39–5153. As allowed by the phrase, "unless accomplished previously," if the initial inspection requirements of AD 85–22–07 have been accomplished previously, paragraph (a) of this AD does not require the initial inspection to be repeated.

To prevent failure of the engine support structure and the inability of the strut to carry required engine support loads, accomplish the following:

(a) For Model 747 series airplanes listed in Boeing Service Bulletin 747–54–2100, dated June 20, 1983: Perform an ultrasonic inspection of the inboard and outboard midspar fitting lugs or spring beam aft lugs of each strut for cracks, in accordance with Boeing Service Bulletin 747–54–2100, dated June 20, 1983; Revision 1, dated August 25, 1988; Revision 2, dated July 20, 1989; or Revision 3, dated November 16, 1989; at the time specified in paragraph (a)(1), (a)(2), (a)(3), or (a)(4) of this AD. Repeat that inspection thereafter at intervals not to exceed 3,000 landings until the inspection required by paragraph (b) of this AD is accomplished.

(1) For airplanes that have accumulated less than 30,000 flight hours as of November 24, 1985 (the effective date of AD 85–22–07, Amendment 39–5153), inspect within 18 months after November 24, 1985, or prior to the accumulation of 25,000 flight hours, whichever occurs later.

(2) For airplanes that have accumulated 30,000 or more flight hours, but less than 40,000 flight hours, as of November 24, 1985 (the effective date of AD 85–22–07, Amendment 39–5153), inspect within 12 months after November 24, 1985.

(3) For airplanes that have accumulated 40,000 or more flight hours as of November 24, 1985 (the effective date of AD 85–22–07, Amendment 39–5153), inspect within 6 months after November 24, 1985.

(4) For airplanes on which the midspar fitting or its lug bushings have been replaced, or on which the spring beam or its aft lug bushings have been replaced, inspect those lugs within 18 months after November 24, 1985 (the effective date of AD 85–22–07, Amendment 39–5153), or within 25,000 flight hours after such replacement, whichever occurs later.

(b) For airplanes equipped with midspar fittings with press-fit bushings; and for airplanes equipped with spring beam lugs with press-fit bushings, as listed in Boeing Alert Service Bulletin 747–54A2152, dated December 23, 1992: Perform an ultrasonic inspection of the midspar fitting lugs or spring beam aft lugs of each strut for cracks, and a detailed visual inspection for corrosion of the lugs and bushing migration, in accordance with Boeing Alert Service Bulletin 747–54A2152, dated December 23, 1992, at the applicable times specified in paragraphs (b)(1) and (b)(2) of this AD. Accomplishment of this inspection terminates the repetitive inspection requirement of paragraph (a) of this AD.

(1) Inspect inboard engine positions 2 and 3 at the later of the times specified in paragraph (b)(1)(i) or (b)(1)(ii) of this AD:

(i) Prior to the accumulation of 5,000 landings on the midspar fitting lugs or spring beam, or within 5 years since installation, whichever occurs first. Or

(ii) Within 60 days after the effective date of this AD.

(2) Inspect outboard engine positions 1 and 4 at the later of the times specified in paragraph (b)(2)(i) or (b)(2)(ii) of this AD:

(i) Prior to the accumulation of 5,000 landings on the midspar fitting lugs or spring beam, or within 5 years since installation, whichever occurs first. Or

(ii) Within 90 days after the effective date of this AD.

(c) For airplanes having midspar fittings or spring beam lugs delivered with roller-

swaged, shrink-fitted bushings, as listed in Boeing Alert Service Bulletin 747–54A2152, dated December 23, 1992, or installed in accordance with Boeing Service Bulletin 747–54–2100, dated June 20, 1983; Revision 1, dated August 25, 1988; Revision 2, dated July 20, 1989; or Revision 3, dated November 16, 1989: Perform a detailed visual inspection of the midspar fitting lugs or spring beam aft lugs of each strut for corrosion of the lugs and bushing migration, in accordance with Boeing Alert Service Bulletin 747–54A2152, dated December 23, 1992, at the later of the times specified in paragraphs (c)(1) and (c)(2) of this AD.

(1) Prior to the accumulation of 5,000 landings on the midspar fitting lugs or spring beam, or within 5 years since installation, whichever occurs first. Or

(2) Within 90 days after the effective date of this AD.

(d) If any migrated bushing is found as a result of the inspection of lugs with roller-swaged, shrink-fitted bushings required by paragraph (c) of this AD, prior to further flight, perform an ultrasonic inspection of the midspar fitting lugs or spring beam aft lugs for cracks, in accordance with Boeing Alert Service Bulletin 747–54A2152, dated December 23, 1992.

(e) If any crack is found in the lugs as a result of any inspection required by paragraph (b), (c), or (d) of this AD, prior to further flight, replace the affected midspar fitting or spring beam in accordance with Boeing Service Bulletin 747–54–2100, dated June 20, 1983; Revision 1, dated August 25, 1988; Revision 2, dated July 20, 1989; or Revision 3, dated November 16, 1989.

(f) If any migrated bushing is found as a result of any inspection required by paragraph (b) or (c) of this AD, prior to further flight, re-seal the bushing in accordance with Boeing Alert Service Bulletin 747–54A2152, dated December 23, 1992. Prior to the accumulation of 1,000 additional landings after detecting the migrated bushing, re-work the fitting in accordance with Figure 5 of the service bulletin.

(g) If any corrosion is found as a result of any inspection required by paragraph (b) or (c) of this AD, prior to further flight, remove the corrosion in accordance with Boeing Alert Service Bulletin 747–54A2152, dated December 23, 1992.

(h) Repeat the inspections required by paragraphs (b) and (c) of this AD at the applicable time specified in paragraph (h)(1) or (h)(2) of this AD.

(1) For midspar fitting lugs, as listed in Boeing Alert Service Bulletin 747–54A2152, dated December 23, 1992: At intervals not to exceed 1,000 landings. Or

(2) For spring beam aft lugs, as listed in Boeing Alert Service Bulletin 747–54A2152, dated December 23, 1992: At intervals not to exceed 3,000 landings.

(i) An alternative method of compliance or adjustment of the compliance time that provides an acceptable level of safety may be used if approved by the Manager, Seattle Aircraft Certification Office (ACO), FAA, Transport Airplane Directorate. Operators shall submit their requests through an appropriate FAA Principal Maintenance Inspector, who may add comments and then send it to the Manager, Seattle ACO.

Note: Information concerning the existence of approved alternative methods of compliance with this AD, if any, may be obtained from the Seattle ACO.

(j) Special flight permits may be issued in accordance with FAR 21.197 and 21.199 to operate the airplane to a location where the requirements of this AD can be accomplished.

(k) The inspections, replacement, and repair shall be done in accordance with the following Boeing service bulletins, as applicable, which contain the specified effective pages:

Service bulletin referenced and date	Page No.	Revision level shown on page	Date shown on page
747–54–2100, June 20, 1983	1–153	Original	June 20, 1983.
747–54–2100, Revision 1, August 25, 1988	1–6, 8–9, 24, 27, 33, 70	1	August 25, 1988.
	7, 10–23, 25–26, 28–32, 34–69, 71–153.	Original	June 20, 1983.
747–54–2100, Revision 2, July 20, 1989	1–6, 8–11, 16, 21	2	July 20, 1989.
	24, 27, 33, 70	1	August 25, 1988.
	7, 12–15, 17–20, 22–23, 25–26, 28–32, 34–69, 71–153.	Original	June 20, 1983.
747–54–2100, Revision 3, November 16, 1989	1–6, 8–11, 16, 26–27, 32	3	November 16, 1989.
	21	2	July 20, 1989.
	24, 33, 70	1	August 25, 1988.
	7, 12–15, 17–20, 22–23, 25, 28–31, 34–69, 71–153.	Original	June 20, 1983.
747–54A2152, December 23, 1992	1–49	Original	December 23, 1992.

This incorporation by reference was approved by the Director of the Federal Register in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. Copies may be obtained from Boeing Commercial Airplane Group, P.O. Box 3707, Seattle, Washington 98124–2207. Copies may be inspected at the FAA, Transport Airplane Directorate, 1601 Lind Avenue, SW., Renton, Washington; or at the Office of the Federal Register, 800 North Capitol Street, NW., suite 700, Washington, DC.

(l) This amendment becomes effective on February 5, 1993.

Issued in Renton, Washington, on December 24, 1992.

James V. Devany,

Acting Manager, Transport Airplane Directorate, Aircraft Certification Service.

BILLING CODE 4910–13–U

DEPARTMENT OF COMMERCE

Bureau of Export Administration

15 CFR Parts 771, 773, 774, 776, 779, and 785

[Docket No. 921082–2282]

Exports to Afghanistan; Special Country Policies

AGENCY: Bureau of Export Administration, Commerce.

ACTION: Final rule.

SUMMARY: On June 3, 1980, the Department of Commerce announced that in response to the Soviet invasion of Afghanistan, applications for licenses to export to Afghanistan were being reviewed on the assumption that commodities and technical data sent to that country would be available to the U.S.S.R. (45 FR 37415). Validated licensing requirements for Afghanistan were therefore made virtually identical to those in force for the U.S.S.R. However, since that time the Soviet military withdrew from Afghanistan, and the Department of State has determined that there is no longer a need for this special treatment of Afghanistan. The Bureau of Export Administration is therefore amending the Export Administration Regulations (EAR) to correctly reflect this change in policy.

EFFECTIVE DATE: This rule is effective on January 6, 1993.

FOR FURTHER INFORMATION CONTACT:

David Schlechty, Foreign Policy Branch, Office of Technology and Policy Analysis, Bureau of Export Administration, Telephone: (202) 482–4252.

SUPPLEMENTARY INFORMATION:

Rulemaking Requirements

1. This rule is consistent with Executive Orders 12291 and 12661.

2. This rule involves collections of information subject to the Paperwork Reduction Act of 1980 (44 U.S.C. 3501 *et seq.*). These collections have been approved by the Office of Management and Budget under control numbers 0694–0005 and 0694–0010. This rule may slightly increase the number of export license applications.

3. This rule does not contain policies with Federalism implications sufficient to warrant preparation of a Federalism assessment under Executive Order 12612.

4. Because a notice of proposed rulemaking and an opportunity for public comment are not required to be given for this rule by section 553 of the Administrative Procedure Act (5 U.S.C. 553) or by any other law, under section 3(a) of the Regulatory Flexibility Act (5 U.S.C. 603(a) and 604(a)) no initial or final Regulatory Flexibility Analysis has to be or will be prepared.

5. The provisions of the Administrative Procedure Act (5 U.S.C. 553) requiring notice of proposed rulemaking, the opportunity for public participation, and a delay in effective date, are inapplicable because this regulation involves a military or foreign affairs function of the United States. No other law requires that a notice of proposed rulemaking and an opportunity for public comment be given for this rule.

Therefore, this regulation is issued in final form. Although there is no formal comment period, public comments on this regulation are welcome on a continuing basis. Comments should be submitted to Nancy Crowe, Office of Technology and Policy Analysis, Bureau of Export Administration, Department of Commerce, room 4054, 14th Street and Pennsylvania Ave., NW., Washington, DC 20230.

PARTS 771, 773, 774, 776, 779, and 785—[AMENDED]

Accordingly, parts 771, 773, 774, 776, 779, and 785 of the Export Administration Regulations (15 CFR parts 730–799) are amended as follows:

1. The authority citation for 15 CFR parts 771 and 774 continues to read as follows:

Authority: Public Law 90–351, 82 Stat. 197 (18 U.S.C. 2510 *et seq.*), as amended; sec. 101, Public Law 93–153, 87 Stat. 576 (30 U.S.C. 185), as amended; sec. 103, Public Law 94–163, 89 Stat. 877 (42 U.S.C. 6212), as amended; secs. 201 and 201(11)(e), Public Law 94–258, 90 Stat. 309 (10 U.S.C. 7420 and 7430(e)), as amended; Public Law 95–223, 91 Stat. 1626 (50 U.S.C. 1701 *et seq.*); Public Law 95–242, 92 Stat. 120 (22 U.S.C. 3201 *et seq.* and 42 U.S.C. 2139a); sec. 208, Public Law 95–372, 92 Stat. 668 (43 U.S.C. 1354); Public Law 96–72, 93 Stat. 503 (50 U.S.C. App. 2401 *et seq.*), as amended; sec. 125, Public Law 99–64, 99 Stat. 156 (46 U.S.C. 466c); E.O. 11912 of April 13, 1976 (41 FR 15825, April 15, 1976); E.O. 12002 of July 7, 1977 (42 FR 35623, July 7, 1977), as amended; E.O. 12058 of May 11, 1978 (43 FR 20947, May 16, 1978); E.O. 12214 of May 2, 1980 (45 FR 29783, May 6, 1980); E.O. 12730 of September 30, 1990 (55 FR 40373, October 2, 1990), as continued by Notice of September 25, 1992 (57 FR 44649, September 28, 1992); and E.O. 12735 of November 16, 1990 (55 FR 48587, November 20, 1990), as continued by Notice of November 14, 1991 (56 FR 58171, November 15, 1991).

2. The authority citation for 15 CFR parts 773, 779 and 785 continues to read as follows:

Authority: Public Law 90–351, 82 Stat. 197 (18 U.S.C. 2510 *et seq.*), as amended; Public Law 95–223, 91 Stat. 1626 (50 U.S.C. 1701 *et seq.*); Public Law 95–242, 92 Stat. 120 (22 U.S.C. 3201 *et seq.* and 42 U.S.C. 2139a); Public Law 96–72, 93 Stat. 503 (50 U.S.C. App. 2401 *et seq.*), as amended; E.O. 12002 of July 7, 1977 (42 FR 35623, July 7, 1977), as amended; E.O. 12058 of May 11, 1978 (43 FR 20947, May 16, 1978); E.O. 12214 of May 2, 1980 (45 FR 29783, May 6, 1980); E.O. 12730 of September 30, 1990 (55 FR 40373, October 2, 1990), as continued by Notice of September 25, 1992 (57 FR 44649, September 2, 1992); and E.O. 12735 of November 16, 1990 (55 FR 48587, November 20, 1990), as continued by Notice of November 14, 1991 (56 FR 58171, November 15, 1991).

3. The authority citation for 15 CFR part 776 continues to read as follows:

Authority: Public Law 90–351, 82 Stat. 197 (18 U.S.C. 2510 *et seq.*), as amended; Public Law 95–223, 91 Stat. 1626 (50 U.S.C. 1701 *et seq.*); Public Law 95–242, 92 Stat. 120 (22 U.S.C. 3201 *et seq.* and 42 U.S.C. 2139a); Public Law 96–72, 93 Stat. 503 (50 U.S.C. App. 2401 *et seq.*), as amended; sec. 125, Public Law 99–64, 99 Stat. 156 (46 U.S.C. 466c); E.O. 12002 of July 7, 1977 (42 FR 35623, July 7, 1977), as amended; E.O. 12058 of May 11, 1978 (43 FR 20947, May 16, 1978); E.O. 12214 of May 2, 1980 (45 FR 29783, May 6, 1980); E.O. 12730 of September 30, 1990 (55 FR 40373, October 2, 1990), as continued by Notice of September 25, 1992 (57 FR 44649, September 28, 1992); and E.O. 12735 of November 16, 1990 (55 FR 48587, November 20, 1990), as continued by Notice of November 14, 1991 (56 FR 58171, November 15, 1991).

4. The term "Afghanistan" is removed from the following places:

Sec.
773.7(d)(2)(ii) heading and introductory text
773.7(d)(2)(ii)(A)
773.7(d)(2)(ii)(C)
773.7(h)(1)(ii)
773.7(i) heading and introductory text
773.7(i)(2)
773.7(i)(6)
773.7(k) introductory text
773.7(k) concluding text

5. The phrase "Afghanistan," is removed from the following places:

Sec.
771.23(b)
773.3(a)(1)(ii)
773.3(d)(3)(iii)(D)
776.8(b)(1)(ii)
776.8(b)(1)(iii)
776.10(a)(1)

6. The phrase "or Afghanistan" is removed from the following places:

Sec.
773.7(i)(1)
774.5(a)
779.4(f)(1)(i)
779.4(f)(1)(iii)
779.4(f)(2)(i)
779.4(f)(2)(iii)
779.5(e)(1)(vii)

7. The phrase "Afghanistan, Iran, and" is revised to read "Iran and" in the following places:

Sec.
773.7(d)(1) introductory text
773.7(d)(2)(i) [three references]
773.7(d)(2)(ii) introductory text
773.7(d)(3) introductory text [two references]
773.7(h)(1)(ii)

PART 773—[AMENDED]

8. Section 773.3 is amended by removing the phrase ", Afghanistan" from paragraph (e)(1)(ix)(I).

§ 773.7 [Amended]

9. Section 773.7 is amended:

a. By removing the phrase "Afghanistan and" from paragraph (c)(2) heading and text [two references];

b. By removing the phrase ", and Afghanistan" from paragraph (d)(1), introductory text;

c. By removing the phrase "and Afghanistan" from paragraph from footnote no. 2 to paragraph (h)(1)(i); and

d. By removing the phrase ", or to Afghanistan" from paragraph (i)(4).

§ 773.8 [Amended]

10. Section 773.8 is amended by removing the phrase "or Afghanistan," from paragraph (a)(2), introductory text.

§ 773.8 [Amended]

11. Section 773.8 is amended by removing the phrase ", Afghanistan" from paragraph (c)(1).

PART 779—[AMENDED]

12. Section 779.5 is amended:

a. By revising the phrase "the People's Republic of China, or Afghanistan" in paragraph (e)(2) the first place it appears to read "or the People's Republic of China"; and

b. By removing the phrase ", or Afghanistan" from the end of the first sentence in paragraph (e)(2).

PART 785—[AMENDED]

13. Section 785.4 is amended:

a. By removing paragraph (f); and

b. By redesignating paragraph (g) as paragraph (f).

Dated: December 31, 1992.

James M. LeMunyon,

Acting Assistant Secretary for Export Administration.

[FR Doc. 93–161 Filed 1–5–93; 8:45 am]

BILLING CODE 3510–DT–M

15 CFR Parts 771 and 777

[Docket No. 910480–2266]

Western Red Cedar

AGENCY: Bureau of Export Administration, Commerce.

ACTION: Final rule.

SUMMARY: The Bureau of Export Administration (BXA) is amending the Export Administration Regulations (EAR) by adding a new General License GLOG, which authorizes exports of unprocessed western red cedar, and by revising the short supply provisions of the EAR to remove the individual validated licensing requirements for exports of unprocessed western red cedar harvested from: Federal, State, and other public lands in Alaska, lands held in trust by any Federal or State official or agency for a recognized Indian tribe, or private lands. In addition, this rule amends the short supply provisions of the EAR by revising the licensing procedures and recordkeeping requirements for exports of unprocessed western red cedar.

Unprocessed western red cedar harvested from Federal or State lands (except lands in the State of Alaska and lands held in trust for recognized Indian tribes by Federal or State agencies) continues to require a validated license. Applications to export unprocessed western red cedar harvested from these public lands will be reviewed with a presumption of denial.

This rule also revises the definition of processed western red cedar to exclude any individual piece of western red cedar having a cross section that exceeds 2,000 square centimeters (310 square inches), regardless of grade.

BXA expects the new General License GLOG to eliminate individual validated licensing for approximately $78 million of annual exports.

EFFECTIVE DATE: This rule is effective January 6, 1993.

FOR FURTHER INFORMATION CONTACT: Bernard Kritzer, Office of Foreign Availability (OFA), Bureau of Export Administration, Telephone: (202) 482–0074.

SUPPLEMENTARY INFORMATION:

Background

The Department of Commerce administers export controls, under section 7(i) of the Export Administration Act[1] (EAA), as amended, on western red cedar. Section 777.7 of the Export Administration Regulations (EAR) formerly required an individual validated license to export all unprocessed western red cedar (WRC) timber, with a presumption of denial for WRC timber harvested from public lands located outside the state of Alaska. This final rule amends the EAR:

(1) By revising § 777.7 to remove the individual validated licensing requirements for exports of unprocessed western red cedar harvested from private lands, Indian lands, or Federal, State, and other public lands in Alaska;

(2) By adding § 771.7, which authorizes exports of this unprocessed western red cedar under a new General License GLOG; and

(3) By revising, in § 777.7, certain licensing procedures and recordkeeping requirements for exports of unprocessed red cedar.

These changes are consistent with those contained in the proposed rule on western red cedar that BXA published in the **Federal Register** on June 3, 1991 (56 FR 25054).

Exports of unprocessed western red cedar harvested from Federal and State lands (except lands in the State of Alaska and lands held in trust for recognized Indian tribes by Federal or State agencies) continue to require a validated license. A presumption of denial exists for such timber if it was harvested under harvest contracts entered into after September 30, 1979.

This rule also revises the definition of processed western red cedar. Previously, the licensing requirements of § 777.7 did not apply to WRC timber that had been processed into lumber of American Lumber Standards, Grades of Number 3 or better, or Pacific Lumber Inspection Bureau of Export R-List Grades of Number 3 dimension common or better. This rule revises the definition of processed western red cedar in § 777.7 to limit the maximum cross section for any individual piece of western red cedar that may be exported as processed lumber to 2,000 square centimeters (310 square inches), regardless of grade.

This clarification conforms with the comments submitted by the U.S. Department of Agriculture's Forest Service Pacific Northwest Region (Forest Service) on the June 3, 1991, proposed rule. The Forest Service comments, which were the only comments received on the proposed rule, supported the establishment of a limit, based on product size (2,000 square centimeter or 310 square inch cross section), to distinguish between processed and unprocessed western red cedar, but indicated that the proposed rule was unclear as to whether the 310 square-inch cross section limitation applied to "Number 3 Common or Better" lumber as a single grade, or "Number 3 Common" and all higher (or better) grades of lumber. The Forest Service suggested that the size limitation apply to any piece of timber, regardless of grade. BXA agrees with this interpretation and believes that it is consistent with the intent of the statute to restrict the maximum size, with or without wane, that can be considered to be processed western red cedar lumber and, therefor, not subject to the licensing requirements described in § 777.7.

Rulemaking Requirements

1. This rule is consistent with Executive Orders 12291 and 12661.

2. This rule involves a collection of information subject to the requirements of the Paperwork Reduction Act of 1980 (44 U.S.C. 3501 *et seq.*). This collection has been approved by the Office of Management and Budget under control number 0694–0005. This rule also contains a collection of information that has been approved by OMB under control number 0694–0025 and new recordkeeping requirements for

[1] Although the Export Administration Act of 1979 (EAA), as amended, expired on September 30, 1990, the President invoked the International Emergency Economic Powers Act and continued in effect, to the extent permitted by law, the provisions of the EAA and the Export Administration Regulations in Executive Order 12730 of September 30, 1990.

exporters using the General License GLOG that have been approved by OMB under control number 0694–0065. Public burden hours for these information collection and recordkeeping requirements is estimated to average 30 minutes for the collection of information under 0694–0025 and 1 hour for the new recordkeeping requirement 0694–0065. This includes the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding these burden estimates or any other aspect of the data requirements, including suggestions for reducing these burdens, to the Office of Security and Management Support, Bureau of Export Administration, U.S. Department of Commerce, Washington, DC 20230; and to the Office of Information and Regulatory Affairs, Office of Management and Budget, Washington, DC 20503 (ATTN: Paperwork Reduction Project—0694–0025 and/or 0694–0065).

3. This rule does not contain policies with Federalism implications sufficient to warrant preparation of a Federalism assessment under Executive Order 12612.

4. The General Counsel of the Department of Commerce has certified to the Chief Counsel for Advocacy of the Small Business Administration that this rule will not have a significant economic impact on a substantial number of small entities. The establishment of General License GLOG is expected to result in the export licensing decontrol of approximately $75 million to $80 million (extrapolated from 1989 data) of unprocessed western red cedar harvested from private lands and Indian lands, as well as Federal, State, and other public lands in Alaska. This amount represents approximately one to one and one-half percent of the $6 billion dollar value of United States exports of forest products during 1990. As a result, no initial or final Regulatory Flexibility Analysis has to be or will be prepared.

5. The provisions of the Administrative Procedure Act, 5 U.S.C. 553, requiring notice of proposed rulemaking and the opportunity for public participation have been satisfied because this rule was issued in proposed form and comments were considered in the development of this final rule. Moreover, because this rule relieves certain licensing burdens on exporters, there is good cause for making it effective immediately.

Although there is no formal comment period, public comments on this regulation are welcome on a continuing basis. Comments should be submitted to Willard Fisher, Office of Technology and Policy Analysis, Bureau of Export Administration, Department of Commerce, P.O. Box 273, Washington, DC 20044.

List of Subjects

15 CFR Part 771

Exports, Reporting and recordkeeping requirements.

15 CFR Part 777

Administrative practice and procedure, Exports, Forest and forest products, Petroleum, Reporting and recordkeeping requirements.

Accordingly, parts 771 and 777 of the Export Administration Regulations (15 CFR parts 730–799) are amended as follows:

1. The authority citation for 15 CFR part 771 is revised to read as follows:

Authority: Pub. L. 90–351, 82 Stat. 197 (18 U.S.C. 2510 *et seq.*), as amended; sec. 101, Pub. L. 93–153, 87 Stat. 576 (30 U.S.C. 185), as amended; sec. 103, Pub. L. 94–163, 89 Stat. 877 (42 U.S.C. 6212), as amended; secs. 201 and 201(11)(e), Pub. L. 94–258, 90 Stat. 309 (10 U.S.C. 7420 and 7430(e)), as amended; Pub. L. 95–223, 91 Stat. 1626 (50 U.S.C. 1701 *et seq.*); Pub. L. 95–242, 92 Stat. 120 (22 U.S.C. 3201 *et seq.* and 42 U.S.C. 2139a); sec. 208, Pub. L. 95–372, 92 Stat. 668 (43 U.S.C. 1354); Pub. L. 96–72, 93 Stat. 503 (50 U.S.C. App. 2401 *et seq.*), as amended; sec. 125, Pub. L. 99–64, 99 Stat. 156 (46 U.S.C. 466c); E.O. 11912 of April 13, 1976 (41 FR 15825, April 15, 1976); E.O. 12002 of July 7, 1977 (42 FR 35623, July 7, 1977), as amended; E.O. 12058 of May 11, 1978 (43 FR 20947, May 16, 1978; E.O. 12214 of May 2, 1980 (45 FR 29783, May 6, 1980); E.O. 12730 of September 30, 1990 (55 FR 40373, October 2, 1990), as continued by Notice of September 25, 1992 (57 FR 44649, September 28, 1992); and E.O. 12735 of November 16, 1990 (55 FR 48587, November 20, 1990), as continued by Notice of November 14, 1991 (56 FR 58171, November 15, 1991).

2. The authority citation for 15 CFR part 777 is revised to read as follows:

Authority: Pub. 90–351, 82 Stat. 197 (18 U.S.C. 2510 *et seq.*), as amended; sec. 101, Pub. L. 93–153, 87 Stat. 576 (30 U.S.C. 185), as amended; sec. 103, Pub. L. 94–163, 89 Stat. 877 (42 U.S.C. 6212), as amended; secs. 201 and 201(11)(e), Pub. L. 94–258, 90 Stat. 309 (10 U.S.C. 7420 and 7430(e)), as amended; Pub. L. 95–223, 91 Stat. 1626 (50 U.S.C. 1701 *et seq.*); Pub. L. 95–242, 92 Stat. 120 (22 U.S.C. 3201 *et seq.* and 42 U.S.C. 2139a); sec. 208, Pub. L. 95–372, 92 Stat. 668 (43 U.S.C. 1354); Pub. L. 96–72, 93 Stat. 503 (50 U.S.C. App. 2401 *et seq.*), as amended; E.O. 11912 of April 13, 1976 (41 FR 15825, April 15, 1976); E.O. 12002 of July 7, 1977 (42 FR 35623, July 7, 1977), as amended; E.O. 12058 of May 11, 1978 (43 FR 20947, May 16, 1978); E.O. 12214 of May 2, 1980 (45 FR 29783, May 6, 1980); E.O. 12730 of September 30, 1990 (55 FR 40373, October 2, 1990), as continued by Notice of September 25, 1992 (57 FR 44649, September 28, 1992); and E.O. 12735 of November 16, 1990 (55 FR 48587, November 20, 1990), as continued by Notice of November 14, 1991 (56 FR 58171, November 15, 1991).

PART 771—[AMENDED]

3. Section 771.7 (formerly reserved) is added to read as follows:

§ 771.7 General License GLOG; Unprocessed western red cedar timber harvested from public lands in Alaska, private lands, and Indian lands.

(a) *Scope.* A General License GLOG is established, subject to the provisions of this section (including the recordkeeping requirements described in paragraph (b)), authorizing the export of unprocessed western red cedar timber harvested from Federal, State and other public lands in Alaska, all private lands, and lands held in trust for recognized Indian tribes by Federal or State agencies.

(b) *Recordkeeping requirements.* Exporters who use General License GLOG must obtain and retain on file the documents described in paragraphs (b)(1) and (b)(2) of this section. These documents must be maintained in accordance with the recordkeeping requirements of § 787.13 of this subchapter.

(1) A statement by the exporter (or other appropriate documentation) indicating that the unprocessed western red cedar timber exported under GLOG was not harvested from State or Federal lands outside the State of Alaska, and did not become available for export through substitution of commodities so harvested or produced. If the exporter did not harvest or produce the timber, the records or statement must identify the harvester or producer and must be accompanied by an identical statement from the harvester or producer. If any intermediate party or parties held title to the timber between harvesting and purchase, the exporter must also obtain such a statement, or equivalent documentation, from the intermediate party or parties and retain it on file. The exporter shall retain this documentation in the files for the period prescribed in § 787.13(e).

(2) A certificate of inspection issued by a third party log scaling and grading organization, approved by the United States Forest Service, that:

(i) Specifies the quantity in cubic meters or board feet, scribner rule, of unprocessed western red cedar timber to be exported; and

(ii) Lists each type of brand, tag, and/or paint marking that appears on any log

or unprocessed lumber in the export shipment or, alternatively, on the logs from which the unprocessed timber was produced.

Note: See § 777.7 for the definition of unprocessed red cedar.

PART 777—[AMENDED]

4. Section 777.7 is revised to read as follows:

§ 777.7 Unprocessed western red cedar.

(a) *General.* The export of unprocessed western red cedar timber, as defined in paragraph (b) of this section, from the United States to any destination, including Canada, is prohibited, except pursuant to a validated license issued by the Office of Export Licensing, unless the timber was harvested from public lands in the State of Alaska, private lands, or Indian lands, and otherwise meets the requirements for export under General License GLOG (see § 771.7 of this subchapter).

(b) *Licensing policy.* (1) The Office of Export Licensing will generally deny applications for individual validated licenses to export unprocessed western red cedar harvested from Federal or State lands under harvest contracts entered into after September 30, 1979.

(2) The Office of Export Licensing will consider, on a case-by-case basis, applications for individual validated licenses to export unprocessed western red cedar harvested from Federal or State lands under harvest contracts entered into prior to October 1, 1979.

(c) *Definitions.* When used in this section, the following terms have the meaning indicated:

(1) *Unprocessed western red cedar* means western red cedar (thuja plicata) timber, logs, cants, flitches, and processed lumber containing wane on one or more sides, as defined in ECCN 1C88D, that has not been processed into:

(i) Lumber of American Lumber Standards Grades of Number 3 dimension or better, or Pacific Lumber Inspection Bureau Export R-List Grades of Number 3 common or better grades, with a maximum cross section of 2,000 square centimeters (310 square inches) for any individual piece of processed western red cedar (WRC) being exported, regardless of grade;

(ii) Chips, pulp, and pulp products;

(iii) Veneer and plywood;

(iv) Poles, posts, or pilings cut or treated with preservative for use as such and not intended to be further processed; and

(v) Shakes and shingles.

(2) *Federal and State lands* means Federal and State lands, excluding lands in the State of Alaska and lands held in trust by any Federal or State official or agency for a recognized Indian tribe or for any member of such tribe.

(3) *Contract harvester* means any person who, on October 1, 1979, had an outstanding contractual commitment to harvest western red cedar timber from State and Federal lands and who can show by previous business practice or other means that the contractual commitment was made with the intent of exporting or selling for export in unprocessed form all or part of the commodities to be harvested.

(4) *Producer* means any person engaged in a process that transforms an unprocessed western red cedar commodity (e.g., western red cedar timber) into another unprocessed western red cedar commodity (e.g., cants) primarily through a saw mill.

(d) *Application for export license.* (1) Applicants to export unprocessed western red cedar must submit a properly completed Form BXA-622P, Application for Export License, other documents as may be required by the Office of Export Licensing, and a signed statement from an authorized representative of the exporter, reading as follows:

I, _____
(Name)

_____
(Title)

of _____
(Exporter)

Hereby Certify that to the best of my knowledge and belief the

_____
(Quantity)

(cubic meters or board feet scribner) of unprocessed western red cedar timber that

_____
(Exporter)

proposes to export was not harvested from State or Federal lands under contracts entered into after October 1, 1979.

_____
(Signature)

_____
(Date)

(2) For Items 6 and 7 on Form BXA–622P, "Various" may be entered when there is more that one purchaser or ultimate consignee.

(e) *Supporting documentation.* For each Form BXA–622P submitted, and for each export shipment made under the authority of a validated export license, the exporter must assemble and retain for the period prescribed in § 787.13(e) of this subchapter, and produce or make available for inspection as provided in § 787.13(f), the following:

(1) A signed statement(s) by the harvester or producer, and each subsequent party having held title to the commodities, that the commodities in question were harvested under a contract to harvest unprocessed western red cedar from State or Federal lands, entered into before October 1, 1979; and

(2) A copy of the Shipper's Export Declaration.

(f) *Shipping tolerance.* A shipping tolerance of 5 percent in cubic feet or board feet scribner is allowed on the unshipped balance of a commodity listed on an individual validated license. This tolerance applies only to the final quantity remaining unshipped on a license against which more than one shipment is made and not to the original quantity authorized by such license. (See § 786.7 of this subchapter.)

(g) *Communications.* Questions concerning applications to export unprocessed western red cedar under this section, and the specific documentation requirements, should be directed to the Bureau of Export Administration at the address provided in § 772.1(e) of this subchapter.

Dated: December 30, 1992.

James M. DeMunyon,

Acting Assistant Secretary for Export Administration.

[FR Doc. 93–231 Filed 1–5–93; 8:45 am]

BILLING CODE 3510–DT–M

DEPARTMENT OF ENERGY

Federal Energy Regulatory Commission

18 CFR Part 2

[Docket No. FA88–62–001]

Order Denying Interlocutory Appeal and Amending Policy Statement Concerning Disclosure of Documents and Information Obtained in Staff Audits

Issued December 28, 1992.

AGENCY: Federal Energy Regulatory Commission, DOE.

ACTION: Final rule; policy statement.

SUMMARY: The Federal Energy Regulatory Commission (Commission) is amending its regulations which authorized disclosure of information in cases under the Natural Gas Act scheduled for formal hearing if the information is relevant to the case. The Commission is extending the provisions of those regulations to Commission

proceedings under the Federal Power Act and under the Interstate Commerce Act as it applies to the regulation of oil pipelines. The Commission found that the authorization of the release of information specified in a prior policy statement for natural gas proceedings and the underlying rationale are equally applicable in other Commission proceedings.

EFFECTIVE DATE: This final rule is effective December 28, 1992.

FOR FURTHER INFORMATION CONTACT: Kasha Ciaglo, Office of General Counsel, Federal Energy Regulatory Commission, 825 North Capitol St., NE., Washington, DC 20426, Telephone: (202) 208–2165.

SUPPLEMENTARY INFORMATION: In addition to publishing the full text of this document in the Federal Register, the Commission also provides all interested persons an opportunity to inspect or copy the contents of this document during normal business hours in the Commission's Public Reference Room, room 3104, 941 North Capitol St., NE., Washington, DC 20426.

The Commission Issuance Posting System (CIPS), an electronic bulletin board service, provides access to the texts of formal documents issued by the Commission. CIPS is available at no charge to the user and may be accessed using a personal computer with a modem by dialing (202) 208–1397. To access CIPS, set your communications software to use 300, 1200 or 2400 baud, full duplex, no parity, 8 date bits, and 1 stop bit. The full text of this final rule will be available on CIPS for 30 days from the date of issuance. The complete text on diskette in WordPerfect format may also be purchased from the Commission's copy contractor, LaDorn Systems Corporation, also located in room 3104, 941 North Capitol St., NE., Washington, DC 20426.

I. Background

On November 16, 1992, Wisconsin Electric Power Company (Company) filed an interlocutory appeal of the presiding judge's denial of a motion to permit appeal rendered on November 9, 1992. On November 23, 1992, the Chairman, as the Motions Commissioner, determined, pursuant to Rule 715 of the Commission's Rules of Practice and Procedure, 18 CFR 385.715, that extraordinary circumstances existed which made prompt Commission review of the contested rulings necessary to prevent detriment to the public interest or irreparable harm to any person, warranting referral to the Commission of the Company's interlocutory appeal.

A. The Case

On February 4, 1992, the Chief Accountant issued an audit report under delegated authority summarizing the results of an audit performed by the Office of Chief Accountant's Division of Audits. Wisconsin Electric Power Company, 58 FERC ¶ 62,121 (1992). The Chief Accountant noted the Company's disagreement with one item included in the report, regarding the accounting and fuel adjustment clause billings for coal mine reclamation costs. 58 FERC at 63,350, 63,357–60. In response to a request from the Chief Accountant regarding disposition of the question, the Company initially advised the Commission that it consented to the shortened procedures provided under section 41.3 of the Commission's regulations. 18 CFR 41.3. Accordingly, on March 30, 1992, the Commission issued an Order Instituting Proceedings under part 41 of the Commission's Regulations. Wisconsin Electric Power Company, 58 FERC ¶ 61,332 (1992). On April 22, 1992, the Company filed a motion for termination of the shortened procedures under part 41 and for a hearing under part 385. Accordingly, on May 14, 1992, the Commission set the accounting issue for evidentiary hearing. Wisconsin Electric Power Company, 59 FERC ¶ 61,184 (1992). On August 19, 1992, the Commission issued an order expanding the scope of the hearing to include prudence issues. Wisconsin Electric Power Company, 60 FERC ¶ 61,181 (1992).

1. The Legal Opinions at Issue

In October 1990, at the request of audit staff, the Company provided a copy of four opinions rendered by its in-house and outside legal counsel concerning the coal mine reclamation costs dispute. In a letter to the audit staff dated October 25, 1990, the Company asserted that the opinions involved factual and legal analysis by its attorneys and so constituted privileged working papers and attorney-client communications. Nonetheless, "in order to resolve the issue," the Company provided the opinions to audit staff, "on the condition that the opinions be kept confidential, not reproduced, and returned to the Company when [the] audit is closed." The Company requested privileged and confidential treatment of the documents under 18 CFR 388.112.[1]

When trial staff advised the Company that it proposed to use the documents in evidence and under seal, the Company asserted that trial staff had no right to use the documents.[2]

2. The Presiding Judge's Orders

On September 29, 1992, trial staff filed a motion requesting a conference to resolve the status of the four opinions. Trial staff argued that the Company's voluntary disclosure of the documents to the audit staff waived any attorney-client or work product privilege that might apply to the documents. On October 9, 1992, the Company filed an answer opposing trial staff's request to use the privileged documents, arguing that the Company waived neither the attorney-client nor work product privilege and that the documents should not be used in the trial staff's prudence evidence.

At a prehearing conference on October 15, 1992, the presiding judge granted the relief requested in the trial staff's motion. The judge adopted what he called the "majority view" that, once the documents were voluntarily disclosed, the privilege is waived, even if the third-party agrees not to disclose the information to anyone else. The judge cited as support cases from the District of Columbia and Third Circuits: *Permian Corporation* v. *United States*, 665 F.2d 1214 (D.C. Cir. 1981) (Permian) and *Westinghouse Electric Corporation* v. *Republic of the Philippines*, 951 F.2d 1414 (3d Cir. 1991) (*Westinghouse*). Tr. 20, 21. The judge considered the rejected the Eighth Circuit's limited waiver analysis relied upon by the Company: *Diversified Industries, Inc.* v. *Meredith*, 572 F.2d 596 (8th Cir. 1977) (Diversified). Tr. 21.[3]

The judge declined to follow Diversified for two reasons. First, in the case at bar, there was no agreement on the part of trial staff to keep the information confidential. The Company merely requested confidential treatment pursuant to section 388.112, which does not insure a document's confidentiality. Tr. 21. The judge added that, although section 388.112 provides that the Commission will place materials it receives under a request for privileged

[1] Section 388.112 provides that a party submitting a document to the Commission may request privileged treatment by claiming that all or part of the information is exempt from Freedom of Information Act (FOIA) requirements and should be withheld from public disclosure.

[2] The Company also objected to an intervenor's discovery requests seeking the legal opinions.

[3] In Diversified, the company voluntarily surrendered privileged material to the Securities and Exchange Commission (SEC). The court concluded that only a limited waiver of the attorney-client privilege had occurred, reasoning that to hold otherwise may have the effect of thwarting the developing procedure of corporations to employ independent outside counsel to investigate and advise them in order to protect stockholders, potential stockholders and customers. Diversified, 572 F.2d at 611.

treatment in a non-public file, it also provides that this is not a determination on any claim or privilege and that the "Commission retains the right to make determinations with regard to any claim or privilege, and the discretion to release information as necessary to carry out its jurisdictional responsibilities." *Id.*, discussing and quoting 18 CFR 388.112.

Second, the judge followed the Permian and Westinghouse line of cases which specifically reject Diversified's "limited" or "selective" waiver theory. Tr. 22. The judge noted that, the Permian court rejected Diversified's selective waiver because it has little to do with the purpose of the attorney-client privilege, and because voluntary cooperation with government investigations does not improve the attorney-client relationship. Permian, 665 F. 2d at 1220–21. Tr. 22. The judge found that, once the attorney-client privilege is waived, it is waived for all purposes. As a Permian, the Company may not pick and choose as to the issues to which the privilege still attaches. *Id.*

The presiding judge also rejected the Company's argument that section 301(b) of the Federal Power Act (FPA), 16 U.S.C. § 825(b) (1988), prohibits release of the documents. The judge explained that section 301(b) provides that information received by staff in the course of an audit shall be kept confidential unless ordered to be disclosed by a Commission or court order. Tr. 22–23. The judge reasoned that the Commission's two hearing orders in this case are sufficient to satisfy the requirements of section 301(b) and to authorize the use of the documents received by audit staff in this investigation. Tr. 22–24, 26. The judge relied on the Federal Power Commission decision in Availability of Information Acquired By Staff Investigation, Order No. 509–A, 52 FPC 389 (1974), involving a statement of policy that the Commission was not going to assume a case-by-case determination of when information garnered by staff in various investigations should be released, but was authorizing as a matter of policy that the information can be released and not kept confidential. The judge noted that, while this statement of policy was issued under the National Gas Act, in adopting this statement of policy the Commission has relied on the legislative history of section 301(b) of the Federal Power Act. Tr. 23–24.

The judge added that he was willing to proceed with use of the information pursuant to a protective order, but would retain his right to re-examine the question of whether the information should be protected once he had viewed the documents. TR 24–25.

On October 30, 1992, the Company filed a motion to permit an interlocutory appeal to the Commission, from the presiding judge's rulings, under 18 CFR 385.715. On November 5, 1992 trial staff filed an answer opposing the Company's motion. On November 9, 1992, the presiding judge issued an order which denied the Company's motion. The judge stated that, based on the applicable case law and the rationale in his October 15, 1992 ruling, the Company had not demonstrated the extraordinary circumstances which would warrant prompt Commission review.

B. The Company's Interlocutory Appeal

In its November 16, 1992 interlocutory appeal, the Company objected to the judge's interlocutory rulings that: (1) The Company has waived the attorney-client and work product privileges attached to legal opinions by providing them to audit staff under an express claim of privilege and on the condition that they be given confidential treatment; and (2) the Commission's hearing orders implicitly authorize the release of the opinions under section 301(b) of the FPA, which prohibits a Commission employee from divulging information required in an audit except as directed by the Commission or a court. The Company claims that the first ruling would discourage utilities from providing privileged documents to the audit staff in audits. According to the Company, the second ruling would violate the prohibition against disclosure; the documents cannot be released absent a Commission order without violating section 301(b).

With respect to the claim of privilege, the Company argues that there is well-reasoned precedent for a "limited waiver" theory under which disclosure of privileged documents to an agency for one purpose does not result in a waiver for other purposes, citing Diversified. The Company claims that Diversified applies here because legal opinions were disclosed to audit staff in a confidential audit and the presiding judge ruled that the confidential disclosure entitled trial staff and an intervenor access to documents on the separate prudence issue. The Company argues that requiring such disclosure here would thwart full disclosure in audits. The Company also argues that the "unlimited waiver" theory adopted by the D.C. Circuit was adopted without intending to deprive an agency of the power to adopt a "limited waiver" approach, citing In Re Sealed Case, 676 F.2d 793 (D.C. Cir. 1982). The Company believes that the Commission is free to adopt a "limited waiver" policy as best serving full disclosure in audits.

With regard to the claim that section 301(b) protects the confidentiality of information obtained by the audit staff, the Company criticizes the judge's finding that the hearing orders in this proceeding may be construed as lifting the requirement that the documents be kept confidential. The Company notes that the judge's finding was based on Order No. 509–A, which is a statement of policy under the Natural Gas Act. The Company contends that there is no comparable statement of policy under the FPA. In addition, the Company argues that Order No. 509–A did not provide that hearing orders implicitly authorize the release of documents. Consequently, the necessary legal authorization for release of the documents at issue here is missing.

II. Discussion

There are essentially two issues to be resolved in this proceeding: First, whether the Company waived the attorney-client and work product privileges for all purposes when it voluntarily disclosed certain documents to the audit staff; and second, whether the Commission's hearing orders authorized the release of the documents under section 301(b) of the FPA.

A. Waiver of Attorney-Client and Work Product Privileges

As an initial matter, the Commission notes that the Company requests privileged treatment of the documents under section 388.112 of the Commission's regulations, but argues that the staff would violate attorney-client and work product privileges by releasing these documents. Section 388.112 has nothing to do with attorney-client communications or work product Rather, it provides procedures under which a party may request that a document be exempt from FOIA requirements and be withheld from public disclosure. As noted above, and discussed further *infra*, the presiding judge agreed to use the documents under a protective order, which would be consistent with section 388.112. However, that provision also allows protected information to be released, subject to certain notice and comment procedures.

In addition, staff has, to this point, kept the documents confidential. Tr. 26–30. Trial staff has proposed a procedure that would ensure that the documents would be provided to the decisionmaker and at the same time would protect any rights that the

Company may have under FOIA. Trial staff would offer the documents in evidence in this proceeding by filing a sealed copy of trial staff's testimony with the presiding judge and placing only a redacted copy in the public files. Other parties to the case would be granted access to the sealed portion of staff's testimony if they executed a protective agreement preventing public disclosure. The Commission finds this proposal reasonable and in compliance with the Company's request for privileged treatment under § 388.112. We will leave to the presiding judge's sound discretion whether the documents should later be released or made public, pursuant to the requirements in § 388.112.

The Commission believes that the Company's appeal raises various issues regarding the Commission's policy regarding attorney-client communications and work product that should be addressed and clarified.

As noted above, there are two schools of thought regarding voluntary disclosure and subsequent waiver. One school, following Diversified, recognizes the "limited" or "selective" waiver theory under which disclosure of privileged documents for one purpose does not result in waiver for other purposes. The other school, following Permian and Westinghouse, recognizes the "unlimited" waiver theory that, once the attorney-client or work product privilege is voluntarily waived for any purpose, it is waived for all purposes. The Commission believes that the presiding judge ruled correctly in following the "unlimited" waiver theory in this proceeding and rejecting the "selective" waiver theory. In this regard, the Commission specifically adopts the presiding judge's rationale from the October 15, 1992 prehearing conference, discussed above, in support of the unlimited waiver theory.

The Commission believes that the better approach is to reject creating a special exception to the waiver doctrine for the purpose of encouraging voluntary disclosure to government agencies. Westinghouse, 951 F.2d at 1424.[4] The Commission disagrees that adopting the theory of unlimited waiver will discourage utilities from providing the audit staff with confidential information. The unlimited waiver rule does not affect a utility's right to protect legitimate attorney-client communications and work product. The utility may still assert the privileges, even in audits. However, once the utility has opted to surrender the privileges because the utility believes it to be in its interest to do so, the utility cannot reassert the privileges at a later date when it believes it better to conceal what it earlier revealed. Additionally, we have not seen natural gas companies refuse to provide confidential data to staff as a result of the statement of policy announced in Order No. 509–A, making information acquired by staff investigation available in contested cases.

The Commission also believes that the Company's voluntary disclosure waived the work product privilege that may apply to these documents. In contrast to the attorney-client privilege, the work product privilege exists not to protect a confidential relationship, but rather to promote the adversary system by safeguarding the fruits of an attorney's trial preparation from the discovery attempts of an opponent. Permian, 665 F.2d at 1219, *citing United States* v. *AT&T*, 642 F.2d 1285, 1299 (D.C. Cir. 1980). Hence, the work product privilege is not automatically waived by any disclosure to a third party. *Id.*[5]

The D.C. Circuit has identified three factors that lead to a waiver of work product privilege:[6] (1) "the party claiming the privilege seeks to use it in a way that is not consistent with the purpose of the privilege," citing In Re Sealed Case, 676 F.2d at 818; (2) the party had no reasonable basis for believing that the disclosed materials would be kept confidential by the agency; and (3) waiver of the privilege would not trench on any policy inherent in the privilege. In Re Subpoena Duces Tecum, 738 F.2d at 1372.

Concerning the first factor, the court reasoned that fairness and consistency require that the party not be allowed to gain substantial advantages resulting from voluntary disclosure of work product to one adversary—in that case, SEC—while being able to maintain another advantage in protecting the same work product from other adversaries. In Re Subpoena Duces Tecum, 738 F.2d at 1372, citing In Re Sealed Case, 676 F.2d at 818–21. The court added that, in that instance, it was unreasonable not to anticipate litigation with other adversaries at the time of disclosure to the SEC. *Id.* Here, the Company disclosed the documents to gain advantage with the audit staff and then asserted work product privilege for those documents in a later trial-type evidentiary hearing that resulted from that investigation. The Company cannot be allowed to disclose the documents selectively within the Commission.

With regard to the second factor, concerning confidentiality, the court found no common interest between the company and the regulatory agency in that case, and declined to find in the SEC's procedures any proper expectations of confidentiality that the company claimed. In Re Subpoena Duces Tecum, 738 F.2d at 1372–74. Similarly, the Company's request for confidentiality under FOIA and the Commission's FOIA regulations, given the circumstances of its disclosure, does not justify the expectation of confidentiality that the D.C. Circuit found necessary to maintain the privilege. The Company could have no reasonable expectations that its disclosure in an attempt to influence the audit staff could be limited so as to preclude disclosure to the parties, trial staff and presiding judge (and ultimately the Commission) later in the same case.[7]

With regard to the third factor, as to policy concerns, the court believed there was no policy inherent in the work product privilege that required a special exception for the SEC's voluntary disclosure program or similar governmental projects. The court stated that the privilege does not protect against the manipulation of selecting a particular opponent for selective disclosure, most probably for the discloser's own benefit. In Re Subpoena Duces Tecum, 738 F.2d at 1374–75. Here also there is no policy inherent in the work product privilege which calls for a special waiver exemption. The Company "voluntarily and deliberately made disclosures to" the Commission "undoubtedly in the hope and expectation of receiving a benefit * * *." *Id.* at 1375. While such disclosure is certainly not improper, it is inconsistent with a later assertion of a work product privilege.

[4] The Company's request that the documents be kept confidential under section 388.112 of the Commission's regulations does not reinstate the Company's waived privilege. Westinghouse, 951 F.2d at 1427. In Westinghouse, the Department of Justice (DOJ) had apparently agreed not to disclose the information and SEC regulations provided that the SEC would maintain confidentiality. *Id.* Nonetheless, the court found that voluntary disclosures to the SEC and the DOJ still waived the attorney-client privilege. *Id.*

[5] See also In Re Sealed Case, 676 F.2d at 809; In Re Subpoena Duces Tecum, 738 F.2d 1367, 1371 (D.C. Cir. 1984); and Westinghouse, 951 F.2d at 1428.

[6] In Westinghouse, the court stated: "Most courts hold that to waive the protection of the work-product doctrine, the disclosure must enable an *adversary* to gain access to the information [and] the purpose of the work-product doctrine requires [the court] to distinguish between disclosure to adversaries and disclosures to non-adversaries." Westinghouse, 951 F.2d at 1428 (emphasis added). When, as is the case here, the company is the target of an investigation conducted by the agency, the courts have found that the agency is the company's adversary. *Id.* *Subpoena* Duces Tecum, 738 F.2d at 1372.

[7] *Cf. infra* note 12.

The Company would also fail the Third Circuit's test in Westinghouse. Under the Third Circuit's standard, a party who discloses documents protected by the work product doctrine may continue to assert the doctrine's protection only when the disclosure furthers the doctrine's underlying goal. Westinghouse, 951 F.2d at 1429. According to the court:

> When a party discloses protected materials to a government agency investigating allegations against it, it uses those materials to forestall prosecution (if the charges are unfounded) or to obtain lenient treatment (in the case of well-founded allegations). These objectives, however rational, are foreign to the objectives underlying the work-product doctrine.

Id. Like Westinghouse, the Company disclosed the documents to the Commission's audit staff "to resolve the issue." Again, this objective is certainly not improper, but it is inconsistent with the objectives underlying the work product privilege.[8]

In summary, the Commission believes that the Company waived both the attorney-client and the work product privileges in this proceeding. The Company provided the documents in this case "in order to resolve the issue." However, the evidentiary hearing that the Commission ordered is likewise for the precise purpose of resolving the issue. The question here is whether, having provided the documents to audit staff early in the proceeding to help resolve the issue, the Company may later in the proceeding assert a privilege with regard to those documents. The answer is no.[9]

We also note that our position regarding disclosures of privileged materials here is consistent with our prior rulings: a disclosure of privileged material waives the privileges as to that material; once it is disclosed, the confidentiality is breached.[10]

B. Release of Documents Under Section 301(b) of the FPA

The second issue in this proceeding pertains to whether the two hearing orders issued by the Commission—one to initiate the audit investigation and the other to initiate the prudence inquiry—authority staff's release of the documents pursuant to section 301(b) of the FPA.

Under section 301(b),

> No member, officer, or employee of the Commission shall divulge any fact or information which may come to his knowledge during the course of examination of books or other accounts, as hereinbefore provided, except insofar as he may be directed by the Commission or by a court.

The Company argues that this provision protects the confidentiality of *any* information which the audit staff uncovers, unless the Commission or a court requires that it be divulged. As noted above, the presiding judge found that the two hearing orders issued in this case are sufficient to remove the requirements that the documents be kept confidential. Tr. 23. The judge based his finding on Order No. 509–A, announcing a statement of policy under the Natural Gas Act.[11] Order No. 509–A provides that the Natural Gas Act's section 8(b) restraint on disclosing information—the counterpart of the Federal Power Act's section 301(b)—did not prohibit the Commission's blanket authorization of disclosure of information in cases scheduled for formal hearings if the information is relevant to the case. order No. 509–A cites the legislative history of section 301(b) as the basis for a blanket authorization to disclose information. 52 FPC at 391. The presiding judge reasoned that because the Commission in Order No. 509–A found that section 8(b) of the Natural Gas Act originated in the legislative history of section 301(b), the statement of policy in Order No. 509–A regarding gas proceedings may also be applied to electric proceedings. He concluded that the Commission's issuance of the two orders in this proceeding authorizes use of the documents in this proceeding and their release from the confidential status they may previously have had, and thus, satisfies section 301(b). Tr. 24.

In Order No. 509–A, while the Commission cited the legislative history of section 301(b) as basis for its blanket authorization under the Natural Gas Act, the Commission did not specifically extend that statement of policy to proceedings under the FPA. However, the Commission believes that the authorization of the release of information specified in Order No. 509–A for natural gas proceedings and the underlying rationale are equally applicable in other Commission proceedings, *i.e.*, in proceedings under the FPA, and should be applied in this case.[12] Thus, section 301(b)'s restraint on disclosing information does not prohibit the Commission's authorization of disclosure of information in cases, such as this, which are set for formal hearing if the information is relevant to the case. Rather, section 301(b) merely provides that information cannot be released without authorization.

We believe that hearing orders, such as the hearing orders in this proceeding, should be read to authorize the release of information obtained during the course of an audit, such as the documents in question, in those cases set for formal hearing.[13] However, to the extent that an additional order under the FPA is necessary, this order authorizes the release of the information at issue in this proceeding.

In addition, to avoid any future misunderstandings, this order specifically extends the policy statement in Order No. 509–A to jurisdictional proceedings under the FPA, as well as to proceedings under the Interstate Commerce Act as it applies to the regulation of oil pipelines. Thus, we will amend 18 CFR 2.72, as set forth below. This revised statement of policy is effective December 28, 1992.

The Commission Orders:

The Company's interlocutory appeal is hereby denied, as discussed in the body of this order.

List of Subjects in 18 CFR Part 2

Administrative practice and procedure, Electric power, Natural gas, Pipelines, Reporting and recordkeeping requirements.

In consideration of the foregoing, the Commission is amending part 2, chapter I, title 18, Code of Federal Regulations, as set forth below.

---

[8] The Third Circuit specifically rejected the argument that the work product privilege was not waived because the company reasonably expected the agencies to keep the documents confidential. Westinghouse, 951 F.2d at 1430.

[9] Contrary to the Company's suggestion, ordering an evidentiary hearing does not make this a different proceeding.

[10] *See* Consolidated Gas Supply Corporation, 16 FERC ¶ 61,234 at 61,502 (1981) (citing and quoting from *Permian* approvingly). *Accord,* Tenneco, Inc., *et al.,* Opinion No. 41, 7 FERC ¶ 61,258 at 61,541–42 (1979). *See also* Pennzoil Louisiana and Texas Offshore Co., Inc., *et al.,* 3 FERC ¶ 61,133 at 61,382 & 61,396 n.1 (1988).

[11] This policy was codified in 18 CFR 2.72, which provides that: Pursuant to the Commission's authority under the Natural Gas Act, particularly subsection (b) of section 8 thereof, upon request by a party to the proceedings, or as required in conjunction with the presentation of a Commission staff case or staff's cross-examination of any other presentation therein, all relevant information acquired by Commission staff, including workpapers pursuant to any staff investigation conducted under sections 8, 10, or 14 of the Natural Gas Act shall, without further order of the Commission, be free from the restraints of said subsection (b) of section 8 regarding the divulgence of information, with respect to any matter hereafter set for formal hearing.

[12] See 52 FPC at 390, 391–92; Availability of Information Acquired by Staff Investigation, Order No. 509, 51 FPC 1439, 1439–40, *order on reh'g,* Order No. 509–A, 52 FPC 389 (1974). Accord, 7 FERC at 61,541–42 & 61,549 n.51; 3 FERC at 61,382.

By the Commission.

Lois D. Cashell,

Secretary.

PART 2—GENERAL POLICY AND INTERPRETATIONS

1. The authority citation for part 2 continues to read as follows:

Authority: 15 U.S.C. 717–717w, 3301–3432; 16 U.S.C. 792–825r, 2601–2545; 42 U.S.C. 4321–4361, 7101–7352.

2. Section 2.72 is redesignated as section 2.1b and is revised to read as follows:

§ 2.1b Availability in contested cases of information acquired by staff investigation.

Pursuant to the Commission's authority under the Natural Gas Act, particularly subsection (b) of section 8 thereof, under the Federal Power Act, particularly subsection (b) of section 301 thereof, and under the Interstate Commerce Act as it applies to regulation of oil pipelines, particularly subsection (7)(f) of section 20 thereof, upon request by a party to the proceedings, or as required in conjunction with the presentation of a Commission staff case or staff's cross-examination of any other presentation therein, all relevant information acquired by Commission staff, including workpapers pursuant to any staff investigation conducted under sections 8, 10, or 14 of the Natural Gas Act, sections 301, 304 or 307 of the Federal Power Act, and sections 12 and 20 of the Interstate Commerce Act as it applies to regulation of oil pipelines shall, without further order of the Commission, be free from the restraints of said subsection (b) of section 8 of the Natural Gas Act, subsection (b) of section 301 of the Federal Power Act, and subsection (7)(f) of section 20 of the Interstate Commerce Act as it applies to regulation of oil pipelines regarding the divulgence of information with respect to any matter hereafter set for formal hearing.

BILLING CODE 6717–01–M

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Food and Drug Administration

21 CFR Part 5

Delegations of Authority and Organization; Counterfeit Drugs Enforcement Activities

AGENCY: Food and Drug Administration, HHS.

ACTION: Final rule.

SUMMARY: The Food and Drug Administration (FDA) is amending the regulations for delegations of authority relating to enforcement activities concerning counterfeit drugs. The amendment clarifies the authority of FDA criminal investigators and the description of the official credentials issued to them.

EFFECTIVE DATE: January 6, 1993.

FOR FURTHER INFORMATION CONTACT: Ellen Rawlings, Division of Management Systems and Policy (HFA–340), Food and Drug Administration, 5600 Fishers Lane, Rockville, MD 20857, 301–443–4976.

SUPPLEMENTARY INFORMATION: In a May 24, 1991, **Federal Register** notice (56 FR 23788), FDA amended the regulations for delegations of authority for § 5.35 *Enforcement activities* (21 CFR 5.35). FDA added to the authorities delegated to officers and employees of FDA-issued official credentials by delegating authority to criminal investigators to conduct certain activities under section 702(e)(1) through (e)(5) of the Federal Food, Drug, and Cosmetic Act (the act), as amended (21 U.S.C. 372(e)(1) through (e)(5)). This amendment clarifies the authority of the criminal investigators to perform other functions under the act, or any other law, as the Commissioner of Food and Drugs may prescribe. This amendment also clarifies the description of the official credentials, consisting of a two part Form FDA–200D, Special Authority for Criminal Investigations, issued to the criminal investigators.

List of Subjects in 21 CFR Part 5

Authority delegations (Government agencies), Imports, Organization and functions (Government agencies).

Therefore, under the Federal Food, Drug, and Cosmetic Act and under authority delegated to the Commissioner of Food and Drugs, 21 CFR part 5 is amended as follows:

PART 5—DELEGATIONS OF AUTHORITY AND ORGANIZATION

1. The authority citation for 21 CFR part 5 continues to read as follows:

Authority: 5 U.S.C. 504, 552, App. 2; 7 U.S.C. 138a, 2271; 15 U.S.C. 638, 1261–1282, 3701–3711a; secs. 2–12 of the Fair Packaging and Labeling Act (15 U.S.C. 1451–1461); 21 U.S.C. 41–50, 61–63, 141–149, 467f, 679(b), 801–886, 1031–1309; secs. 201–903 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321–394); 35 U.S.C. 156; secs. 301, 302, 303, 307, 310, 311, 351, 352, 361, 362, 1701–1706, 2101 of the Public Health Service Act (42 U.S.C. 241, 242, 242a, 242l, 242n, 243, 262, 263, 264, 265, 300u–300u–5, 300aa–1); 42 U.S.C. 1395y, 3246b, 4332, 4831(a), 10007–10008; E.O. 11490, 11921, and 12591.

2. Section 5.35 is amended by revising the introductory text of paragraph (b), by redesignating paragraphs (b)(1) through (b)(5) as (b)(1)(i) through (b)(1)(v), by adding new paragraphs (b)(1) introductory text and (b)(2), and by revising paragraph (c)(3) to read as follows:

§ 5.35 Enforcement activities.

(a) * * *

(b) Any officer or employee of the Food and Drug Administration who has been designated by the Commissioner to conduct examinations, investigations, or inspections under the act relating to counterfeit drugs and issued the Food and Drug Administration Official Credential consisting of Form FDA–200D, Special Authority for Criminal Investigators, is authorized to do the following:

(1) As set forth under section 702(e)(1) through (e)(5) of the act:

* * * * *

(2) Perform such other functions under the act, or any other law, as the Commissioner of Food and Drugs may prescribe.

(c) * * *

(3) Form FDA–200D, entitled "Special Authority for Criminal Investigators," is in two parts and bears the holder's name, a color photograph, the signature of the holder, his or her special authority under 21 U.S.C. 334 and 372 and other duties as assigned by the Commissioner, an identification number, the Commissioner's or his designee's signature, the names of the Department of Health and Human Services, the Public Health Service, and the Food and Drug Administration. Part 1 of the form is superimposed with the symbol FDA with blue imprint, and part 2 is superimposed with the FDA criminal investigator's badge with blue imprint.

Dated: December 30, 1992.

William K. Hubbard,

Acting Deputy Commissioner for Policy.

BILLING CODE 4160–01–F

Substance Abuse and Mental Health Services Administration

Food and Drug Administration

21 CFR Part 291

[Docket No. 88N–0444]

Methadone in Maintenance Treatment of Narcotic Addicts; Joint Revision of Conditions for Use; Interim Maintenance Treatment; Human Immunodeficiency Virus Disease Counseling

AGENCIES: Food and Drug Administration and Substance Abuse and Mental Health Services Administration, HHS.

ACTION: Final rule.

SUMMARY: The Food and Drug Administration (FDA) and the Substance Abuse and Mental Health Services Administration (SAMHSA) formerly the Alcohol, Drug Abuse, and Mental Health Administration (ADAMHA) are revising the conditions for the use of methadone in the maintenance treatment of narcotic addicts. The final rule allows, contingent on FDA and State approval, public and nonprofit private narcotic treatment programs to provide interim maintenance treatment to patients awaiting placement in comprehensive maintenance treatment and to require all narcotic treatment programs to provide counseling on preventing exposure to, and the transmission of, human immunodeficiency virus (HIV) disease.

EFFECTIVE DATE: January 6, 1993.

FOR FURTHER INFORMATION CONTACT: Thomas C. Kuchenberg, Center for Drug Evaluation and Research (HFD–362), Food and Drug Administration, 7500 Standish Pl., Rockville, MD 20855, 301–295–8046.

SUPPLEMENTARY INFORMATION:

I. Background

A. Summary of the Proposal

In the **Federal Register** of March 2, 1989 (54 FR 8973) (corrected in the **Federal Register** of March 27, 1989 (57 FR 12531)), FDA and the National Institute on Drug Abuse (NIDA) jointly published a proposed regulation to revise the conditions for the use of methadone in the maintenance treatment of narcotic addicts. The proposal would allow narcotic treatment programs to provide interim maintenance treatment to patients awaiting placement in comprehensive maintenance treatment and require such programs to provide counseling on avoidance and transmission of HIV disease. Prompted by the HIV epidemic in the intravenous (IV) drug abuser population and evidence that methadone treatment is an effective method of limiting the transmission of HIV among this population, the proposal was intended to allow narcotic treatment programs greater flexibility in admitting narcotic addicts into treatment. The proposal specifically solicited comments on several unresolved issues that are important to the successful implementation of interim maintenance treatment. Those issues included: (1) The elements of a policy for transferring patients from interim maintenance treatment to comprehensive maintenance treatment, (2) the question of requiring mandatory HIV testing in methadone treatment programs, (3) the utility of requiring random urine testing of interimcare patients, (4) the question of allowing "stand alone" interim maintenance clinics, and (5) other limitations (allowable number of interim patients, ratio of interim patients to comprehensive patients) on the interim maintenance treatment modality.

In the **Federal Register** of April 6, 1989 (54 FR 13897), FDA and NIDA extended the comment period on the proposal until May 3, 1989. This action was based on several requests for extension of the comment period.

B. Administrative Record

FDA and NIDA received over 80 comments on the proposal. These comments represented many interests—members of Congress; Federal, State, and local government authorities; narcotic treatment programs and counseling services; professional associations representing administrators, physicians, and treatment programs; and national organizations for HIV prevention and treatment research. Comments on the proposed interim maintenance provisions revealed large differences of opinion both on the desirability of adopting the interim maintenance provisions and on a number of related issues as well. Some comments were concerned with the possible detrimental effect proposed interim maintenance treatment would have on comprehensive maintenance treatment. Other comments questioned the existence of an extensive, nationwide, or regional waiting list problem associated with methadone maintenance programs. Because of these differing views and in light of comments urging that an expert meeting be convened to addressed the complex issues posed by the proposal, the agencies concluded that it was necessary to solicit additional information before making a final decision. Therefore, FDA and NIDA jointly published a notice in the **Federal Register** of December 4, 1989 (54 FR 50226), announcing a public hearing to be convened on February 28, 1990, to obtain further public comment and factual information on the unresolved issues. The December 4, 1989, notice specifically sought comments on the likely success of the interim maintenance treatment approach to decrease the spread of HIV infection among IV drug abusers. In addition, the agencies sought help in assessing the extent to which demand for methadone maintenance treatment exceeds current treatment resources, and the likely impact that interim maintenance treatment would have in shortening the waiting lists for entry into methadone treatment programs. Finally, the agencies sought help in developing standards for interim maintenance treatment should interim maintenance rules be adopted.

At the February 28, 1990, public hearing, 28 individuals representing 20 organizations made oral presentations on these and related issues before a panel composed of representatives from FDA, NIDA, and other Public Health Service organizations. A transcript of the hearing and additional written information were placed in the administrative record.

FDA and NIDA evaluated the data, evidence, and testimony submitted as part of the February 28, 1990, public hearing, together with the written comments submitted in response to the March 2, 1989, proposed rule. Several comments stressed the potential importance of interim maintenance in checking the spread of AIDS. Representatives of an interim program, operating under a § 291.505(d)(11) exemption (21 CFR 291.505(d)(11)), indicated that they had witnessed a substantial decline in high risk heroin use among those participating in the program. While submissions indicated some regional shortages of methadone treatment capacity, the administrative record does not disclose significant national shortages in the availability of methadone maintenance treatment slots. Several comments noted that the exemption process currently provided for in § 291.505(d)(11), and described in the preamble of the public hearing notice that was published December 4, 1989 (54 FR 50226 at 50227), would provide for treatment modifications similar to the proposed interim maintenance approach. The comments suggested that this exemption process could be applied on a case-by-case basis

to relieve regional or State overcrowding.

Extensive information was presented in the administrative record regarding the current "poly-drug abuse" profile of IV narcotic addicts and the concomitant need to focus counseling and other rehabilitative services available in comprehensive maintenance treatment on narcotic addicts with multiple addictions entering treatment. Many comments contended that the resources and funding that participating methadone treatment programs would have to provide to offer the proposed interim maintenance treatment would be at the expense of the current comprehensive maintenance treatment and would therefore diminish the role of comprehensive narcotic treatment programs in reducing IV drug abuse. In light of this concern, a considerable number of comments concluded that interim maintenance would fail to decrease the incidence of IV drug abuse and the transmission of HIV disease nationwide.

In addition, the agencies have also considered reports regarding the effectiveness of drug abuse treatment prepared in 1990 by the General Accounting Office (GAO) and the Office of Technology Assessment (OTA). The GAO report concluded that its research findings did not support the effectiveness of proposed interim maintenance in reducing IV drug use and in reducing the corresponding risk of Acquired Immunodeficiency Syndrome (AIDS). The OTA report stated that interim methadone maintenance programs may be more appropriate for certain geographical areas, such as those with large numbers of IV drug users and long waiting lists.

C. ADAMHA Reorganization Act

On July 10, 1992, the ADAMHA Reorganization Act (the Act) became law (Pub. L. 102–321). Pursuant to the reorganization provisions of Title I of the Act, ADAMHA has been restructured to transfer its substance abuse and mental health research institutes, including NIDA, to the National Institutes of Health and to establish SAMHSA to administer substance abuse and mental health prevention and treatment services programs. Thus, unless specifically provided otherwise by the Act, all service-related functions formerly exercised by ADAMHA or its entities, including NIDA, have been transferred to SAMHSA. The reorganization provisions under Title I of the Act were effective on October 1, 1992.

The Act amended the PHS Act and requires the Secretary of Health and Human Services (the Secretary), after consultation with the National Commission or Acquired Immunodeficiency Syndrome (NCAIDS), to issue a final rule establishing interim maintenance treatment regulations and the conditions for public and nonprofit private programs to obtain authorization from the Secretary to provide such treatment. Section 1976(b)(1) of the PHS Act, as amended by section 202 of the ADAMHA Reorganization Act, provides that interim maintenance treatment regulations do not need to be promulgated if the Secretary finds that one or more of three conditions exist. These conditions are that:

(1) "The preponderance of scientific research indicates that the risk of transmission of HIV disease pursuant to the intravenous abuse of drugs is minimal;" (2) "the preponderance of scientific research indicates that the medically supervised dispensing of methadone is not an effective method of reducing the extent of dependence on heroin and other morphine-like drugs;" or (3) "the preponderance of available data indicates that, of treatment programs that dispense methadone as part of comprehensive treatment, a substantial majority admit all individuals seeking services to the programs not later than 14 days after the individuals seek admission to the programs." Further, section 1976(b)(2) of the PHS Act requires the Secretary to consult with NCAIDS to determine one or more of those conditions have been met.

With the concurrence of NCAIDS, the Secretary has determined that none of these conditions has been met. First, the Secretary has determined that the preponderance of scientific research indicates that IV abuse of drugs is, in fact, a primary pathway for HIV disease transmission and as such constitutes a major public health problem. Second, the Secretary has determined that the preponderance of scientific research indicates that the medically supervised dispensing of methadone continues to be an effective method of reducing dependence on heroin and other morphine-like drugs.

Finally, the Secretary has determined that the preponderance of available data does not indicate that, of treatment programs that dispense methadone as part of comprehensive treatment, a substantial majority admit all individuals seeking services to the programs not later than 14 days after the individuals seek admission to the programs. Because waiting lists are currently not an accurate measure of the number of individuals seeking treatment services or in need of treatment services, the Secretary does not believe that the available data could support a finding of inapplicability for this condition. Therefore, the Secretary, after consultation with NCAIDS, has determined that the conditions for the use of methadone should be revised to allow public and nonprofit private narcotic treatment programs to provide interim maintenance treatment to patients awaiting placement in comprehensive maintenance treatment. Further, to provide HIV disease counseling to all individuals seeking treatment, the Secretary has decided the methadone regulations should be revised in § 291.505(d)(4)(i)(C) to require all narcotic treatment programs offering maintenance and detoxification treatment to provide counseling to each patient on exposure to, and the transmission of, HIV disease.

Current narcotic treatment regulations require a tuberculin skin test to be included in each patient's initial medical evaluation. In view of the recent increase in tuberculosis cases, the agencies emphasize the importance of the tuberculin skin test required under § 291.505(d)(3) as part of the medical evaluation given each patient at the time of admission. Programs are also encouraged to periodically retest patients who had negative tuberculin skin tests on admission. In addition, the agencies encourage programs to routinely perform tuberculin skin tests for all program personnel at the start of employment and all current employees who have not recently received a tuberculin skin test. Programs are encouraged to periodically retest all program employees with negative skin tests. Programs are encouraged to maintain records on the tuberculin skin testing results of both patients and staff. All tuberculin skin tests should be administered intradermally using the Mantoux technique, or, when available, a procedure of equal or better sensitivity.

Any patient or staff member with a positive skin test or clinical evidence of possible tuberculosis disease needs a prompt medical evaluation and appropriate treatment.

Methadone treatment programs should report all patients or staff who have tuberculosis disease to State and local health departments.

II. Interim Maintenance Treatment

Section 1976(c)(1) of the PHS Act requires the Secretary, after consultation with NCAIDS, to issue regulations containing the conditions for public and nonprofit private narcotic treatment programs to obtain authorization from

the Secretary and the chief public health officer of the State to provide interim maintenance treatment. Such conditions shall include conditions for preventing the unauthorized use of methadone. In addition, the Secretary expects that the State public health officer will consult with the State Alcohol and Drug Abuse Director. Section 1976(c)(4) of the PHS Act also requires the Secretary to issue a final rule providing for interim maintenance treatment not later than 180 days after enactment. If a final rule is not promulgated by that time, the proposed rule of March 2, 1989, and the mandated provisions of the Act will take effect as a final rule. Therefore, under section 1976(c)(4) of the PHS Act, FDA and SAMHSA are promulgating this final rule that is based on the proposed rule of March 2, 1989, and mandated provisions of the PHS Act.

Provisions of the ADAMHA Reorganization Act other than those requiring interim maintenance treatment, such as the substance abuse block grant provisions, also affect interim maintenance treatment. Consistent with the PHS Act, the interim maintenance treatment provisions proposed in 1989 are being finalized with changes to incorporate all of the requirements of the Act. These are as follows: First, § 291.505(b)(1)(v) the applicability of interim maintenance treatment regulations is limited to public and nonprofit private narcotic treatment programs that are approved in accordance with § 291.505(c). Secondly, § 291.505(d)(7) provides that a public or nonprofit private narcotic treatment program may place a patient, otherwise eligible for admission to comprehensive maintenance treatment, in interim maintenance only if the program is unable to place the patient in comprehensive treatment in a public or nonprofit private program within a reasonable geographic area within 14 days of seeking admission. Thirdly, § 291.505(b)(2)(vi) provides that a public or nonprofit private narcotic treatment program, to provide interim maintenance treatment, must obtain authorization from FDA and the chief public health officer of the State. Before such authorization is granted by FDA, the program must provide FDA with written certification from the chief public health officer of the State that he or she does not object to interim maintenance treatment in the State and that interim maintenance treatment programs will not reduce the capacity or fiscal support of comprehensive maintenance treatment programs to admit individuals (relative to the date on which such officer so certifies). The Secretary expects that the States will ensure that interim maintenance programs are given appropriate guidance in order to assure that, before admitting a patient, comprehensive treatment in a public or nonprofit private program was not available to the patient within a reasonable geographic area. The Secretary also expects that, as part of the certification process, a State's chief public health officer will consult with the State agency charged with oversight of substance abuse programs utilizing methadone. If a State certifies interim maintenance treatment the State must establish appropriate and reasonable criteria to ensure that interim care is provided in a manner consistent with Federal law and that no individual continues in such a program for more than a total of 120 days for a 12-month period.

Fourth, consistent with section 1923 of the PHS Act, a State must make comprehensive treatment available to any individual who requests and is in need of treatment for intravenous drug abuse within 120 days of the date of such request. Thus, patients may only be admitted to, and treated with, interim maintenance for a period up to and including 120 days per 12-month period. After 120 days, patients must be transferred to a comprehensive program if they are still in need of treatment. The program must notify the State health officer both when interim treatment begins and before the 120-day period expires and document these notifications.

Fifth, § 291.505(d)(7) provides that consistent with section 1927(a) of the PHS Act, a State must ensure that programs within the State providing interim maintenance services give preference in admission to interim care and transfer to comprehensive care to pregnant women who seek or are referred to and would benefit from such services. The Department of Health and Human Services (DHHS) will monitor closely interim maintenance treatment programs.

The final regulation does not require programs to maintain a specific counselor to patient ratio. However, programs are required to provide a number of services (e.g., referrals to such services as medical services, prenatal care, HIV counseling). Accordingly, programs should assure that sufficient counseling staff is available to provide these services. In addition, programs should assure that counseling staff is available to respond to patient emergency situations.

The Secretary advises that, in addition to the initial drug screening, interim programs should perform a minimum of two additional drug screenings. The Secretary recommends that programs perform more frequent tests to assist in assessing patient needs and priorities for transfer to comprehensive programs.

III. HIV Disease Counseling

Section 1976(c)(2) of the PHS Act requires that the Secretary not authorize the provision of interim maintenance unless the public and nonprofit private program provides patients with counseling on preventing exposure to, and the transmission of, HIV disease. Additionally, the March 2, 1989, interim maintenance treatment proposal included a provision requiring all narcotic treatment programs offering maintenance or detoxification treatment to provide counseling on avoiding the transmission of HIV disease. This requirement was uniformly supported by received comments. Therefore, FDA and SAMHSA, in § 291.505(d)(4)(i)(C) are also finalizing that portion of the March 2, 1989, proposal requiring all narcotic treatment programs to provide counseling to each patient on preventing exposure to, and transmission of, HIV disease. This counseling shall be provided upon entrance to all types of maintenance and detoxification treatment. Counseling should be repeated as necessary.

Although HIV testing is not required by this regulation, HIV testing is an important element in reducing the risk of HIV transmission. Accordingly, the agencies believe that HIV testing must be made accessible to patients who request it. If a program does not provide HIV testing on site, then the program shall counsel patients on other opportunities where availability of testing is assured through agreements with HIV testing facilities to make HIV testing accessible to patients who request it.

The final rule also amends the narcotic treatment regulations in § 291.505(a)(10) to include a definition for the term "HIV disease" as defined under section 1976(d)(2) of the PHS Act and a conforming amendment in § 291.505(d)(8)(i)(F) to include a requirement inadvertently omitted from the March 2, 1989, proposal requiring HIV disease counseling in the provisions for short-term detoxification.

IV. Environmental Impact

FDA has determined under 21 CFR 25.24(a)(8) that this action is of a type that does not individually or cumulatively have a significant effect on the human environment. Therefore, neither an environmental assessment

nor an environmental impact statement is required.

V. Economic Impact

FDA and SAMHSA have examined the regulatory impact and regulatory flexibility implications of the final rule in accordance with Executive Order 12291 and the Regulatory Flexibility Act (Pub. L. 96–354). The final rule will allow methadone treatment programs to provide minimum service (interim) maintenance treatment to patients awaiting placement in comprehensive treatment. This will allow narcotic addicts into treatment more quickly, thereby decreasing the incidence of intravenous drug abuse and the transmission of HIV. The agencies find that the final rule is not a major rule inasmuch as these revisions will not result in any significant increase in cost to narcotic treatment programs or to State and local authorities. In fact, this final rule will allow maintenance treatment of narcotic drug addicts at a lower cost per patient. In addition, the final rule establishes a provision requiring treatment programs to provide counseling on preventing exposure to, and the transmission of, HIV disease for each patient seeking admission and readmission to a treatment program.

The agencies estimated the costs of providing HIV disease counseling for a range of patients because of varying estimates of the census of patients under treatment nationally. The GAO report, "Methadone Maintenance" (March 1990), and SAMHSA estimate 100,000 patients are under treatment nationally, while other experts offered a higher estimate of 350,000 patients. In response to the proposed rule, one comment suggested an incremental cost of 80 cents per patient per day, but did not present information on the components of this cost.

For its cost analysis, the agencies have assumed that counselors earn $13 per hour and that patients on average would receive 1 hour of counseling. Based on these assumptions, the annual cost of providing HIV-disease counseling would be between $1,300,000 ($13/hour × 100,000 patients) and $4,550,000 ($13/hour × 350,000 patients). This cost estimate assumes that no narcotic treatment programs currently offer HIV-disease counseling. However, because some narcotic treatment programs currently already provide disease counseling, the actual costs will be less than the agencies' estimates. The requirements for referrals for other services already exist for providers of comprehensive services; thus, minimum incremental costs will be incurred in the provision of these referrals. In areas where there is a shortage of drug treatment slots, interim methadone maintenance provides a bridge to comprehensive treatment, thus reducing both HIV transmission and continued use of opiates. Even if interim methadone maintenance changes the behavior of only a few addicts, the potential savings from reducing the spread of HIV and reducing illicit drug use by facilitating entrance to a proven treatment modality, thereby reducing illicit drug use, are substantial.

For these reasons, therefore, the agencies have determined that this rule is not a major rule as defined in Executive order 12291. Further, FDA and SAMHSA certify that the rule will not have a significant impact on a substantial number of small entities as defined by the Regulatory Flexibility Act.

VI. Paperwork Reduction Act of 1980

The final rule contains information collections which are subject to review by the Office of Management and Budget (OMB) under the paperwork reduction Act of 1980. The title, description, and respondent description of the information collection are shown below with an estimate of the annual reporting and recordkeeping burden. Included in the estimate is the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information.

Title: Methadone, HIV Disease Counseling, Transfer Priority Criteria Evaluation Notation.

Description: FDA and SAMHSA are requiring this notation to ensure that a record exists of the transfer criteria evaluation, which is designed to help prevent interim maintenance treatment from becoming a long-term treatment modality for any patient.

Description of Respondents: State or local governments, businesses, or other organizations; nonprofit institutions. Estimated Annual Reporting and Recordkeeping Burden:

Section 291.505(d)(7).
Annual number of respondents: 20.
Annual frequency: 200.
Average burden per response: 5 minutes.
Annual burden hours: 333.

The agencies received no public comments on the estimated public reporting burden, and it remains the same as that contained in the proposed rule.

VII. Effective Date

This final rule is effective on January 6, 1993. The ADAMHA Reorganization Act requires that a final rule be effective not later than 180 days after its enactment (by January 6, 1993) or the proposed rule issued on March 2, 1989 (54 FR 8973) is deemed to take effect. The final rule also relieves a restriction, in that it will provide conditions for interim maintenance treatment to patients awaiting placement in comprehensive maintenance treatment programs. Therefore, the agencies find that the final rule is within the exemption to the Administrative Procedure Act (5 U.S.C. 553d) so that it can be made effective in less than 30 days.

List of Subjects in 21 CFR Part 291

Health professions, Methadone, Reporting and recordkeeping requirements.

Therefore, under the Comprehensive Drug Abuse Prevention and Control Act of 1970, the Narcotic Addict Treatment Act of 1974, and applicable delegations of authority thereunder, and under authority delegated to the Commissioner of Food and Drugs, 21 CFR part 291 is amended as follows:

PART 291—DRUGS USED FOR TREATMENT OF NARCOTIC ADDICTS

1. The authority citation for 21 CFR part 291 is revised to read as follows:

Authority: Secs. 505, 701 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 355, 371); 21 U.S.C. 823; secs. 301(d), 548, 1976 of the Public Health Service Act (42 U.S.C. 241(d), 290ee–3, 300y–11); 42 U.S.C. 257a.

2. Section 291.505 is amended by inserting the word "comprehensive" before the word "maintenance" everywhere it appears in paragraphs (d)(1)(i), (d)(1)(iii), (d)(1)(iv), (d)(2)(i), (d)(3)(v)(D), (d)(4)(i)(B)*2*), (d)(5)(ii), (d)(6)(iv)(B)(*6*), (d)(6)(v)(A)(*1*) and (d)(6)(v)(A)(*3*), (d)(6)(v)(C), (d)(8)(i) introductory text and (d)(8)(i)(E), (d)(9)(i) introductory text and (d)(9)(i)(F), and by revising paragraph (a)(2), by adding paragraphs (a)(10), (b)(1)(v), (b)(2)(vi), (d)(4)(i)(C), and (d)(7), and by revising paragraph (d)(8)(i)(F) to read as follows:

§ 291.505 Conditions for the use of narcotic drugs; appropriate methods of professional practice for medical treatment of the narcotic addiction of various classes of narcotic addicts under section 4 of the Comprehensive Drug Abuse Prevention and Control Act of 1970.

(a) * * *

(2) *Maintenance treatment* means the dispensing of a narcotic drug, at relatively stable dosage levels, in the treatment of an individual for dependence on heroin or other morphine-like drug. There are two types of maintenance treatment:

comprehensive maintenance treatment and interim maintenance treatment.

(i) *Comprehenisve maintenance treatment* is maintenance treatment provided in conjunction with a comprehensive range of appropriate medical and rehabilitative services.

(ii) *Interim maintenance treatment* is maintenance treatment provided in conjunction with appropriate medical services while a patient is awaiting transfer to comprehensive maintenance treatment.

* * * * *

(10) The term *HIV disease* means infection with the etiologic agent for acquired immunodeficiency syndrome.

* * * * *

(b) * * *

(1) * * *

(v) *Interim maintenance treatment.* A public or nonprofit private narcotic treatment program may provide interim maintenance treatment only if the program also provides comprehensive maintenance treatment to which interim maintenance treatment patients may be transferred.

(2) * * *

(vi) *Interim maintenance treatment program approval.* Before a public or nonprofit private narcotic treatment program may provide interim maintenance treatment, the program must receive approval of both the Food and Drug Administration and the chief public health officer of the State. Before such approval is granted, the program must provide the Food and Drug Administration with certification from the chief public health officer of the State that:

(A) Such officer does not object to the authorization of programs providing interim maintenance treatment in the State and that programs seeking such authorization are unable to place patients in a public or nonprofit private comprehensive treatment program within a reasonable geographic area within 14 days of the time patients seek admission to such programs;

(B) The authorization of programs providing interim maintenance treatment in the State will not reduce the capacity of comprehensive programs in the State to admit individuals to these programs (relative to the date on which such officer so certifies);

(C) The State guarantees that individuals enrolled in interim maintenance treatment will be transferred to comprehensive programs not later than 120 days, as provided by section 1923 of the Public Health Service Act (the PHS Act) and applicable regulations; and

(D) Requests for authorization should be submitted to the address specified in § 291.505(k).

* * * * *

(d) * * *

(4) * * *

(i) * * *

(C) *Counseling on HIV disease.* A narcotic treatment program shall provide counseling on preventing exposure to, and the transmission of, HIV disease for each patient admitted or readmitted to maintenance or detoxification treatment. Although HIV testing is not required, an interim program shall inform patients of the availability of HIV testing. The program sponsor shall also ensure that HIV testing is accessible to patients who request such testing either on site or by the programs entering into agreements with HIV testing facilities to make HIV testing accessible to those patients who request it.

* * * * *

(7) *Minimum standards for interim maintenance treatment.* The person(s) responsible for a program may place an individual, who is eligible for admission to comprehensive maintenance treatment, in interim maintenance treatment if the individual cannot be placed in a public or nonprofit private comprehensive program within a reasonable geographic area and within 14 days of the individual's application for admission. An initial and at least two other urine screens shall be taken from interim patients during the maximum of 120 days permitted for such treatment. A program shall establish and follow reasonable criteria for establishing priorities for transferring patients from interim maintenance to comprehensive maintenance treatment. These transfer criteria shall be in writing and available for inspection and shall include, at a minimum, a preference for pregnant women in admitting patients to interim maintenance and in transferring patients from interim maintenance to comprehensive maintenance treatment. Interim maintenance shall be provided in a manner consistent with all applicable Federal and State laws including sections 1923 (mandatory transfer) and 1927(a) (pregnant patients) of the PHS Act. The program shall notify the State health officer when a patient begins interim treatment, when a patient leaves interim treatment, and before the date of mandatory transfer to a comprehensive program, and shall document such notifications. Programs in States not in compliance with provisions of this regulation risk loss of authorization for interim maintenance. All requirements for comprehensive maintenance treatment apply to interim maintenance treatment with the following exceptions:

(i) The narcotic drug is required to be administered daily under observation;

(ii) Take-home medication is not allowed;

(iii) The initial treatment plan and periodic treatment plan evaluation are not required;

(iv) A primary counselor is not required to be assigned to a patient;

(v) Interim maintenance cannot be provided for longer than 120 days in any 12 month-period; and

(vi) The requirements and exceptions in paragraphs (b)(2)(iii) (as apply to rehabilitative services), in paragraphs (b)(3)(iv)(B) and (d)(4)(i)(A) (as apply to rehabilitative services), and in paragraphs (d)(4)(ii)(E), (d)(4)(ii)(F), (d)(4)(iv), (d)(6)(iv), (d)(6)(v), (d)(6)(vi), and (d)(6)(vii) of this section do not apply.

* * * * *

(8) * * *

(i) * * *

(F) The requirements of paragraph (d)(4) of this section, except paragraphs (d)(4)(i)(C), (d)(4)(ii)(A) through (d)(4)(ii)(D), and (d)(4)(iii) of this section, do not apply to short-term detoxification treatment.

BILLING CODE 4160–17–M

Food and Drug Administration

21 CFR Part 522

Implantation or Injectable Dosage Form New Animal Drugs; Diazepam Injection

AGENCY: Food and Drug Administration, HHS.

ACTION: Final rule.

SUMMARY: The Food and Drug Administration (FDA) is amending the animal drug regulations to reflect approval of a new animal drug application (NADA) filed by Hoffmann-La Roche Inc. The NADA provides for the use of diazepam injection as a preanesthetic agent to reduce the amount of barbiturate required for short duration anesthesia in dogs.

EFFECTIVE DATE: January 6, 1993.

FOR FURTHER INFORMATION CONTACT: Marcia K. Larkins, Center for Veterinary Medicine (HFV–112), Food and Drug Administration, 7500 Standish Pl., Rockville, MD 20855, 301–295–8614.

SUPPLEMENTARY INFORMATION: Hoffmann-La Roche, Inc., Nutley, NJ 07110, filed NADA 140–848 which provides for intravenous use of Veteeze® (diazepam) injection for dogs as a preanesthetic agent to reduce the amount of barbiturate required for short duration anesthesia. The NADA is approved as of December 17, 1992, and the regulations are amended by adding new § 522.575 (21 CFR 522.575) to reflect the approval. The basis of approval is discussed in the freedom of information summary.

In accordance with the freedom of information provisions of part 20 (21 CFR part 20) and § 514.11(e)(2)(ii) (21 CFR 514.11(e)(2)(ii)), a summary of safety and effectiveness data and information submitted to support approval of this application may be seen in the Dockets Management Branch (HFA–305), Food and Drug Administration, rm. 1–23, 12420 Parklawn Dr., Rockville, MD 20857, between 9 a.m. and 4 p.m., Monday through Friday.

Under section 512(c)(2)(F)(i) of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 360b(c)(2)(F)(i)), this approval qualifies for 5 years of marketing exclusivity beginning December 17, 1992, because no active ingredient (including any ester or salt thereof) has been approved previously in any other NADA.

The agency has carefully considered the potential environmental effects of this action. FDA has concluded that the action will not have a significant impact on the human environment, and that an environmental impact statement is not required. The agency's finding of no significant impact and the evidence supporting that finding, contained in an environmental assessment, may be seen in the Dockets Management Branch (address above) between 9 a.m. and 4 p.m., Monday through Friday.

List of Subjects in 21 CFR Part 522

Animal drugs.

Therefore, under the Federal Food, Drug, and Cosmetic Act and under authority delegated to the Commissioner of Food and Drugs and redelegated to the Center for Veterinary Medicine, 21 CFR part 522 is amended as follows:

PART 522—IMPLANTATION OR INJECTABLE DOSAGE FORM NEW ANIMAL DRUGS

1. The authority citation for 21 CFR part 522 continues to read as follows:

Authority: Sec. 512 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 360b).

2. New § 522.575 is added to read as follows:

§ 522.575 Diazepam injection.

(a) *Specification.* Each milliliter of sterile solution contains 5 milligrams of diazepam.

(b) *Sponsor.* See 000004 in § 510.600(c) of this chapter.

(c) *Conditions of use. Dogs*—(1) *Indications for use.* As a preanesthetic agent to reduce the amount of barbiturate required for short duration anesthesia.

(2) *Dosage.* Intravenously, 0.2 milligram per kilogram of body weight 3–5 minutes before anesthesia is to be induced using a short acting barbiturate.

(3) *Limitations.* Not for use in dogs with known sensitivity to benzodiazepines. Safety in animals intended for breeding and pregnant animals has not been established. Federal law restricts this drug to use by or on the order of a licensed veterinarian.

Dated: December 17, 1992.

Gerald B. Guest,

Director, Center for Veterinary Medicine.

[FR Doc. 93–99 Filed 1–5–93; 8:45 am]

BILLING CODE 4160–01–F

21 CFR Part 526

Intramammary Dosage Forms; Penicillin G Procaine in Oil

AGENCY: Food and Drug Administration, HHS.

ACTION: Final rule.

SUMMARY: The Food and Drug Administration (FDA) is amending the animal drug regulations to remove that portion reflecting approval of new animal drug application (NADA) held by Boehringer Ingelheim Animal Health, Inc., for procaine penicillin G for treatment of bovine mastitis. In a notice published elsewhere in this issue of the **Federal Register**, FDA is withdrawing approval of the NADA.

EFFECTIVE DATE: January 19, 1993.

FOR FURTHER INFORMATION CONTACT: Mohammad I. Sharar, Center for Veterinary Medicine (HFV–216), Food and Drug Administration, 7500 Standish Pl., Rockville, MD 20855, 301–295–8749.

SUPPLEMENTARY INFORMATION: In a notice published elsewhere in this issue of the **Federal Register**, FDA is withdrawing approval of NADA 65–466 held by Boehringer Ingelheim Animal Health, Inc., 2621 North Belt Hwy., St. Joseph, MO 64506, for procaine penicillin G bovine mastitis treatment. This final rule removes 21 CFR 526.1696a(f) to reflect the withdrawal of approval of the NADA.

List of Subjects in 21 CFR Part 526

Animal drugs.

Therefore, under the Federal Food, Drug, and Cosmetic Act and under authority delegated to the Commissioner of Food and Drugs and redelegated to the Center for Veterinary Medicine, 21 CFR part 526 is amended as follows:

PART 526—INTRAMAMMARY DOSAGE FORMS

1. The authority citation for 21 CFR part 526 continues to read as follows:

Authority: Sec. 512 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 360b).

§ 526.1696a [Amended]

2. Section 526.1696a *Penicillin G procaine in oil* is amended by removing paragraph (f).

Dated: December 16, 1992.

BILLING CODE 4160–01–F

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 271

[FRL–4552–5]

Minnesota: Schedule of Compliance for Modification of Minnesota's Hazardous Waste Program

AGENCY: Environmental Protection Agency.

ACTION: Notice of Minnesota's Compliance Schedule to adopt program modifications.

SUMMARY: On September 26, 1986, U.S. EPA promulgated amendments to the deadlines for State program modifications and published requirements for States to be placed on a compliance schedule to adopt necessary program modifications. U.S. EPA is today publishing a compliance schedule for Minnesota to modify its program, in accordance with § 271.21(g) to adopt Federal program modifications.

EFFECTIVE DATE: January 1, 1993.

FOR FURTHER INFORMATION CONTACT: Christine Klemme, Minnesota Regulatory Specialist, Office of RCRA, U.S. EPA, Region V, 77 W. Jackson, HRM–7J, Chicago, Illinois 60604, (312) 886–3715, [FTS (312) 886–3715].

SUPPLEMENTARY INFORMATION:

A. Background

Final authorization to implement the Federal hazardous waste program within the State is granted by U.S. EPA if the Agency finds that the State program: (1) Is "equivalent" to the Federal program, (2) is "consistent" with the Federal program and other State programs, and (3) provides for adequate enforcement (section 3006(b), 42 U.S.C. 6926(b)). U.S. EPA regulations for final authorization appear at 40 CFR 271.1–271.25. In order to retain authorization, a State must revise its program to adopt new Federal requirements by the cluster deadlines and procedures specified in 40 CFR 271.21. See 51 FR 33712, September 22, 1986, for a complete discussion of these procedures and deadlines.

B. Minnesota

Minnesota received final authorization of its base hazardous waste program on February 11, 1985 (see 49 FR 226). The State received authorization for program revisions effective on September 18, 1987, June 23, 1989, August 14, 1990, August 23, 1991, and May 18, 1992. Today U.S. EPA is publishing a compliance schedule for Minnesota to complete a program revision on two Federal regulations, the Burning of Hazardous Waste in Industrial Furnaces (56 FR 7134, February 21, 1991), and, the Petroleum Refinery Primary and Secondary Oil/Water/Solids Separation Sludge Listing (55 FR 46354, November 2, 1990). The adoption deadline under 40 CFR 271.21 for these Federal regulations was July 1,1992. Minnesota has been granted a six-month extension to address these rules.

Minnesota has determined that, due to resource constraints, a one year delay to address these rules is necessary. On September 23, 1992, a letter from the State was received requesting an extension. Therefore, U.S. EPA is granting a one year extension of time until January 1, 1994, to address these two rules.

Authority

This notice is issued under authority of sections 2002(a), 3006, and 7004(b) of the Solid Waste Disposal Act, as amended by the RCRA of 1976, as amended, 42 U.S.C. 6912(a), 6926, and 6974(b).

Dated: December 17, 1992.

David A. Ullrich,

Acting Regional Administrator.

[FR Doc. 93–195 Filed 1–5–93, 8:45 am]

BILLING CODE 6560–50–M

FEDERAL EMERGENCY MANAGEMENT AGENCY

44 CFR Part 64

[Docket No. FEMA–7559]

Suspension of Community Eligibility

AGENCY: Federal Insurance Administration, FEMA.

ACTION: Final rule.

SUMMARY: This rule identifies communities, where the sale of flood insurance has been authorized under the National Flood Insurance Program (NFIP), that are suspended on the effective dates listed within this rule because of noncompliance with the floodplain management requirements of the program. If FEMA receives documentation that the community has adopted the required floodplain management measures prior to the effective suspension date given in this rule, the suspension will be withdrawn by publication in the Federal Register.

EFFECTIVE DATES: The effective date of each community's suspension is the third date ("Susp.") listed in the fourth column of the following tables.

ADDRESSES: If you wish to determine whether a particular community was suspended on the suspension date, contact the appropriate FEMA Regional Office or the NFIP servicing contractor.

FOR FURTHER INFORMATION CONTACT: Frank H. Thomas, Assistant Administrator, Office of Loss Reduction, Federal Insurance Administration, 500 C Street, SW., room 417, Washington, DC 20472, (202) 646–2717.

SUPPLEMENTARY INFORMATION: The National Flood Insurance Program (NFIP), enables property owners to purchase flood insurance which is generally not otherwise available. In return, communities agree to adopt and administer local floodplain management aimed at protecting lives and new construction from future flooding. Section 1315 of the National Flood Insurance Act of 1968, as amended, 42 U.S.C. 4022, prohibits flood insurance coverage as authorized under the National Flood Insurance Program, 42 U.S.C. 4001 et seq., unless an appropriate public body adopts adequate floodplain management measures with effective enforcement measures. The communities listed in this document no longer meet that statutory requirement for compliance with program regulations, 44 CFR Part 59 *et seq.* Accordingly, the communities will be suspended on the effective date in the fourth column. As of that date, flood insurance will no longer be available in the community. However, some of these communities may adopt and submit the required documentation of legally enforceable floodplain management measures after this rule is published but prior to the actual suspension date. These communities will not be suspended and will continue their eligibility for the sale of insurance. A notice withdrawing the suspension of the communities will be published in the Federal Register.

In addition, the Federal Emergency Management Agency has identified the special flood hazard areas in these communities by publishing a Flood Insurance Rate Map (FIRM). The date of the FIRM if one has been published, is indicated in the fifth column of the table. No direct Federal financial assistance (except assistance pursuant to the Robert T. Stafford Disaster Relief and Emergency Assistance Act not in connection with a flood) may legally be provided for construction or acquisition of buildings in the identified special flood hazard area of communities not participating in the NFIP and identified for more than a year, on the Federal Emergency Management Agency's initial flood insurance map of the community as having flood-prone areas (section 202(a) of the Flood Disaster Protection Act of 1973, 42 U.S.C. 4106(a), as amended). This prohibition against certain types of Federal assistance becomes effective for the communities listed on the date shown in the last column.

The Administrator finds that notice and public comment under 5 U.S.C. 553(b) are impracticable and unnecessary because communities listed in this final rule have been adequately notified.

Each community receives a 6-month, 90-day, and 30-day notification addressed to the Chief Executive Officer that the community will be suspended unless the required floodplain management measures are met prior to the effective suspension date. Since these notifications have been made, this final rule may take effect within less than 30 days.

National Environmental Policy Act

This rule is categorically excluded from the requirements of 44 CFR part 10, Environmental Consideration. No environmental impact assessment has been prepared.

Regulatory Flexibility Act

The Federal Insurance Administrator has determined that this rule is exempt from the requirements of the Regulatory Flexibility Act because the National Flood Insurance Act of 1968, as amended, 42 U.S.C. 4022, prohibits flood insurance coverage unless an appropriate public body adopts adequate floodplain management measures with effective enforcement measures. The communities listed no longer comply with the statutory requirements, and, after the effective date, flood insurance will no longer be available in the communities unless they take remedial action.

Regulatory Impact Analysis

This rule is not a major rule under Executive Order 12291, Federal Regulation, February 17, 1981, 3 CFR, 1981 Comp., p. 127. No regulatory impact analysis has been prepared.

Paperwork Reduction Act

This rule does not involve any collection of information for purposes of the Paperwork Reduction Act, 44 U.S.C. 3501 et seq.

Executive Order 12612, Federalism

This rule involves no policies that have federalism implications under Executive Order 12612, Federalism, October 26, 1987, 3 CFR, 1987 Comp., p. 252.

Executive Order 12778, Civil Justice Reform

This rule meets the applicable standards of section 2(b)(2) of Executive Order 12778, October 25, 1991, 56 FR 55195, 3 CFR, 1991 Comp., p. 309.

DEPARTMENT OF TRANSPORTATION

Office of the Secretary

49 CFR Part 1

[OST Docket No. 1; Amdt. 1–252]

Organization and Delegation of Powers and Duties; Delegation of Authority to the Federal Highway Administrator

AGENCY: Office of the Secretary, DOT.

ACTION: Final rule.

SUMMARY: This document delegates to the Federal Highway Administrator the authority vested in the Secretary of Transportation by section 601 of the Pipeline Safety Act of 1992, Public Law 102–508, concerning the construction of the Page Avenue Extension Project in St. Charles and St. Louis Counties, Missouri. The purpose of this rulemaking is to amend 49 CFR part 1 to reflect this delegation.

EFFECTIVE DATE: January 6, 1993.

FOR FURTHER INFORMATION CONTACT: John Kraybill, Office of the Chief Counsel, Federal Highway Administration, 400 Seventh Street, SW., Washington, DC 20590 (202) 366–1367, or Steve Farbman, Office of the Assistant General Counsel for

Regulations and Enforcement, U.S. Department of Transportation, 400 Seventh Street, SW., Washington, DC 20590 (202) 366–9306.

SUPPLEMENTARY INFORMATION: The Secretary has determined that the authority vested in the Secretary by section 601 of the Pipeline Safety Act of 1992, Pub. L. 102–508, concerning the authority to waive the requirements of section 138 of title 23, United States Code, and section 303 of title 49, United States Code, and other authority relating to construction of the Page Avenue Extension Project in the State of Missouri should be delegated to the Federal Highway Administrator. Since this rule relates to Departmental management, organization, procedure, and practice, notice and comment on it are unnecessary and it may be made effective in fewer than 30 days after publication in the Federal Register.

List of Subjects in 49 CFR Part 1

Authority delegations (government agencies), Organizations and functions (government agencies).

PART 1—[AMENDED]

In consideration of the foregoing, part 1 of title 49, Code of Federal Regulations, is amended as follows:

1. The authority citation for 49 CFR part 1 continues to read as follows:

Authority: 49 U.S.C. 322.

2. Section 1.48 is amended by adding a new paragraph (jj), and the introductory text of the section is reprinted for the convenience of the reader, to read as follows:

§ 1.48 Delegations to Federal Highway Administrator.

The Federal Highway Administrator is delegated authority to—

* * * * *

(jj) Carry out the functions vested in the Secretary of Transportation by section 601 of the Pipeline Safety Act of 1992, Public Law 102–508, relating to construction of the Page Avenue Extension Project in Missouri.

Issued on: December 30, 1992.

Andrew H. Card, Jr.,

Secretary.

BILLING CODE 4910–62–M

DEPARTMENT OF COMMERCE

National Oceanic and Atmospheric Administration

50 CFR Part 672

[Docket No. 921240–2340]

RIN 0648–AE90

Groundfish of the Gulf of Alaska

AGENCY: National Marine Fisheries Service (NMFS), NOAA, Commerce.

ACTION: Final rule.

SUMMARY: NMFS announces a final rule to remove a provision from the regulations acting to define "pelagic trawl gear" for purposes of the time/area closures authorized by Amendment 18 to the Fishery Management Plan for Groundfish of the Gulf of Alaska (FMP). Amendment 18 expires on December 31, 1992. New time/area closure authority is provided by Amendment 26 to the FMP, which uses the definition of "pelagic trawl gear" appearing in 50 CFR 672.2.

EFFECTIVE DATE: Effective January 1, 1993.

ADDRESSES: Copies of the environmental assessment/regulatory impact review (EA/RIR) may be obtained from the North Pacific Fishery Management Council, P.O. Box 103136, Anchorage, AK 99510 (telephone 907–271–2809).

FOR FURTHER INFORMATION CONTACT: Susan J. Salveson, Fisheries Management Division, Alaska Region, NMFS, 907–586–7230.

SUPPLEMENTARY INFORMATION:

Background

The domestic and foreign groundfish fisheries in the exclusive economic zone (EEZ) of the Gulf of Alaska (GOA) are managed by the Secretary of Commerce (Secretary) in accordance with the FMP. The FMP was prepared by the North Pacific Fishery Management Council (Council) under the Magnuson Fishery Conservation and Management Act (Magnuson Act). The FMP is implemented by regulations appearing at 50 CFR part 611 for the foreign fishery and at 50 CFR part 672 for the U.S. fishery. General regulations that also pertain to U.S. fisheries appear at 50 CFR part 620.

Amendment 18 to the FMP, which expires December 31, 1992, authorizes time/area closures around Kodiak Island. paragraph (d) of 50 CFR 672.24 implements that authority.

A notice of proposed rulemaking was published in the Federal Register on October 15, 1992 (57 FR 47321) that invited comment on the continuation of time/area closures around Kodiak Island to protect sensitive king and Tanner crab habitat areas from on-bottom trawl operations as recommended by the Council under Amendment 26 to the FMP. The intent of that notice was to propose to implement the time/area closure authority of Amendment 26 by maintaining, without change paragraphs (d) (1) and (2) of 50 CFR 672.24 and removing paragraphs (d) (3) and (4), which act to define pelagic trawl gear for the sole purpose of time/area closures authorized by Amendment 18. Paragraphs (d) (3) and (4) require that each person using pelagic trawl gear in the Kodiak Island time/area closures maintain a working net-sonde device on the trawl, retain all net-sonde recordings on board the vessel, and maintain contact between the footrope and the seabed 10 percent or less of the period of any tow as indicated by the net-sonde device. Amendment 26 provides authority for time/area closures but uses the definition of pelagic trawl gear appearing in § 672.2. This definition defines pelagic trawl gear based on gear configuration rather than net-sonde device recordings (56 FR 2700, January 24, 1991). Unfortunately, because of a drafting error, the proposed amendatory language failed to propose removal of paragraphs (d) (3) and (4).

Response to Comments

Two letters of comment were received during the comment period. Comments are summarized and responded to below.

Comment 1: Regulations implementing Amendment 26 and its predecessor, Amendment 18, exemplify a wise approach to the conservation of the crab resource without unnecessarily impacting commercial fishing operations.

Response: NMFS notes this comment.

Comment 2: NMFS invited comment on the enforcement concerns about aerial monitoring of the time/area closures to non-pelagic trawl gear when pelagic trawl gear could still be deployed in the closed areas. These concerns are unfounded in the Gulf of Alaska (GOA). Pollock is the only pelagic trawl fishery in the GOA. All other groundfish trawl fisheries are prosecuted with non-pelagic trawl gear. Additionally, all non-pelagic groundfish fisheries are restricted by a single halibut bycatch limit that is apportioned into seasonal allowances. When a seasonal allowance is reached, the GOA is closed to directed fishing for groundfish by vessels using trawl gear, except that fishing for pollock with pelagic trawl gear may continue when directed fishing for pollock is open. The only time pelagic and non-pelagic trawl

gear operations simultaneously occur in the GOA is when directed fisheries for pollock and other groundfish are both open. The trawl fleet normally fishes for pollock at the beginning of each quarterly reporting period when quarterly apportionments of the annual pollock quota become available. Quarterly apportionments are harvested within a short time period and the trawl fleet typically shifts to other groundfish species during the remainder of the quarter. Therefore, monitoring of the non-pelagic trawl gear closures around Kodiak Island may only be complicated during the seasonal openings of the pollock fishery. NMFS enforcement need not resort to aerial monitoring in this case, but could simply confirm a vessel's participation in the pelagic trawl pollock fishery by checking observer reports, landings documents, or vessel logbooks.

Response: NMFS concurs that enforcement of the Kodiak Island closures to trawl gear other than pelagic trawl gear is possible. However, aerial surveillance of areas closed to specified gear types is the most effective and least costly and intrusive means to monitor such closures. NMFS may pursue an FMP amendment in the future that would prohibit the deployment of all trawl gear in the Kodiak Island time/area closures implemented under Amendment 26.

Comment 3: Fisheries enforcement would be enhanced if the time/area closures implemented under Amendment 26 applied to all trawl operations. Allowing only pelagic trawls in the closed areas renders aerial enforcement ineffective. As a result, enforcement of these closures will continue to require air/sea coordination to board and verify whether pelagic or non-pelagic trawl gear activity is occurring. The U.S. Coast Guard does not object to the regulations implementing Amendment 26 because they continue current practices and minimize impacts on pelagic trawl fisheries in the Kodiak Island area.

Response: NMFS notes this comment. Also, see response to Comment 2.

Final Rule

For the reasons set forth above, the final rule maintains paragraphs (d) (1) and (2) of 50 CFR 672.24 but removes paragraphs (d) (3) and (4).

Classification

The Assistant Administrator for Fisheries, NOAA (Assistant Administrator), has determined that this action is necessary for conservation and management of the groundfish fishery in the Gulf of Alaska and that it is consistent with the Magnuson Act and other applicable laws.

This final rule deletes a more restrictive definition for a gear exemption from regulatory time/area closures around Kodiak Island. As a substantive rule that relieves a restriction, under 5 U.S.C. 553(d)(1) it can and is being made effective without a 30-day delay in effective date.

The Council prepared an EA for this rule and the Assistant Administrator concluded that no significant impact on the environment would result from its implementation. The public may obtain a copy of the EA (see ADDRESSES).

The Assistant Administrator determined that this rule is not a major rule requiring a regulatory impact analysis under E.O. 12291. This determination is based on the socioeconomic impact discussed in the EA/RIR prepared by the Council.

NMFS has determined that this rule will be implemented in a manner that is consistent to the maximum extent practicable with the approved coastal zone management program of the State of Alaska. This determination has been submitted for review by the responsible State agency under section 307 of the Coastal Zone Management Act. The State agency declined to comment on the consistency determination within the statutory time period and consistency is inferred.

This rule does not contain policies with federalism implications sufficient to warrant preparation of a federalism assessment under E.O. 12612, and does not contain a collection-of-information requirement for the purposes of the Paperwork Reduction Act.

List of Subjects in 50 CFR Part 672

Fisheries, Reporting and recordkeeping requirements.

Dated: December 30, 1992.

Samuel W. McKeen,

Acting Assistant Administrator for Fisheries, National Marine Fisheries Service.

For the reasons set out in the preamble, 50 CFR part 672 is amended as follows:

PART 672—GROUNDFISH OF THE GULF OF ALASKA

1. The authority citation for 50 CFR part 672 continues to read as follows:

Authority: 16 U.S.C. 1801 *et seq.*

§ 672.24 [Amended]

2. In § 672.24, paragraphs (d)(3) and (d)(4) are removed.

BILLING CODE 3510–22–M

---

50 CFR Parts 672 and 675

[Docket No. 920531–2221]

Groundfish of the Gulf of Alaska; Groundfish Fishery of the Bering Sea and Aleutian Islands Area

AGENCY: National Marine Fisheries Service (NMFS), NOAA, Commerce.

ACTION: Pacific halibut and red king crab bycatch rate standards; request for comments.

SUMMARY: NMFS announces Pacific halibut and red king crab bycatch rate standards for the first half of 1993. Publication of these bycatch rate standards and the schedule for the 1993 fishing months is necessary for purposes of the vessel incentive program. This action is necessary to implement the bycatch rate standards under this program that must be met by individual trawl vessel operators who participate in the groundfish fisheries. The intent of this action is to reduce prohibited species bycatch rates and promote conservation of groundfish and other fishery resources.

DATES: Effective 12:01 a.m., Alaska local time (A.l.t.), January 20, 1993, through 12 midnight, A.l.t., June 30, 1993. Comments on this action must be received at the following address no later than 4:30 p.m., A.l.t., January 19, 1993.

ADDRESSES: Comments should be mailed to Ronald J. Berg, Chief, Fisheries Management Division, NMFS, P.O. Box 21668, Juneau, Alaska 99802–1668, Attn: Lori Gravel, or be delivered to 9109 Mendenhall Mall Road, Federal Building Annex, Suite 6, Juneau, Alaska.

FOR FURTHER INFORMATION CONTACT: Susan J. Salveson, Fisheries Management Division, Alaska Region, NMFS, 907–586–7228.

SUPPLEMENTARY INFORMATION: The domestic and foreign groundfish fisheries in the exclusive economic zone of the Bering Sea and Aleutian Islands Area (BSAI) and Gulf of Alaska (GOA) are managed by the Secretary of Commerce (Secretary) according to the Fishery Management Plan (FMP) for the Groundfish Fishery of the BSAI and the FMP for Groundfish of the GOA. The FMPs were prepared by the North Pacific Fishery Management Council (Council) under the authority of the Magnuson Fishery Conservation and Management Act (Magnuson Act). The FMPs are implemented by regulations for the foreign fishery at 50 CFR part 611 and for the U.S. fishery at 50 CFR parts 672 and 675. General regulations

that also pertain to the U.S. fishery appear at 50 CFR part 620.

Regulations at §§ 672.26 and 675.26 implement a vessel incentive program to reduce halibut and red king crab bycatch rates in the groundfish trawl fisheries. The vessel incentive program was expanded to include all GOA and BSAI groundfish trawl fisheries under a final rule effective January 20, 1993 (57 FR 43926, September 23, 1992). Under the expanded incentive program, operators of trawl vessels must comply with Pacific halibut bycatch rate standards specified for the BSAI and GOA midwater pollock and "other trawl" fisheries, and the BSAI yellowfin sole and "bottom pollock" fisheries. Vessel operators must also comply with red king crab bycatch standards specified for the BSAI yellowfin sole and "other trawl" fisheries in Bycatch Limitation Zone 1 (defined at § 675.2). The fisheries included under the incentive program are defined in regulations at §§ 672.26(b) and 675.26(b).

Regulations at §§ 672.26(c) and 675.26(c) require that halibut and red king crab bycatch rate standards for each fishery monitored under the incentive program be published in the Federal Register. Any vessel operator whose monthly bycatch rate exceeds the bycatch rate standard is in violation of the regulations implementing the incentive program. The standards are in effect for specified seasons within the 6-month periods of January 1 through June 30, and July 1 through December 31. Given that the amended vessel incentive program becomes effective January 20, 1993, and the GOA and BSAI fisheries are closed to trawling until that date (§§ 672.23(e) and 675.23(d), respectively), NMFS is implementing bycatch rate standards for the first half of 1993 effective from January 20, 1993, through June 30, 1993.

At its December 8–13, 1992 meeting, the Council reviewed updated analyses comparing 1991 and 1992 bycatch rates experienced by vessels participating in the fisheries under the incentive program. Based on this and other information presented below, the Council recommended halibut and red king crab bycatch rate standards for the first half of 1993. These standards are set forth in Table 1. As required by §§ 672.26(c) and 675.26(c), the Council's recommended bycatch rate standards for January through June are based on the following information:

(A) Previous years' average observed bycatch rates;

(B) Immediately preceding season's average observed bycatch rates;

(C) The bycatch allowances and associated fishery closures specified under §§ 672.20(f) and 675.21;

(D) Anticipated groundfish harvests;

(E) Anticipated seasonal distribution of fishing effort for groundfish; and

(F) Other information and criteria deemed relevant by the Regional Director.

Bycatch Rate Standards for Pacific Halibut

The Council's Pacific halibut bycatch rate standards for the BSAI and GOA trawl fisheries are based largely on anticipated seasonal fishing effort for groundfish species and historic halibut bycatch rates observed in specified trawl fisheries. Council deliberations on seasonal bycatch rate standards recognized that the 1993 trawl fisheries do not start until January 20 and that the BSAI yellowfin sole fishery is further delayed until May 1 under regulations at § 675.23(c).

The recommended halibut bycatch rate standards for the BSAI yellowfin sole, "bottom pollock," and "other trawl" fisheries approximate the average rates observed on trawl vessels participating in these fisheries during the past 2 years.

The halibut bycatch rate standard recommended for the BSAI and GOA midwater pollock fisheries (1 kilogram (kg) halibut/metric ton (mt) of groundfish) is higher than the bycatch rates normally experienced by vessels participating in these fisheries. The recommended standard is intended to encourage vessel operators to maintain off-bottom trawl operations during their participation in the midwater pollock fisheries. Vessel operators/owners who exceed the halibut bycatch rate standard are subject to prosecution under the incentive program.

The recommended standard for the BSAI "bottom pollock" fishery during the first quarter of 1993 (7.5 kg halibut/mt of groundfish) is set at a level that approximates the average halibut bycatch rate experienced by vessels participating in the "bottom pollock" fishery during the first quarter of 1992 (7.58 kg halibut/mt of groundfish. The recommended bycatch rate standard for the first quarter of 1993 is higher than the standard recommended for the second quarter (5.0 kg halibut/mt of groundfish). The Council anticipates that fishing effort for pollock by the inshore and offshore components will occur during the first quarter of 1993 and that directed fishing allowances specified for the pollock "A" season will be reached before the end of the "A" season (April 15). Directed fishing for pollock by vessels participating in the inshore and offshore component fisheries is prohibited from the end of the pollock "A" season until the beginning of the pollock "B" season (June 1). During its December meeting, the Council took action to delay the opening of the pollock "B" season until August 15. If the Secretary approves the "B" season delay, it could be implemented in 1993. Vessels fishing under the Community Development Quota (CDQ) program (50 CFR § 675.27) could participate in a directed fishery for pollock between the "A" and "B" seasons, subject to other provisions governing the groundfish fisheries.

The 5.0 kg halibut/mt of groundfish bycatch rate standard recommended by the Council for the second quarter of 1993 approximates the average halibut bycatch rate experienced by vessels participating in the "bottom pollock" fishery during the second quarter of 1992 (4.3 kg halibut/mt of groundfish). This bycatch rate standard is intended to accommodate any CDQ fishery that may occur after the first quarter of 1993. This standard also would apply to the inshore and offshore pollock fisheries during the month of June should the Secretary not approve the Council's proposed delay of the pollock "B" season.

The Council recommended a 50 Kg halibut/mt of groundfish bycatch rate standard for the GOA "other trawl" fishery. This standard is unchanged from 1992 and is based on Council intent to simplify the GOA incentive program by specifying a single bycatch rate standard for the fisheries under the incentive program, yet maintain the Council's objective of reducing halibut bycatch rates in the GOA trawl fisheries. Observer data collected from the 1991 GOA trawl fisheries (excluding the midwater pollock fishery) show first and second quarter halibut bycatch rates of 24 and 66 kg halibut/mt of groundfish, respectively. First and second quarter rates from 1992 were lower at 20 and 22 kg/mt of groundfish, respectively. In spite of the apparent reduction in average bycatch rates from 1991 to 1992, the Council determined that a halibut bycatch rate standard of 50 kg halibut/mt of groundfish would continue to provide an incentive to vessel operators to reduce halibut bycatch rates while participating in the GOA trawl fisheries.

Bycatch Rate Standard for Red King Crab

The Council's recommended red king crab bycatch rate standard for the yellowfin sole and "other trawl" fisheries in Zone 1 of the Bering Sea subarea is 2.5 crab/mt of groundfish

during the first half of 1993. This standard is the same as that recommended for 1992.

Little fishing effort for flatfish occurred in Zone 1 during 1991 because commercial concentrations of yellowfin sole normally occur north of this area by the time the fishery opens May 1. As such, limited observer data exist for the 1991 and 1992 yellowfin sole fishery in Zone 1. These data indicate average quarterly red king crab bycatch rates between 1.3 and 1.4 crab/mt of groundfish. During this same period, vessels participating in the "other trawl" fishery experienced average red king crab bycatch rates ranging between 0.8 and 1.7 crab/mt of groundfish. During 1991 and 1992, some fishermen experienced relatively high bycatch rates of halibut north of Zone 1 and expressed a desire to explore fishing grounds in Zone 1 that may have lower halibut bycatch rates. Fishermen were reluctant to fish in Zone 1, however, because of possibly exceeding the red king crab bycatch rate standard. The total bycatch of red king crab by vessels participating in the 1992 trawl fisheries is estimated at 111,325 crab, or about 56 percent of the 200,000 crab bycatch limit established for the trawl fisheries in Zone 1. Recognizing that the red king crab bycatch limit will restrict bycatch amounts to specified levels, the Council maintained the 2.5 red king crab/mt of groundfish bycatch rate standard to support those fishermen who actively pursue alternative fishing grounds in an attempt to reduce halibut bycatch rates.

The Regional Director has determined that Council recommendations for bycatch rate standards are appropriately based on the information and considerations necessary for such determinations under §§ 672.26(c) and 675.26(c). Therefore, the Regional Director concurs in the Council's determinations and recommendations for halibut and red king crab bycatch rate standards for the first half of 1993 as set forth in Table 1. These bycatch rate standards may be revised and published in the **Federal Register** when deemed appropriate by the Regional Director pending his consideration of the information set forth at §§ 672.26(c) and 675.26(c).

Fishing Months

As required in regulations at §§ 672.26(a)(2)(iii) and 675.26(a)(2)(iii), the 1993 fishing months are specified as the following periods for purposes of calculating vessel bycatch rates under the incentive program:

Month 1: January 1 through January 30;
Month 2: January 31 through February 27;
Month 3: February 28 through April 3;
Month 4: April 4 through May 1;
Month 5: May 2 through May 29;
Month 6: May 30 through July 3;
Month 7: July 4 through July 31;
Month 8: August 1 through August 28;
Month 9: August 29 through October 2;
Month 10: October 3 through October 30;
Month 11: October 31 through November 27; and
Month 12: November 28 through December 31.

Classification

This action is taken under 50 CFR 672.26 and 675.26 and complies with E.O. 12291.

Information upon which the recommended bycatch rate standards are based was not available prior to the Council's December 1992 meeting. These standards must be effective by the start of the 1993 trawl season on January 20, to avoid a lapse in vessel accountability under the vessel incentive program. Without this accountability, prohibited species bycatch rates could increase in the groundfish trawl fisheries, prohibited species bycatch allowances could be reached sooner, specified groundfish trawl fisheries could be closed prematurely, and owners and operators of groundfish trawl vessels could incur additional foregone revenues. Therefore, the Assistant Administrator for Fisheries, NOAA, finds for good cause that it is impractical and contrary to the public interest to extend prior notice and comment on this notice beyond the start of the 1993 trawl season, or to delay its effective date.

Proposed Rules

Federal Register
Vol. 58, No. 3
Wednesday, January 6, 1993

This section of the FEDERAL REGISTER contains notices to the public of the proposed issuance of rules and regulations. The purpose of these notices is to give interested persons an opportunity to participate in the rule making prior to the adoption of the final rules.

DEPARTMENT OF AGRICULTURE

Farmers Home Administration

7 CFR Part 1944

RIN 0575–AB16

Section 502 Rural Housing Loan Policies, Procedures, and Authorizations

AGENCY: Farmers Home Administration, USDA.

ACTION: Proposed rule.

SUMMARY: The Farmers Home Administration (FmHA) proposes to amend its Single Family Rural Housing loan making regulation. The following actions are taken: The definition of income is being revised pursuant to the Omnibus Budget Reconciliation Act of 1990, Public Law 101–508, which excludes "any earned income tax credit to the extent it exceeds tax liability" from being counted in the annual income; The interests of individual Indians in trust or restricted lands and payments made from the Agent Orange Settlement Fund or any other exempted Federal statutes cannot be used for the purposes of determining eligibility for an FmHA loan, nor can they be considered in determining the amount of interest credit assistance for which a borrower is eligible; Exclusion from the definition of annual income of pay of a member of the Armed Forces stationed in the Operation Desert Storm Combat Zone; FmHA will no longer post the selected Rural Housing applicants' names on the FmHA County Office's bulletin boards; FmHA will require applicants/borrowers to submit Federal income tax returns as part of a completed loan application; and the interest credit regulation is updated and discrepancies with previously published regulations are removed.

DATES: Comments must be received on or before March 5, 1993.

ADDRESSES: Submit written comments, in duplicate, to the Office of the Chief, Regulations Analysis and Control Branch, Farmers Home Administration, U.S. Department of Agriculture, room 6348, South Agriculture Building, 14th and Independence SW., Washington, DC 20250. All written comments will be available for public inspection during regular working hours at the above address.

FOR FURTHER INFORMATION CONTACT: Gloria L. Denson, Loan Specialist, Farmers Home Administration, USDA, room 5334–S, South Agriculture Building, 14th and Independence SW., Washington, DC 20250, Telephone (202) 720–1487.

SUPPLEMENTARY INFORMATION:

Classification

These actions have been reviewed under USDA procedures established in Departmental Regulation 1512–1 which implements Executive Order 12291, and has been determined to be a nonmajor because there is no substantial change from practices under existing rules that would have an annual effect on the economy of $100 million or more. There is no major increase in cost or prices for consumers, individual industries, Federal, State, or local Government agencies, or geographic regions, or significant adverse effects on competition, employment, productivity, innovation, or in the ability of United States based enterprises to compete with foreign-based enterprises in domestic or export markets. These actions are not expected to substantially affect budget outlay or affect more than one Agency or to be controversial. The net result is expected to provide better service to rural residents.

Environmental Impact Statement

This document has been reviewed in accordance with 7 CFR part 1940, subpart G, Environmental Program. It is the determination of FmHA that the proposed action does not constitute a major Federal action significantly affecting the quality of the human environment and in accordance with the National Policy Act of 1949, Public Law 91–90, an Environmental Impact Statement is not required.

Intergovernmental Consultation

For the reason set forth in the final rule related notice to 7 CFR part 3015, subpart V, 48 FR 29115, June 24, 1983, this program/activity is excluded from the scope of Executive Order 12372 which requires intergovernmental consultation with State and local officials.

Program Affected

This program is listed in the catalog of Federal Assistance under 10.410, Low-Income Housing Loans.

Regulatory Flexibility Act

This final rule has been reviewed with respect to the Regulatory Flexibility Act (5 U.S.C. 601–612). The undersigned has determined that this action will not have a significant economic impact on a substantial number of small entities since this rulemaking action does not involve a new or expanded program.

Background/Discussion

FmHA's existing regulations require any earned income tax credit to the extent it exceeds income tax liability to be included in the applicant/borrower's annual income. The Omnibus Budget Reconciliation Act of 1990, Public Law 101–508, excluded the earned income tax credit refund from being considered as income for purposes of FmHA housing programs. This exclusion was effective January 1, 1991. Therefore, the current regulations are being amended to exclude this requirement from the annual income definition.

FmHA is revising its regulations defining income for housing programs to clarify that the interests of individual Indians in trust or restricted lands shall not be considered a resource in determining eligibility for assistance. This change is consistent with 25 U.S.C. 1408.

Revisions are being made to FmHA regulations to exclude payments from the Agent Orange Settlement Fund or any other fund established pursuant to the settlement in the In re Agent Orange product liability litigation as means or resources for purposes of determining eligibility for an FmHA housing loan or interest credit. These changes are required by Public Law 101–201.

Section 501(b)(5) of the Housing Act of 1949 provides that for the purposes of the Housing Act of 1949 the "terms 'income' and 'adjusted income' have the meanings given by sections 3(b)(4) and 3(b)(5), respectively, of the United States Housing Act of 1937." Section 3(b)(4) of the United States Housing Act of 1937, 42 U.S.C. 1437a(b)(4), provides that the "term 'income' means income

from all sources of each member of the household, as determined in accordance with criteria prescribed by the Secretary of [of HUD], in consultation with the Secretary of Agriculture, except that any amounts not actually received by the family may not be considered as income under this paragraph." On January 29, 1991, the HUD Assistant Secretary for Public and Assisted Housing issued Notice H 91–11 which, among other things, waives HUD regulations which required annual income to include "all regular pay, special pay and allowances of a member of the Armed Forces." Thus, for the duration of Operation Desert Storm HUD's definition of annual income does not include military pay of military personnel stationed in the combat zone as defined in Presidential Executive Order 12744 (January 21, 1991). This revision in the definition of annual income is added to the FmHA definition of income for housing programs.

Current regulations require the County Supervisor to post on the County Office bulletin board after each selection period a list of the names of those applicants who have been selected and notified of the processing of their application. Based on recent Supreme Court decisions under the Freedom of Information Act (FOIA), FmHA is deleting this public posting requirement.

Current FmHA regulations do not require the County Supervisor to have the applicants submit, during the application process, audited and/or certified financial statements and income tax returns. The regulations are being revised to require the FmHA County Supervisor to review the Single Family Housing applicants' audited and/or certified financial statements and/or most recent Federal income tax returns as a part of the application process.

In an earlier rule change, FmHA implemented a provision of the Housing and Community Development Act of 1987 that provided for borrowers receiving interest credit assistance to continue their interest credit subsidies even though their incomes exceeded the moderate income level. To eliminate inconsistencies, the Agency proposes to revise the limitation on new interest credits for existing loans to allow borrowers with income not exceeding moderate to receive interest credit. In the past, a borrower had to have a low income to initially receive interest credit, although interest credit could continue to the borrower when the adjusted family income exceeded the moderate income limit. The change will allow existing borrowers who have moderate incomes to qualify to receive interest credit.

A change in the effective period of the Interest Credit Agreement is proposed in situations where the borrower is unemployed. Currently, the Interest Credit Agreement is processed for 12 months based on the borrower's present verified income. When a borrower receives unemployment income, there is potential for confusion about how to estimate the borrower's income for the next 12 months. The Agency proposes to extend the Interest Credit Agreement only for the known period of unemployment benefits or six months. The borrower's income will be reviewed prior to the end of this period and the interest credit agreement revised accordingly.

A change is being made to ensure that the Agency handles a reduction in income consistently between the servicing regulations (7 CFR part 1951 subpart G) and the credit regulations. Currently, married borrowers must be separated for a period of at least six months before additional interest credit assistance can be considered. An income reduction of at least 30 percent within three months of the anniversary date was not considered for additional interest credit assistance until the anniversary date. FmHA servicing regulations permit an account to be accelerated when it is three monthly payments delinquent provided the account has been serviced. Thus it was possible to accelerate a borrower's account before reaching the prescribed eligibility for additional interest credit assistance. Revisions have been made to correct this problem and to allow consideration of interest credit benefits at the end of three months instead of six months. In addition, borrowers may qualify for a reduction in payments at any time, provided the verified change in income results in a payment reduction of at least 15 percent.

The Agency proposes to remove the provision for cancelling interest credit benefits to a family who has improved its property beyond what is considered to be modest for the area. This provision was untenable because the lack of interest credit would make many of these families unable to afford the costs of home ownership.

The Agency proposes to add a District Director review of a representative sample of interest credit agreements in each County Office. The incomes reported on these agreements will be verified with the State Employment Agency, or similar agency, to ensure that all family income has been counted.

Paperwork Reduction Act

The collection of information requirements contained in this regulation have been submitted to the Office of Management and Budget for review under section 3504(h) of the Paperwork Reduction Act of 1980. Public reporting burden for this collection of information is estimated to vary from 15 minutes to 1.5 hours per response, with an average of 30 minutes per response including time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden, 404–W, Washington, DC 20250; and to the Office of Management and Budget, Attention: Desk Officer for the Farmers Home Administration, Washington, DC 20503.

Civil Justice Reform

The proposed regulation has been reviewed in light of Executive Order (EO) 12778 and meets the applicable standards provided in section 2(a) and (2)(b)(2) of that Order. Provisions within this part which are inconsistent with state law are controlling. All administrative remedies pursuant to 7 CFR part 1900 subpart B must be exhausted prior to filing suit.

Regulatory Reform: Less Burdensome or More Efficient Alternatives

The Department of Agriculture is committed to carrying out its statutory and regulatory mandates in a manner that best serves the public interest. Therefore, where legal discretion permits, the Department actively seeks to promulgate regulations that promote economic growth, create jobs, are minimally burdensome and are easy for the public to understand, use or comply with. In short, the Department is committed to issuing regulations that maximize net benefits to society and minimize costs imposed by those regulations. This principle is articulated in President Bush's January 28, 1992 memorandum to agency heads, and in Executive Orders 12291 and 12498. The Department applies this principle to the full extent possible, consistent with law.

The Department has developed and reviewed this regulatory proposal in accordance with these principles. Nonetheless, the Department believes that public input from all interested persons can be invaluable to ensuring that the final regulatory product is

minimally burdensome and maximally efficient. Therefore, the Department specifically seeks comments and suggestions from the public regarding any less burdensome or more efficient alternative that would accomplish the purposes described in the proposal. Comments suggesting less burdensome or more efficient alternatives should be addressed to the agency as provided in this Notice.

List of Subjects in 7 CFR Part 1944

Home improvement, Loan programs—Housing and community development, Low and moderate income housing—Rental, Mobile homes, Mortgages, Subsidies.

Therefore, as proposed, part 1944, chapter XVIII, title 7, Code of Federal Regulations, is amended as follows:

PART 1944—HOUSING

1. The authority citation for part 1944 continues to read as follows:

Authority: 42 U.S.C. 1480; 5 U.S.C. 301; 7 CFR 2.23 and 2.70.

Subpart A—Section 502 Rural Housing Loan Policies, Procedures, and Authorizations

2. Section 1944.5 is amended by removing paragraph (d)(8) and redesignating current paragraphs (d)(9), (10), and (11), as paragraphs (d)(8), (9), and (10), respectively; and by revising paragraphs (e)(8), (e)(12), and (e)(17) to read as follows:

§ 1944.5 Annual income.

* * * * *

(e) * * *

(8) The hazard duty pay to a service person applicant/borrower or spouse away from home and exposed to hostile fire. The imminent danger duty pay to a service person applicant/borrower or spouse away from home and exposed to hostile fire. Amounts of imminent danger pay for Military personnel stationed in the Combat Zone are excluded from annual income effective August 2, 1990. Any military pay received by persons serving in the Combat Zone received on or after January 17, 1991 is excluded from annual income. The Combat Zone, as defined by the Presidential Executive Order 12744 dated January 21, 1991, consists of the Persian Gulf, the Red Sea, the Gulf of Oman, that portion of the Arabian Sea that lies north of 10 degrees north latitude and west of 68 degrees east longitude, the Gulf of Aden, the total land areas of Iraq, Kuwait, Saudi Arabia, Oman, Bahrain, Qatar, and the United Arab Emirates. Immediately upon notification by the family or based on information from a knowledgeable source that a member of the household is or was serving in the Combat Zone, the County Supervisor shall redetermine the household income retroactive to January 17, 1991, and adjust the borrower's interest credit accordingly.

* * * * *

(12) Any earned income tax credit to the extent it exceeds income tax liability will not be counted as part of annual income, but will remain part of the applicant's income for purposes of repayment ability.

* * * * *

(17) Payments received from the Agent Orange Settlement Fund, income from interests of individual Indians in trust or restricted land, and any funds which a Federal statute specifies must not be used as the basis for denying or reducing Federal financial assistance or benefits to which the recipient would otherwise be entitled.

3. Section 1944.26 is amended by removing paragraph (c) (2) and redesignating paragraphs (c) (3), (4), and (5) as (c) (2), and (3) and (4), respectively; and by adding a paragraph (a) (7) to read as follows:

§ 1994.26 Application processing.

* * * * *

(a) * * *

(7) The applicant must submit a certified financial statement and/or a copy of the applicant's most recently filed Federal income return as part of the completed loan application. The applicant will be advised of this requirement during the application interview.

* * * * *

4. Section 1944.34 is revised to read as follows:

§ 1944.34 Interest credit.

(a) *General.* It is the policy of FmHA to grant interest credit on loans to qualified borrowers to assist them in obtaining and retaining decent, safe, and sanitary dwellings and related facilities. When FmHA contracts out servicing, all actions assigned to the County Supervisor may be performed by the contractor, except approval or cancellation of interest credit.

(b) *Definition.*—(1) *Annual payment borrowers.* Borrowers who signed promissory notes providing for annual payments, including borrowers converted to monthly payments through the use of Form 1951–34, Direct Plan Change.

(2) *Monthly payment borrowers.* Borrowers who signed promissory notes providing for monthly payments.

(3) *Review period.* The review period for an annual payment borrower will be the months of October and November. The review period for a monthly payment borrower will be the second and third months prior to the scheduled expiration date of the borrower's current Interest Credit Agreement.

(4) *Real estate taxes.* Real estate taxes for interest credit purposes means the amount of real estate taxes and assessments that will actually be due and payable on the dwelling and the dwelling site during the interest credit period, reduced by the amount of any tax exemption available to the borrower, regardless of whether such exemption is actually claimed. Tax exemptions may include such things as homestead exemptions, special exemptions for low-income families, senior citizens, veterans, and others.

(c) *Approval authority.* Those FmHA officials who are authorized to approve Section 502 loans are also authorized to approve the Interest Credit Agreement.

(d) *Amount of interest credit.* (1) Loans other than FmHA loans qualified to be considered in the interest credit calculation include only those loans made for authorized Section 502 RH purposes and which are a lien against the FmHA security by virtue of a prior mortgage. Except as provided in paragraph (d)(2) of this section, the amount of interest credit granted will be the lesser of:

(i) The difference between 20 percent of the borrower's adjusted annual income and the sum of the annual installments due at the note interest rate on qualified loans plus the cost of real estate taxes and insurance, or

(ii) The difference between the annual installment due on the FmHA promissory notes eligible for interest credit and the amount the borrower would pay if the loan(s) was amortized at an interest rate of 1 percent.

(2) For repair and rehabilitation loans which meet the requirements of paragraph (f)(6) of this section, interest credit will be granted in an amount to achieve the following effective interest rates:

(i) For borrowers whose adjusted annual income is not more than $5,000, interest credit will be calculated using the amortization factor for 1 percent.

(ii) For borrowers whose adjusted annual income is more than $5,000 but not more than $7,000, interest credit will be calculated using the amortization factor for 2 percent.

(iii) For borrowers whose adjusted annual income is more than $7,000 but not more than $10,000, interest credit will be calculated using the amortization factor for 3 percent.

(3) Borrowers qualifying for interest credit assistance under both paragraphs (d) (1) and (2) of this section will be granted only the one type of interest credit assistance that is most beneficial to them. Interest credit on initial and subsequent loans will always be the same type. There is no provision for switching from one type of interest credit to the other.

(e) *Recapture.* At the applicant interview, FmHA will advise all Section 502 RH applicants that interest credit is subject to recapture.

(f) *Eligibility.* To be eligible for interest credit, a borrower must qualify for a Section 502 loan, must personally occupy the dwelling, and must meet the following additional requirements:

(1) *Initial loans including credit sales.* Interest credit may be granted at loan closing if:

(i) The borrower's adjusted annual income at time of loan approval did not exceed the applicable low-income limit in Exhibit C of this subpart. (Available in any FmHA office).

(ii) The borrower's net family assets do not exceed $7,500, (maximum as defined in § 1944.2(n) of this subpart) (net family assets of $10,000 will be allowed for an elderly family as defined in § 1944.2(d) of this subpart) unless an exception is authorized. The calculation of net family assets will exclude the value of the dwelling and a minimum adequate dwelling site, cash on hand which will be used to reduce the amount of the loan, and household goods and personal automobile(s) and the debts against them.

(iii) The term of the loan will be determined in accordance with § 1944.25 of this subpart. Interest credit will not be granted on loans with a term of less than 25 years, except as provided in paragraphs (f) (4) and (6) of this section.

(iv) The loan was approved on or after August 1, 1968, and

(v) The amount of interest credit will be $5 or more per month or $60 or more annually.

(2) *Subsequent loans.* Interest credit may be granted on subsequent loans which meet the requirements of paragraph (f)(1) of this section. If interest credit is presently being granted on the initial loan and the borrower's adjusted income does not exceed the moderate-income limit, it may also be granted on the subsequent loan if the term of the subsequent loan is 25 years or more.

(3) *Assumptions.* Interest credit may be granted to a borrower assuming a RH loan provided the assuming party(ies) qualifies according to paragraph (f)(1) of this section.

(4) *Reamortization.* Interest credit may be granted on loans made as low- and moderate-income loans after reamortization:

(i) If the loan was eligible for interest credit prior to reamortization, interest credit may continue to be granted regardless of the remaining reamortization period.

(ii) If the loan was not eligible for interest credit prior to reamortization, the reamortized term of the loan must be 25 or more years and all other conditions of paragraph (f)(1) of this section must be met.

(5) *Existing loans.* Interest credit may be granted at any time after loan closing if:

(i) the requirements of paragraphs (f)(1) (ii), (iii), and (v) of this section are met;

(ii) the loan was approved as a "low or moderate" Section 502 loan on or after August 1, 1968;

(iii) the borrower's adjusted annual income does not exceed the moderate income limit in Exhibit C of this subpart (available in any FmHA Office).

(iv) Due to a change in circumstances, the borrower requests interest credit, or FmHA determines that interest credit is needed to enable the borrower to repay the loan. In the case of co-borrowers, when one co-borrower has left the dwelling due to domestic discord, interest credit based on the remaining co-borrower's income may be extended to the remaining co-borrower if:

(A) the remaining co-borrower is occupying the dwelling, owns a legal interest in the property, and is liable for the debt;

(B) legal papers have been filed with the appropriate court to commence divorce or legal separation proceedings, or one co-borrower has not been living in the dwelling for at least three months. Interest credit will not be granted if separation is due only to work assignment or military order; and

(C) The remaining co-borrower is informed and agrees that should the co-borrower return to live in the dwelling, that co-borrower's income will then be counted toward annual income and interest credit may be reduced or cancelled.

(6) *Repair and rehabilitation loans.* Interest credit may be granted on Section 502 RH loans made to repair or rehabilitate a dwelling already owned by the applicant provided the following conditions are met:

(i) The initial interest will be granted at the time of loan closing and the loan will be secured by a real estate mortgage;

(ii) The dwelling is, or will be, occupied by an eligible borrower after the loan is made;

(iii) The amount of the loan will not exceed $10,000, or be amortized for not more than 25 years;

(iv) The applicant's adjusted annual income does not exceed $10,000;

(v) The repairs will be made to bring a substandard dwelling up to the standards outlined in Section 1944.16(j); and

(vi) The net family asset requirements in paragraph (f)(1)(ii) of this section are met.

(g) *Processing interest credit*—(1) *General.* The amount of interest credit for which a borrower may be eligible will be determined by use of Form FmHA 1944–6 or Form 1944–A6, "Interest Credit Agreement," as outlined in paragraph (d) of this section.

(i) *Determination of Income.* The County Supervisor is responsible for determining the borrower's annual and adjusted annual income as defined in § 1944.2, paragraphs (b) and (c) respectively, of this subpart. A borrower interview will be conducted in all cases for granting initial interest credit. Form FmHA 1910–5 will be used to verify the earning from employment of all persons whose income is included in "Annual Income."

(ii) *Effective period.* Interest Credit Agreements on loans made to monthly payment borrowers will be for a 12-month period. For annual payment borrowers and annual converted to monthly borrowers, the agreements will be in effect until January 1 after the effective date. For an unemployed borrower receiving unemployment benefits, the agreement will be effective for the period during which the borrower will receive unemployment benefits, or if the period if unknown, no longer than 6 months. The expiration date will be established by FmHA.

(iii) *Partial year interest credit.* For an annual payment borrower with an initial installment less than a regular installment, and who will receive less than a full year of interest credit assistance, the interest credit granted will be pro rata portion calculated on the number of months left in the current calendar year, including the month in which the loan is closed.

(iv) *Advance from the RHIF.* The repayment schedule for advances made from the Rural Housing Insurance Fund will be computed at the interest rate shown on the promissory note.

(v) *Preparation of the transaction record.* For borrowers receiving interest credit in Western Pacific Territory field offices, the following changes will be shown on Form 451–26, Transaction

Record, when prepared by the Finance Office:

(A) *Interest rate field.* The interest rate field of the form will continue to show the interest rate on the note. The Finance Office will compute the effective interest rate charged the borrower based on the amount of interest credit granted. The computed rate, rounded to the nearest ⅛ of a percent, will be shown as a footnote on the form as "Interest Rate reduced to ____%." Subsequent transactions will be applied to the loan by the Finance Office at the reduced interest rate until such time as renewal, change, or cancellation occurs.

(B) *Daily interest accrual field.* The daily interest accrual will be shown at the reduced interest rate and the interest will accrue at the same interest rate until such time as the interest credit is renewed, changed, or cancelled.

(C) *Application of credit field.* The initial transaction record form will not have an entry in the "Application of Credit" field. The Interest Credit Transaction Code for this method of processing interest credit will be 4 Z.

(D) Payment status field. The payment status field will not reflect the dollar amount of the interest credit granted. No entry will be made for monthly payment borrowers.

(E) Minimum amount due by date show field. For annual payment borrowers, the amount of the installment, reduced by the amount of interest credit granted, will be shown. For monthly payment borrowers the word "monthly" will be entered in the space provided.

(2) *Initial and subsequent loans*—(i) *County Office action.* The County Supervisor will:

(A) Determine the borrower's adjusted annual income and document the calculations in the case file running record.

(B) Enter on Form FmHA 1940–1 the adjusted annual income, the estimated real estate taxes that will become due and payable during the first and second years of the agreement, and the amount of the annual property insurance premium for the dwelling.

(C) For initial loans approved with interest credit and closed under the multiple advance feature of the loan disbursement system outlined in Subpart A of Part 1902 of this Chapter, further review of the borrower's financial status is not required unless the Interest Credit Agreement will be approved more than 90 days after the last "Verification of Employment" or there is evidence which indicates the borrower's financial status has changed significantly. If prior to the approval of the Interest Credit Agreement, the County Supervisor finds that the adjusted income has increased, interest credit will be granted on the basis of the borrower's new circumstances.

(D) Complete a corrected Interest Credit Agreement when the loan is closed or at the amortization effective date if the borrower's circumstances have changed do that the amount of interest credit would be increased or decreased by at least $5 monthly or $60 annually.

(3) *Reamortization, credit sales and transfers.* Interest credit to a borrower whose loan(s) is being reamortized, or a borrower who assumes an RH loan or purchases property from inventory will be calculated by the County Office on Form FmHA 1944–6.

(4) *Existing loans.* Interest credit granted in accordance with paragraph (f)(5) of this section can be processed at any time in the same manner as interest credit on initial loans, except that the County Office will complete Form FmHA 1944–6 and calculate the amount of interest credit assistance the borrower will receive.

(h) *Interest credit modification*—(1) *Before expiration.* When approving a change in interest credit assistance before the expiration of a current Interest Credit Agreement in accordance with paragraph (i)(3) of this section, FmHA will interview the borrower and determine the borrower's adjusted annual income.

(2) *Correction of Interest Credit Agreement.* When an error by a FmHA employee results in granting at least $5 per month ($60 per year) less interest credit than the borrower was eligible to receive, a corrected agreement will be prepared. The effective date of the corrected agreement will be the same as the agreement in error. Payments made under the previous agreement will be reapplied according to the terms of the new Interest Credit Agreement.

(3) *Interest credit renewal.* Pursuant to delegations of procurement authority included in FmHA Instruction 2024–A (available in any FmHA Office), FmHA is authorized to enter into contracts for the processing of interest credit renewals. Contractors will not be given the authority to approve or disapprove Interest Credit Agreements.

(i) *Borrower responsibility.* The interest credit renewal packages are issued annually to determine the borrower's eligibility for interest credit assistance and to verify the earnings or incomes of all persons whose incomes are included in the annual income. Upon receipt of the package, the borrower's responsibility will to give one copy of the Verification of Employment (Form FmHA 1910–5) to the employer or employers of each member of the household who has income to be considered. An envelope will be provided each employer to facilitate the mailing of the form directly to the County Office or to the contractor, if applicable. The borrower will also complete Part II of the interest form, sign the original form and bring the original and all copies to the FmHA or the interest credit contractor. Postage for these envelopes will be provided as set forth in § 1944.26(a)(5) of this subpart.

(ii) *County Office actions.* The County Supervisor, or designee will:

(A) One month prior to the interest credit agreement expiration date, Transaction Code (T/C) IC will become available for a borrower and the county office will access the workfile to enter the required renewal information using Transaction Code T/C IC, Interest Credit Workfile, via the Automated Discrepancy Processing System (ADPS). At this time, the County Office may input the necessary data which will be updated to the borrower's account on the expiration date. The county office should not attempt to change the process code, this will be taken care of systemically.

(B) Conduct an interview with the borrower to review the information on Forms FmHA 1944–A6 and FmHA 1910–5 for completeness and accuracy. The interview should, when possible, be face to face contact. After discussing the interest credit renewal with the borrower, a typewriter should be used to complete actions III and V on the Form FmHA 1944–A6. All amounts should be rounded in accordance with the Forms Manual Insert and shown in dollars only.

(C) Determine the adjusted annual income and document the calculations in the case file running record. After completion and verification of the information on Form FmHA 1944–A6, retain the original in the County Office for use in processing the renewal to the IC workfile and as part of the borrower's official record. Return the last copy to the borrower. Do not return Form 1944–A6, Interest Credit Agreement, for monthly borrowers to the Finance Office.

(D) If the borrower is no longer eligible for interest credit, notify the borrower by using Exhibit B 1 to 7 CFR part 1900, subpart B. The letter must notify the borrower of the right to appeal as outlined in 7 CFR part 1900, subpart B. A new Form FmHA 440–9 will be obtained when needed.

(E) Effective with the processing of interest renewal information to the workfile, annotate on the Form 1944–A6

and the list the name of the employee entering the data, date information entered, and related ADPS block number of T/C IC. FmHA Instruction 2033–A, Exhibit C, provides the program records retention requirements for source/input documents processed to ADPS via the Field office terminal system.

(iii) *Finance Office actions.* The Finance Office will update automated monthly interest credit renewals daily, based upon the effective date. Direct payment coupons will be mailed in time to ensure that borrowers are provided their new payment packet in sufficient time to make their next payment as scheduled.

(iv) *Processing interest credit renewals not received during the interview period.* Interest credit agreements not updated via the Interest Credit Workfile will automatically be canceled as of the expiration date. To ensure continued interest credit, it is imperative that renewals are processed to the workfile before the agreement effective date.

(v) *Renewals not updated before the expiration date.* If a renewal was not updated before the expiration date, perform the following:

(A) Access and verify that the renewal record for the applicable borrower's case number is not on the Automated Discrepancy Processing System (ADPS) recap and resequence screen.

(B) If the renewal is on the ADPS, enter the renewal information.

(C) If the renewal is not on the ADPS, verify that the borrower's interest credit has been canceled by viewing the related on-line history information.

(D) If interest credit was canceled, verify that there is no later activity (transactions) that has processed and process the renewal through the field office terminal system.

(E) If later activity has processed, manuscript and route the renewal transaction to the Finance Office servicing team.

(i) *Eligibility review.* The eligibility reviews of borrowers currently receiving interest credits are based on verified earnings or incomes of all persons whose incomes are included in the annual income. The eligibility of those borrowers will be reviewed as follows:

(1) *Annual review.* The eligibility of borrowers will be reviewed annually during the review period.

(i) If the value of the borrower's net family assets increases above the applicable eligibility limit, interest credit will be renewed unless the increase is sufficient to enable the borrower to graduate to another source of credit.

(ii) Interest credit will not be renewed if the amount of interest credit for which the borrower qualifies is less than $5 monthly or $60 annually.

(2) *Renewal not completed during the review period.* When the borrower's renewal Interest Credit Agreement is not completed during the review period, it will be processed in accordance with § 1944.34(h)(3)(v).

(3) *Change in borrower's circumstances.* FmHA is not responsible for monitoring whether a borrower's income, family size, real estate taxes, or insurance costs have changed after an Interest Credit Agreement is approved. If, however, it becomes known that the borrower's circumstances have changed significantly, FmHA will take action in accordance with the following:

(i) Increased adjusted income outside the regular review period. If FmHA determines that the borrower's adjusted income has increased to the level where the interest credit is less than $5 monthly or $60 annually, the interest credit will be cancelled effective the date FmHA becomes aware of the situation. The borrower will be notified in accordance with paragraph (l) of this section.

(ii) Decreased adjusted income. Changes in interest credit will not be made unless the borrower's payment would be reduced by at least 15 percent.

(iii) FmHA will not count any military pay received by persons serving in the Combat Zone. If such income was counted, the FmHA County Supervisors should process a revised interest credit agreement, if not counting such pay would result in a change in the amount of interest credit. After the County Supervisor becomes aware that a borrower has entered active military duty after the loan is closed, the servicing of the account should be handled under § 1951.317 of Subpart G of Part 1951 of this chapter.

(j) *Unauthorized interest credit.* When it is determined that a borrower has received interest credit to which he/she was not entitled (unauthorized interest credit), the case will be serviced according to Subpart M of Part 1951 of this chapter.

(k) *Cancellation of interest credit agreements*—(1) *Reasons for cancellation.* An existing Interest Credit Agreement will be cancelled whenever:

(i) The borrower does not physically occupy the dwelling as his/her primary residence. Nursing homes and specialized care facilities are considered full time residences. The following may be indicators of non-occupancy:

(A) The borrower does not physically occupy the property more than half of the year

(B) The borrower's children are enrolled in a day school that is not considered within commuting distance of the dwelling

(C) The borrower's primary source of year round employment is not within commuting distance of the dwelling and/or

(D) The borrower routinely stays at another residence.

(ii) The borrower rents, leases, sells or conveys the title to the property.

(iii) The borrower has received improper interest credit as outlined in subpart M of part 1951 of this chapter and a corrected Interest Credit Agreement will not be submitted.

(iv) The borrower has an increase in income as outlined in § 1994.34(i)(3)(i) and is no longer eligible for interest credit.

(v) The security property is acquired by FmHA.

(vi) The borrower provides fraudulent or materially inaccurate financial information in connection with an interest credit application/renewal.

(2) *Effective date of cancellation.* The effective date of cancellation if the borrower has never occupied the property will be the date of loan closing. The effective date of cancellation for paragraphs (k)(1) (i), (ii), (iii), (iv) and (vi) of this section will be the date on which the earliest action occurs which causes the cancellation. If the date cannot be determined, the date on which FmHA became aware of the situation will be used. The effective date of cancellation for paragraph (k)(1)(v) of this section will be the date the property is acquired by FmHA. When an account has been accelerated and one of the conditions outlined in paragraph (k)(1) of this section exists, the Interest Credit Agreement will remain in effect until it expires. No interest credit renewals will be processed on accounts that are under acceleration. If foreclosure action is dismissed, withdrawn or terminates without sale of the property or payment of the loan in full, a renewal agreement will be prepared with an effective date as of the expiration of the previous agreement.

(l) *Applicant or borrower notice of right to appeal.* All applicants or borrowers who request and are denied interest credit or whose interest credits are reduced, cancelled, or not renewed, will be notified of their appeal rights. If a decision is not appealable, such as decisions based on verified income, or clear and objective statutory or regulatory requirements, the applicant or borrower will receive review rights.

5. Exhibit D of Subpart A is amended by redesignating paragraphs 5 through

21 as 6 through 22 and adding a new paragraph 5 to read as follows:

Exhibit D—Rural Housing Applicant Interview

5. *Review of Federal Tax Returns and/or Audited or Certified Financial Statements:* The County Supervisor will review the applicant/borrower's most recently filed Federal income tax return and/or certified financial statement as part of the completed loan application during the application processing/interview.

BILLING CODE 3410–07–M

FEDERAL RESERVE SYSTEM

12 CFR Part 211

[Regulation K; Docket No. R-0793]

International Banking Operations

AGENCY: Board of Governors of the Federal Reserve System.

ACTION: Proposed rule.

SUMMARY: The Board is proposing an amendment to part 211 of its regulations concerning the permissible activities of state-licensed branches and agencies of foreign banks. Section 202(a) of the Federal Deposit Insurance Corporation Improvement Act of 1991 provides that after December 19, 1992, a state-licensed branch or agency of a foreign bank may not engage in any activity that is not permissible for a federal branch of a foreign bank unless the Board has determined that the activity is consistent with sound banking practice, and in the case of an insured branch, the Federal Deposit Insurance Corporation (FDIC) has determined that the activity would pose no significant risk to the deposit insurance fund. This proposed amendment to Regulation K sets forth the application procedures that state-licensed branches and agencies of foreign banks will be required to follow in order to request the Board's permission to engage in or continue to engage in an activity that is not permissible for a federal branch of a foreign bank and the requirements of divestiture and cessation plans. Insured branches are also required to seek the approval of the FDIC to engage in or to continue to engage in such an activity.

DATES: Comments must be received by March 5, 1993.

ADDRESSES: Comments, which should refer to Docket No. R-0793, may be mailed to the Board of Governors of the Federal Reserve System, 20th Street and Constitution Avenue, NW., Washington, DC 20551, to the attention of Mr. William W. Wiles, Secretary. Comments addressed to the attention to Mr. Wiles may be delivered to the Board's mailroom between the 8:45 am and 5:15 pm, and to the security control room outside of those hours. Both the mailroom and the security control room are accessible from the courtyard entrance on 20th Street between Constitution Avenue and C Street, NW. Comments may be inspected in room B-1122 between 9 am and 5 pm, except as provided in § 261.8 of the Board's Rules Regarding the Availability of Information, 12 CFR 261.8.

FOR FURTHER INFORMATION CONTACT: Kathleen M. O'Day, Associate General Counsel (202/452-3786), Ann E. Misback, Senior Attorney (202/452-3788), Margaret E. Miniter, Attorney (202/452-3900), John W. Rogers, Attorney (202/452-2798), Legal Division; Michael G. Martinson, Assistant Director (202/452-3640), Division of Banking Supervision and Regulation, Board of Governors of the Federal Reserve System. For the hearing impaired *only*, Telecommunication Device for the Deaf (TDD), Dorothea Thompson (202/452-3544), Board of Governors of the Federal Reserve System, 20th and C Street, NW., Washington, DC 20551.

SUPPLEMENTARY INFORMATION: Section 202 of the Act amended section 7 of the IBA by adding several new subsections concerning the establishment and termination of foreign bank branches in the United States. New subsection 7(h) of the IBA provides that after December 19, 1992, a state branch or state agency may not engage in any type of activity that is not permissible for a federal branch unless the Federal Reserve Board has determined that such activity is consistent with sound banking practice; and, in the case of an insured branch, the FDIC has determined that the activity would pose no significant risk to the deposit insurance fund. 12 U.S.C. 3105(h)(1).

In order to implement this provision, the Board is proposing to amend Regulation K (12 CFR part 211) concerning international banking operations by adding a new section to Subpart B entitled "Applications by State-Licensed Branches and Agencies to Conduct Activities Not Permissible for Federal Branches." This proposed new section provides that a foreign bank operating a state-licensed branch or agency in the United States, which desires to engage in or continue to engage in an activity that is not permissible for a federal branch, pursuant to statute, regulation or order or interpretation issued by the Comptroller of the Currency (OCC), shall file an application for permission to conduct or to continue conducting such activity with the Board.

Contents of Application

Section 211.29(b) of the proposed regulation provides that the application shall be in letter form and shall contain certain information, including among other things, a description of the activity in which the branch or agency desires to engage or in which it is already engaged, the foreign bank's financial condition, the assets and liabilities of the branch or agency, the projected effect of the proposed activity on the financial condition of the foreign bank and the branch or agency, and in the case of an application by a state-licensed insured branch, a statement of why the proposed activity will pose no significant risk to the deposit insurance fund.

In view of the fact that section 202(h) of the Act became effective on December 19, 1992, a foreign bank with a state branch or agency that currently is conducting an activity that is determined to be impermissible for a federal branch will not be able to obtain the Board's permission to continue the activity prior to that effective date. In such cases, the Board may permit any such branch or agency to continue to conduct the activity in question (at existing levels) until such time as the Board acts on its application. The Board expects any foreign bank engaged in an impermissible activity in a state-licensed branch or agency to file the required application promptly.

The Board and the FDIC have consulted concerning the type of information that each agency will need in order to make an informed judgment, and have agreed on a common list of information in order that applicants will need to prepare only one application which, in the case of insured branches, may be submitted to both agencies. It is contemplated that the Board and the FDIC will review such applications simultaneously. Moreover, the Board and the FDIC have attempted to balance their need for information on which to base their decisions with the cost to the applicant of gathering, organizing and submitting an application.

The Board is particularly interested in receiving comments concerning the amount and type of information requested pursuant to § 211.29(b) of the proposed regulation. Comment is also requested on whether there are certain

classes of activities that, even though not permitted for federal branches, nonetheless are consistent with sound banking practices, and whether a more limited prior written notice rather than a letter application could be utilized in connection with these types of activities. With respect to the activities described in the preceding sentence, commenters are requested to describe the activity in detail and to explain why its conduct by a state-licensed branch or agency would be consistent with sound banking practice.

In addition, the Board requests comment concerning whether the conduct by a state-licensed branch or agency of activities permitted by the OCC pursuant to informal interpretation, opinion or advice rather than by formal interpretation or opinion should require the filing of an application. In this regard, the Board will initiate consultations with the OCC on any questions of whether a particular activity is or is not permissible for a federal branch. The Board also seeks comment on potential coordination between applications to the Board and the FDIC as a way to make this process as efficient as possible.

Finally, the Board requests comment on whether an application should be required when a foreign bank wishes to convert a federally-licensed branch or agency to a state-licensed branch or agency. When the Board approved the final amendments to Regulation K concerning establishment of branches and agencies, the Board decided that an application would *not* be required when a foreign bank wished to convert from a state license to a federal license, because it would be converting from a less restrictive to a more restrictive regime. In light of the statutory provision limiting state office powers to those of a federal branch unless the Board and, in the case of an insured branch, the FDIC approve the activities, the Board is requesting comment on whether it is necessary to require an application when a foreign bank seeks to convert from a federal to a state license.

Standards to be Examined

Section 211.29(c) sets forth the standards that the Board will examine in order to determine whether a particular practice in consistent with sound banking practice. These factors are:

(1) What types of risks, if any, the activity poses to the foreign banking organization;

(2) If the activity poses any such risks, the magnitude of each risk; and

(3) If a risk is not *de minimis*, the actual or proposed procedures to control and minimize such risk.

Each of these factors shall be evaluated in light of the financial condition of the foreign bank in general and the branch or agency in particular and the volume of the proposed activity. The Board may also determine that a particular activity, after consideration of the above factors and subject to any conditions or limits imposed by the Board, may be conducted by any state-licensed branch or agency without further application to the Board.

Divestiture or Cessation

In the event that a state branch or agency is required to cease conducting an activity pursuant to the proposed regulation, § 211.29(e) of the proposed regulation sets forth the guidelines that must be followed to divest or cease the impermissible activity. Generally, this section provides that the state branch or agency shall submit a written plan of divestiture or cessation within 60 days of

(1) Being notified by the Board or the FDIC that an application to continue to conduct the activity has been denied;

(2) The effective date of the regulation in the event that the foreign bank elects not to apply for permission to continue to conduct the activity; and

(3) Any change in statute, regulation, order or OCC interpretation that renders the activity impermissible.

Divestiture or cessation shall be completed within one year, or sooner if the Board so directs. The Board requests comment on whether this period of time should be longer or shorter.

Application Not Required in Certain Instances.

The Board has determined that an application under this section normally shall not be required where an activity is permissible to a federal branch, but the OCC imposes a quantitative restriction on the conduct of such activity by the federal branch. As described in further detail above, the Board is requesting comment on whether there are any other classes of activities for which more limited prior notice would suffice.

Regulatory Flexibility Act

Pursuant to section 605(b) of the Regulatory Flexibility Act (Pub. L. 96-354, 5 U.S.C. 601 *et seq.*), it is certified that the proposed rule would not have a significant impact on a substantial number of small entities.

List of Subjects in 12 CFR Part 211

Exports, Federal Reserve System, Foreign banking, Holding companies, Investments, Reporting and recordkeeping requirements.

For the reasons outlined above, the Board is proposing to amend 12 CFR part 211 as set forth below:

PART 211—INTERNATIONAL BANKING OPERATIONS

1. The authority citation for part 211 continues to read as follows:

Authority: Federal Reserve Act (12 U.S.C. 221 *et seq.*); Bank Holding Company Act of 1956, as amended (12 U.S.C. 1841 *et seq.*); the International Banking Act of 1978, (Pub. L. 95-369; 92 Stat. 607; 12 U.S.C. 3101 *et seq.*); the Bank Export Services Act (Title II, Pub. L. 97-290, 96 Stat. 1235); the International Lending Supervision Act (Title IX, Pub. L. 96181, 97 Stat. 1153, 12 U.S.C. 3901 *et seq.*); and the Export Trading Company Act Amendments of 1988 (Title III, Pub. L. 100-418, 102 Stat 1384 (1988)).

2. Part 211 is amended by revising § 211.29 to subpart B to read as follows:

§ 211.29 Applications by state-licensed branches and agencies to conduct activities not permissible for federal branches.

(a) *Scope.* Any state-licensed branch or agency that desires to engage in or continue to engage, after December 19, 1992, in any type of activity that is not permissible for a federal branch, pursuant to statute, regulation or order or interpretation issued by the Comptroller, shall file a prior written application for permission to conduct such activity with the Board pursuant to this section.

(b) *Content of application.* An application submitted pursuant to paragraph (a) of this section shall be in letter form and shall contain the following information:

(1) A brief description of the activity, including the manner in which it will be conducted and an estimate of the expected dollar value;

(2) A discussion by management of its analysis regarding the impact of the proposed activity on the applicant's earnings, capital adequacy, and general condition, and on the balance sheet, earnings and condition of the branch or agency, including a copy, if available, of any feasibility study, management plan, financial projections, business plan, or similar document concerning the conduct of the activity;

(3) A current statement of the applicant's assets, liabilities, and capital;

(4) A current statement of the assets and liabilities of the branch or agency;

(5) A copy of applicant's most recent audited financial statements;

(6) A resolution by the applicant's board of directors or, if a resolution is not required pursuant to the applicant's organizational documents, evidence of approval by senior management, authorizing the conduct of such activity and the filing of this application;

(7) In the case of an insured branch, a statement by the applicant of whether or not it is in compliance with §§ 346.19 and 346.20, Pledge of Assets and Asset Maintenance, respectively, of 12 CFR part 346;

(8) In the case of an insured branch, a statement by the applicant that it has complied with all requirements of the Federal Deposit Insurance Corporation concerning applications to conduct the activity in question and the status of such application, including a copy of the FDIC's disposition of such application, if applicable;

(9) In the case of an insured branch, a statement of why the activity will pose no significant risk to the deposit insurance fund; and

(10) Any other information that the Reserve Bank deems appropriate.

(c) *Factors to be considered in determination.*

(1) The Board may consider the following factors in order to determine whether a proposed activity is consistent with sound banking practice:

(i) The types of risks, if any, the activity poses to the foreign banking organization;

(ii) If the activity poses any such risks, the magnitude of each risk; and

(iii) If a risk is not de minimis, the actual or proposed procedures to control and minimize such risk.

(2) Each of the factors set forth in paragraph (c)(1) of this section, shall be evaluated in light of the financial condition of the foreign bank in general and the branch or agency in particular and the volume of the activity.

(d) *Application procedures.* Applications pursuant to this section shall be filed with the responsible Reserve Bank for the foreign bank. An application shall not be deemed complete until it contains all the information requested by the Reserve Bank and has been accepted. Approval of such an application may be conditioned on the applicant's agreement to conduct the activity subject to specific conditions or limitations.

(e) *Divestiture or Cessation.*

(1) In the event that an applicant's application for permission to continue to conduct an activity is not approved by the Board or the FDIC, the applicant shall submit a detailed written plan of divestiture or cessation of the activity to the responsible Reserve Bank within 60 days of the disapproval. The divestiture or cessation plan shall describe in detail the manner in which the applicant will divest itself of or cease the activity in question and shall include a projected timetable describing how long the divestiture or cessation is expected to take. Divestitures or cessation shall be complete within one year from the date of the disapproval, or within such shorter period of time as the Board shall direct.

(2) In the event that a foreign bank operating a state branch or agency chooses not to apply to the Board for permission to continue to conduct an activity that is not permissible for a federal branch or which is rendered impermissible due to a subsequent change in statute, regulation, order or interpretation, the foreign bank shall submit a written plan of divestiture or cessation, in conformance with § 211.29(d)(1) of this part, within 60 days of the effective date of this rule or of such change in statute, regulation, order or interpretation, respectively.

By order of the Board of Governors of the Federal Reserve System, December 30, 1992.

William W. Wiles,

Secretary of the Board.

BILLING CODE 6210–01–F

DEPARTMENT OF TRANSPORTATION

Federal Aviation Administration

14 CFR Part 39

[Docket No. 92–NM–215–AD]

Airworthiness Directives; Airbus Industrie Model A320 Series Airplanes

AGENCY: Federal Aviation Administration, DOT.

ACTION: Notice of proposed rulemaking (NPRM).

SUMMARY: This document proposes the adoption of a new airworthiness directive (AD) that is applicable to certain Airbus Model A320 series airplanes. This proposal would require modification of the inner rear spar web. This proposal is prompted by reports that cracking was found in the inner rear spar web during fatigue testing. The actions specified by the proposed AD are intended to prevent fatigue cracking, which may lead to reduced structural integrity of the main landing gear.

DATES: Comments must be received by March 2, 1993.

ADDRESSES: Submit comments in triplicate to the Federal Aviation Administration (FAA), Transport Airplane Directorate, ANM–103, Attention: Rules Docket No. 92–NM–215–Ad, 1601 Lind Avenue, SW., Renton, Washington 98055–4056. Comments may be inspected at this location between 9 a.m. and 3 p.m., Monday through Friday, except Federal holidays.

The service information referenced in the proposed rule may be obtained from Airbus Industrie, Airbus Support Division, Avenue Didier Daurat, 31700 Blagnac, France. This information may be examined at the FAA, Transport Airplane Directorate, 1601 Lind Avenue, SW., Renton, Washington.

FOR FURTHER INFORMATION CONTACT: Greg Holt, Aerospace Engineer, Standardization Branch, ANM–113, FAA, Transport Airplane Directorate, 1601 Lind Avenue, SW., Renton, Washington 98055–4056; telephone (206) 227–2140; fax (206) 227–1320.

SUPPLEMENTARY INFORMATION:

Comments Invited

Interested persons are invited to participate in the making of the proposed rule by submitting such written data, views, or arguments as they may desire. Communications shall identify the Rules Docket number and be submitted in triplicate to the address specified above. All communications received on or before the closing date for comments, specified above, will be considered before taking action on the proposed rule. The proposals contained in this notice may be changed in light of the comments received.

Comments are specifically invited on the overall regulatory, economic, environmental, and energy aspects of the proposed rule. All comments submitted will be available, both before and after the closing date for comments, in the Rules Docket for examination by interested persons. A report summarizing each FAA-public contact concerned with the substance of this proposal will be filed in the Rules Docket.

Commenters wishing the FAA to acknowledge receipt of their comments submitted in response to this notice must submit a self-addressed, stamped postcard on which the following statement is made: "Comments to Docket Number 92–NM–215–AD." The postcard will be date stamped and returned to the commenter.

Availability of NPRMs

Any person may obtain a copy of this NPRM by submitting a request to the

FAA, Transport Airplane Directorate, ANM–103, Attention: Rules Docket No. 92–NM–215–AD, 1601 Lind Avenue, SW., Renton, Washington 98055–4056.

Discussion

The Direction Générale de l'Aviation Civile (DGAC), which is the airworthiness authority for France, recently notified the FAA that an unsafe condition may exist on Airbus Model A320 series airplanes. The DGAC advises that during fatigue testing, cracking was found in the inner rear spar adjacent to 10 bolt holes. Cracking adjacent to two of the holes was located at rib 5 of the main landing gear (MLG) support. Cracking adjacent to the other eight holes was located at the anchorage of the MLG actuating cylinder. This cracking occurred at 64,120 simulated flights. Fatigue cracking, if not detected and corrected, could result in reduced structural integrity of the main landing gear.

Airbus Industrie has issued Service Bulletin A320–57–1004, Revision 1, dated September 24, 1992, which describes procedures for modification of the inner rear spar web. This modification consists of cold working the 10 bolt holes in which cracking was found during fatigue testing of an Airbus Model A320 series airplane. The French DGAC classified this service bulletin as mandatory and issued Airworthiness Directive 92–202–031(B), dated September 30, 1992, in order to assure the continued airworthiness of these airplanes in France.

This airplane model is manufactured in France and is type certificated for operation in the United States under the provisions of § 21.29 of the Federal Aviation Regulations and the applicable bilateral airworthiness agreement. pursuant to this bilateral airworthiness agreement, the French DGAC has kept the FAA informed of the situation described above. The FAA has examined the findings of the French DGAC, reviewed all available information, and determined that AD action is necessary for products of this type design that are certificated for operation in the United States.

Since an unsafe condition has been identified that is likely to exist or develop on other airplanes of the same type design registered in the United States, the proposed AD would require modification of the inner rear spar web. The actions would be required to be accomplished in accordance with the service bulletin described previously.

Currently, no airplanes of U.S. registry would be affected by this AD. However, should one of the affected airplanes be imported and placed on the U.S. register, it would take approximately 60 work hours per airplane to accomplish the required actions, and the average labor cost would be $55 per work hour. Based on these figures, the total cost impact of the proposed AD on U.S. operators is estimated to be $3,300 per airplane.

The regulations proposed herein would not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government. Therefore, in accordance with Executive Order 12612, it is determined that this proposal would not have sufficient federalism implications to warrant the preparation of a Federalism Assessment.

For the reasons discussed above, I certify that this proposed regulation (1) is not a "major rule" under Executive Order 12291; (2) is not a "significant rule" under the DOT Regulatory Policies and Procedures (44 FR 11034, February 26, 1979); and (3) if promulgated will not have a significant economic impact, positive or negative, on a substantial number of small entities under the criteria of the Regulatory Flexibility Act. A copy of the draft regulatory evaluation prepared for this action is contained in the Rules Docket. A copy of it may be obtained by contacting the Rules Docket at the location provided under the caption "ADDRESSES."

List of Subjects in 14 CFR Part 39

Air transportation, Aircraft, Aviation safety, Safety.

The Proposed Amendment

Accordingly, pursuant to the authority delegated to me by the Administrator, the Federal Aviation Administration proposes to amend 14 CFR Part 39 of the Federal Aviation Regulations as follows:

PART 39—AIRWORTHINESS DIRECTIVES

1. The authority citation for part 39 continues to read as follows:

Authority: 49 U.S.C. App. 1354(a), 1421 and 1423; 49 U.S.C. 106(g); and 14 CFR 11.89.

§ 39.13 [Amended]

2. Section 39.13 is amended by adding the following new airworthiness directive:

Airbus Industrie: Docket 92–NM–215–AD.

Applicability: Model A320 series airplanes, manufacturer's serial numbers (MSN) 003 through 008, inclusive; MSN's 018 through 021, inclusive; certificated in any category.

Compliance: Required as indicated, unless accomplished previously.

To prevent fatigue cracking, which may lead to reduced structural integrity of the main landing gear, accomplish the following:

(a) Prior to the accumulation of 12,000 landings, or within 500 landings after the effective date of this AD, whichever occurs later, modify the inner rear spar web in accordance with Airbus Industrie Service Bulletin A320–57–1004, Revision 1, dated September 24, 1992.

(b) An alternative method of compliance or adjustment of the compliance time that provides an acceptable level of safety may be used if approved by the Manager, Standardization Branch, ANM–113. Operators shall submit their requests through an appropriate FAA Principal Maintenance Inspector, who may add comments and the sent it to the Manager, Standardization Branch.

Note: Information concerning the existence of approved alternative methods of compliance with this AD, if any, may be obtained from the Standardization Branch.

(c) Special flight permits may be issued in accordance with FAR 21.197 and 21.199 to operate the airplane to a location where the requirements of this AD can be accomplished.

Issued in Renton, Washington, on December 29, 1992.

David Hmiel,

Acting Manager.

BILLING CODE 4910–13–M

Office of the Secretary

14 CFR Part 300

[Docket 4852, Notice No. 92–36]

RIN 2105–AB89

Rules of Conduct in DOT Proceedings

AGENCY: Department of Transportation, Office of the Secretary.

ACTION: Notice of proposed rulemaking.

SUMMARY: The Department of Transportation is proposing amendments to its procedural regulations to permit Department staff to communicate informally with applicants and any objectors or other commenters in the initial investigation stage of air carrier initial certificate application and continuing fitness cases (collectively referred to as "fitness cases") where the issues are limited solely to fitness and/or U.S. citizenship. Under this proposal, once either a show cause order or an order instituting a formal proceeding is issued, the Department's current *ex parte* restrictions would apply. In several fitness proceedings, processing of those cases has been delayed unnecessarily or made more difficult because of the Department's inability under the current procedural regulations to discuss

informally aspects of the cases, in oral or written communications, with either the applicant carrier or objecting parties or other commenters. The proposed amendment would give the Department an added degree of flexibility in seeking information from all interested parties and would decrease the burden on applicants as well as objectors and other comments. However, it would still provide those parties a fair and complete opportunity to be heard and ensure an adequate record for the proceeding.

DATES: Comments must be submitted on or before February 22, 1993. Comments received after this date will be considered to the extent practicable. If adopted as a final rule, these amendments would take effect 30 days after publication of the final rule in the Federal Register.

ADDRESSES: Comments should refer to Docket 48582, and be submitted to: Docket Section (C–55), room 4107, Department of Transportation, 400 Seventh Street, SW., Washington, DC 20590. The Docket Section is open from 9 a.m. to 5 p.m., Monday through Friday, except holidays.

FOR FURTHER INFORMATION CONTACT: Patricia T. Szrom, Chief, Air Carrier Fitness Division (P–56), Office of the Secretary, Department of Transportation, 400 Seventh Street, SW., Washington, DC 20590, (202) 366–9721.

SUPPLEMENTARY INFORMATION:

Comments Invited

Interested persons are invited to participate in this rulemaking proceeding by submitting such written data, views, or arguments as they may desire. Comments that provide the factual basis supporting the views and suggestions presented are particularly helpful in developing reasoned regulatory decisions. Communications should identify the regulatory docket number and be submitted in duplicate to the address listed above. Commenters wishing the Department to acknowledge receipt of their comments must submit with those comments a self-addressed stamped postcard on which the following statement is made: "Comments on Docket 48582." The postcard will be date/time stamped and returned to the commenter. All communications received on or before the specified closing date will be considered by the Assistant Secretary for Policy and International Affairs before taking action on any further rulemaking. Also, this proposal may be changed in light of comments received. All comments submitted will be available for examination in Docket 48528. A report summarizing each substantive public contact with DOT personnel concerned with this rulemaking will be filed in the docket.

Background

Under section 401(a) of the Federal Aviation Act (the Act), a Certificate of Public Convenience and Necessity (certificate) must be obtained from the Department of Transportation (the Department) before an air carrier may engage in any air transportation operations (49 U.S.C. app. 1371(a)).[1] Section 418 of the Act contains a similar certification requirement for air carriers proposing to engage in domestic all-cargo air service (49 U.S.C. app. 1388). Following an investigation, if the Department finds that an applicant for authority under section 401 or 418 is a U.S. citizen that is "fit, willing, and able" to engage in air transportation operations and comply with the Act and the Department's regulations, a certificate is issued. The Department's "fitness" requirement is a continuing one for carriers; that is, once a carrier is found fit initially, it must remain fit in order to continue to hold its authority section 401(r) of the Act, 49 U.S.C. app. 1371(r)).

Carriers that apply for fitness determinations must comply with the Department's regulations concerning specific and general requirements for certificate applications (14 CFR part 201), including providing supporting data (14 CFR part 204). The Department's regulations allow any person to file an answer in support of or in opposition to the application within 28 days of the filing date of the application (14 CFR 302.1720(d)). If the application is opposed, the Department's regulations concerning prohibited communications come into play.

Part 300 of the Department's aviation economic regulations establishes the terms and conditions governing the rules of conduct for Department proceedings under Chapter II of Title 14 of the Code of Federal Regulations (14 CFR part 300). Among other provisions, part 300 generally prohibits oral or written communications relevant to the merits of a public proceeding between any concerned Department employee and any interested person outside the Department until after the Department's final disposition of the proceeding (the *ex parte* rule) (14 CFR 300.2). For purposes of the Department's review of the fitness of applicants for certificate authority or its consideration of docketed petitions for review of an air carrier's continuing fitness, the *ex parte* rules are triggered by the filing in the docket of an identifiable written opposition to the initiating document (14 CFR 300.2(b)(4)).

The Department's *ex parte* rules in fitness cases are more restrictive than the *ex parte* requirements established by the Administrative Procedure Act, 5 U.S.C. 557(d). Those requirements cover only proceedings for which a formal hearing is required by statute. Since section 401 of the Act gives us the discretion to determine whether an oral evidentiary hearing should be held in fitness cases, the Administrative Procedure Act's *ex parte* requirements do not apply to applications for certificate authority.

Proposed Rules

As described above, the *ex parte* rules, with a limited exception,[2] require that once a written opposition to an application for certificate authority is filed all substantive communications between the Department and either the applicant or the opposing party or other commenters be made through documents that are filed in the docket and distributed to all the parties. In practice, the Department has found that the *ex parte* provisions of part 300 often unnecessarily delay the processing of fitness cases or make the processing unduly difficult.

The Department believes that application of the *ex parte* rules to all stages of fitness cases is often counter-productive. Many complex issues relating to the application and the objections to the application could more readily be resolved through informal investigative-type discussions with the applicant, the objectors, or any other interested parties. However, that informal type of inquiry is prohibited by the current rules.

Instead, the Department's staff must go through the burdensome task of putting all of its questions in writing, filing them in the docket, and serving them on all parties. The applicant must likewise respond in writing through the docket, with copies to all parties. Often responses to staff questions need clarification or spawn further inquiries. Moreover, questions asked by the Department's staff of the applicant may

[1] The Department has the authority under section 416(b) of the Act (49 U.S.C. 1386(b)) to exempt carriers from the certification requirement when doing so would be consistent with the public interest. For example, under 14 CFR 298.11, air taxi operators are exempt from the certification requirement.

[2] The exception concerns documents placed in the correspondence section of the docket per 14 CFR 300.3.

themselves require clarification before a proper response can be made. As a result, often matters that could be cleared up in minutes by telephone or in a meeting can drag on for days or weeks solely due to the tedious procedures of on-the-record communications required under the current rules. Overall, the process is often cumbersome and time-consuming.

Carrier applicants are not the only persons who suffer as a result. For example, the Department's staff cannot under present *ex parte* rules ask simple questions of an objector in an effort to verify the facts contained in the filing objecting to the application without a similarly unwieldy and protracted written procedure.

The fact-finding nature of the initial phase of fitness cases lends itself to an informal, rather than a formal, on-the-record investigative procedure. The Act requires that the Department find an applicant "fit, willing, and able." In fitness cases where the issues are limited to determinations of fitness and/or U.S. citizenship, the Act does not require that the Department choose the best applicant; there are no comparative rights at issue.[3] The Department believes that for fitness cases where the issues are thus limited, the intensive fact-finding required in the initial phase of those cases is best achieved by unobstructed lines of communication between the Department, the applicant, and other interested persons.

The Department continues to believe that the *ex parte* restrictions are appropriate once a show cause order or an order instituting a formal proceeding is issued to ensure due process for all applicants and informed, on-the-record decisionmaking. Therefore, the Department would retain the benefits offered by the *ex parte* restrictions where they are most appropriate to on-the-record decisionmaking: after issuance of a show cause order or other order instituting a formal proceeding. Moreover, the Department's orders ruling on the merits of a certificate application will set forth the factual basis for the Department's tentative and final conclusions on the applicant's fitness and citizenship, if the Department uses show-cause procedures for considering the application. Parties will therefore know what information is being relied upon by the Department in its analysis and will have an opportunity to comment on the findings of fact. If the Department determines to hold an oral evidentiary hearing on an application, the Department's ultimate decision will be based on the record developed in the formal hearing proceeding. As a result, the proposed rule will not deny any party ability to participate fully and fairly in a fitness proceeding.

In line with the action proposed here, where expedition and an unfettered ability to gather information is in the public interest, part 300 already provides for several exceptions to the prohibition against substantive *ex parte* communications (14 CFR 300.2(c)). For example, part 300 permits communications made in the course of an investigation to determine whether formal enforcement action should be taken (14 CFR 300.2(c)(3)). The initial review phase of a fitness case is very similar to an investigation conducted to determine whether reasonable cause exists to institute a formal enforcement proceeding, with the issuance of a show cause order in a fitness proceeding the equivalent of the issuance of a Notice of Enforcement Proceeding and filing of an accompanying formal complaint in the enforcement context.[4]

Accordingly, the Department proposes to amend section 300.2, *Prohibited communications*, by adding paragraph (c)(10) that would create an exception to the prohibition of *ex parte* communications made in the course of docketed cases where the issues are limited to determinations of fitness and/or U.S. citizenship, prior to the issuance of a show cause order or an order instituting a formal proceeding. Once either type of order is issued, the *ex parte* communications prohibitions would apply. This proposal would facilitate the collection of information needed for consideration of cases, minimize the time and resources necessary for parties to process cases, yet continue to ensure procedural fairness for all parties.

Executive Order 12291 (Federal Regulation) and DOT Regulatory Policies and Procedures

The Department has analyzed the economic and other effects of this proposal and has determined that they are neither "major" within the meaning of Executive Order 12291 nor "significant" within the meaning of the Department's regulatory policies and procedures. The Department has also determined that the economic effects of the proposed amendments are so minimal that a full regulatory evaluation is not required. If these amendments are adopted, fitness application costs to carriers and costs to opposing parties should be slightly lower due to the less formal procedures that would replace the current procedures.

Regulatory Flexibility Act

In accordance with the Regulatory Flexibility Act, the Department has evaluated the effects of this proposed action on small entities. Based upon this evaluation, the Department certifies that the proposed amendments would not have a significant economic impact on a substantial number of small entities. As stated above, the Department believes that the proposed amendments would create a slight economic benefit for parties in fitness cases.

Executive Order 12612 (Federalism)

This proposed rule has been analyzed in accordance with the principles and criteria contained in Executive Order 12612. The Department has determined that the proposed rule does not have sufficient federalism implications to warrant the preparation of a Federalism Assessment. This proposed rule would not have a substantial direct effect on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government.

Naitonal Environmental Policy Act

The Department has also analyzed this proposed rule for the purpose of the National Environmental Policy Act. The Department has determined that the proposed rule would not have any significant impact on the quality of the human environment.

List of Subjects in 14 CFR Part 300

Administration practice and procedure, Conflict of interests, Rules of conduct, Prohibited communications.

For the reasons set out in the Supplementary Information, title 14, chapter II of the Code of Federal Regulations is proposed to be amended as follows:

PART 300—[AMENDED]

1. The authority citation for part 300 would continue to read as follows:

Authority: 49 U.S.C. 1324, 1371–1389, 1471, 1473, 1481, 1482, and 1487, 18 U.S.C. 20(b)(c); 49 U.S.C. Subtitle I.

2. Section 300.2 would be amended by adding new paragraph (c)(10) to read as follows:

[3] In cases where comparative rights are at issue, such as where the authority sought includes a market or markets where entry is limited by a bilateral agreement and there are competing proposals, the current *ex parte* rules would continue to apply.

[4] Indeed, certain continuing fitness proceedings may be more akin to enforcement investigations than to initial fitness proceedings.

§ 300.2 Prohibited communications.

* * * * *

(c) * * *

(10) Docketed proceedings involving determinations of fitness and/or U.S. citizenship only, for that portion of the proceeding that precedes the issuance of a show cause order or an order instituting a formal proceeding.

* * * * *

Issued in Washington, DC, on December 30, 1992.

Jeffrey N. Shane,

Assistant Secretary for Policy and International Affairs.

BILLING CODE 4910–62–M

DEPARTMENT OF ENERGY

Federal Energy Regulatory Commission

18 CFR Parts 35 and 290

[Docket No. RM85–17–000]

Regulation of Electricity Sales-for-Resale and Transmission Service

Issued December 28, 1992

AGENCY: Federal Energy Regulatory Commission, DOE.

ACTION: Order Terminating Docket.

SUMMARY: The Federal Energy Regulatory Commission (Commission) is terminating this proceeding because the Notices of Inquiry accomplished their purpose by generating public comments on the Commission's pricing and other regulatory policies, and because the information collected has since been overtaken by events.

FOR FURTHER INFORMATION CONTACT: Lawrence R. Greenfield, Deputy Assistant General Counsel, Office of the General Counsel, Federal Energy Regulatory Commission, 825 N. Capitol St., NE., Washington, DC 20426, Telephone: (202) 208–0415.

SUPPLEMENTARY INFORMATION: In addition to publishing the full text of this document in the **Federal Register**, the Commission also provides all interested persons an opportunity to inspect or copy the contents of this document during normal business hours in room 3308, 941 North Capitol Street, NE., Washington, DC 20426.

The Commission Issuance Posting System (CIPS), an electronic bulletin board service, provides access to the texts of formal documents issued by the Commission. CIPS is available at no charge to the user and may be accessed using a personal computer with a modem by dialing (202) 208–1397. To access CIPS, set your communications software to use 300, 1200 or 2400 baud, full duplex, no parity, 8 data bits, and 1 stop bit. The full text of this document will be available on CIPS for 10 days from the date of issuance. The complete text on diskette in WordPerfect format may also be purchased from the Commission's copy contractor, La Dorn Systems Corporation, also located in room 3308, 941 North Capitol Street, NE., Washington, DC 20426.

Order Terminating Docket

On May 30, 1985 and June 28, 1985, the Commission issued two Notices of Inquiry in this proceeding to evaluate its then-present policies toward wholesale electricity transactions and transmission service, and to evaluate whether those policies promoted or impeded efficiency in electricity markets and whether there were alternatives or possible revisions that would further promote efficiency in the electric utility industry.[1] For the reasons given below, we are terminating this docket.

Background

As noted, in mid-1985, the Commission issued two Notices of Inquiry in a "broad inquiry into the regulation of electric utilities selling in wholesale markets."[2]

In the first Notice of Inquiry, the Commission addressed its regulation of coordination transactions and transmission service. With respect to such coordination transactions, the Commission reviewed its pricing policies, summarizing its then-current policies and asking commenters to address both those policies as well as possible alternatives.[3] With respect to transmission service, the Commission reviewed both pricing and availability, again summarizing its then-current policies and asking commenters to address those policies and possible alternatives.[4]

In the second Notice of Inquiry, the Commission addressed its regulation of requirements service. The Commission reviewed its then-current pricing practices and possible alternatives, as well as questions concerning the allocation of risk, and asked commenters to address these matters.[5]

Comments were filed as to both Notices of Inquiry by a broad cross-section of those involved in the electric utility industry—Federal and state governmental bodies (including the United States Department of Energy and various state commissions), electric utilities, customers and customer groups, and consultants and other persons active in the industry. In addition, the Commission held public conferences at which the matters raised by the Commission and commented upon by the various commenters were discussed.

Discussion

The Commission issued the two Notices of Inquiry, solicited comments, and held public conferences to learn whether the various segments of the electric utility industry—including utilities, customers, and regulations—believed the Commission's pricing and other regulatory policies were promoting or impeding efficiency, and what alternatives or changes might better promote efficiency.[6] Having received comments and having held the public conferences, that purpose was accomplished.

Moreover, much has changed since 1985. The Energy Policy Act of 1992, Public Law No. 102–486, 106 Stat. 2776 (1992), has been enacted. That Act, *inter alia*, provides for a new category of power producers, exempt wholesale generators or EWGs, which are exempt from regulation by the Securities and Exchange Commission under the Public Utility Holding Company Act of 1935, 15 U.S.C. 79a *et seq.* (1988). That Act also expands the Commission's ability to order transmission. Additionally, the Commission itself has, for example, accepted non-cost-based, market-based rates for service,[7] and has permitted public utilities to price their power and energy to respond to competitive pressures.[8]

In sum, the information sought by the Commission in its NOI's, and provided

BILLING CODE 6717–01–M

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Food and Drug Administration

21 CFR Part 135

[Docket No. 88P–0251]

Frozen Desserts: Removal of Standards of Identity for Ice Milk and Goat's Milk Ice Milk; Amendment of Standards of Identity for Ice Cream and Frozen Custard and Goat's Milk Ice Cream

AGENCY: Food and Drug Administration, HHS.

ACTION: Proposed rule.

SUMMARY: The Food and Drug Administration (FDA) is proposing: (1) To remove the standard of identity for ice milk, and (2) to amend the standard of identity for ice cream and frozen custard to provide for the use of safe and suitable sweeteners and to allow for the use of skim milk that may be concentrated, and from which part or all of the lactose has been removed by a safe and suitable procedure, in the food. To ensure consistency with the removal of the standard of identity for ice milk and the proposed changes in the standard of identity for ice cream and frozen custard, FDA is also proposing to remove the standard of identity for goat's milk ice milk and to make comparable changes in the standard of identity for goat's milk ice cream which cross-references the standard of identity for ice cream and frozen custard. FDA tentatively finds that these actions will promote honesty and fair dealing in the interest of consumers.

DATES: Comments by March 8, 1993. FDA proposes that any final rule that may issue based on this proposal, unless stayed by the filing of proper objections, become effective 1 year following the date of publication of the final rule in the **Federal Register**.

ADDRESSES: Written comments to the Dockets Management Branch (HFA–305), Food and Drug Administration, rm. 1–23, 12420 Parklawn Dr., Rockville, MD 20857.

FOR FURTHER INFORMATION CONTACT: Margaret E. Cole, Center for Food Safety and Applied Nutrition (HFF–414), Food and Drug Administration, 200 C St. SW., Washington, DC 20204, 202–205–4745.

SUPPLEMENTARY INFORMATION:

I. Background

A. The 1991 Advance Notice of Proposed Rulemaking

In the **Federal Register** of January 22, 1991 (56 FR 2149), FDA announced, in an advance notice of proposed rulemaking (ANPRM), that petitions had been filed in Docket No. 88P–0251 by the International Ice Cream Association (IICA), 888 16th St. NW., Washington, DC 20006, a trade association representing manufacturers and distributors of ice cream and other frozen desserts (petition dated February 23, 1990, and amended March 29, 1990); Public Voice for Food and Health Policy (Public Voice), 1001 Connecticut Ave. NW., Suite 522, Washington, DC 20036, a national nonprofit consumer research, education, and advocacy organization (petition dated March 30, 1990); The Calorie Control Council (the Council), 5775 Peachtree-Dunwoody Rd., Atlanta, GA 30342, an international association of manufacturers of low calorie and diet foods and beverages, including manufacturers of a variety of sweeteners and other low calorie ingredients (petition dated March 5, 1990); and Kraft General Foods (KGF), 1880 JFK Blvd., Philadelphia, PA 19103, a manufacturer and distributor of a broad range of food products within the United States (petition dated October 16, 1989, and submitted on March 14, 1990). The petitioners requested that the agency: (1) Amend the standard of identity for ice milk (§ 135.120 (21 CFR 135.120)) to change the name of the food from "ice milk" to "reduced fat ice cream;" (2) establish new standards of identity for "lowfat ice cream" and "nonfat ice cream;" (3) provide for the use of any safe and suitable sweeteners in the new or revised standards for "reduced fat," "lowfat," and "nonfat" ice cream products; and (4) amend the standard of identity for ice cream (135.110 (21 CFR 135.110)) to provide for the use of any safe and suitable sweeteners. Interested persons were given until March 25, 1991, to comment.

In the ANPRM, FDA specifically requested comments on whether the suggested names "reduced fat ice cream," "lowfat ice cream," and "nonfat ice cream" would be misleading to consumers. The agency also requested data and information concerning the need for, and appropriateness of, such new or revised standards, as well as on a number of factors including, but not limited to:

(1) The minimum weight per gallon requirement;

(2) The minimum total nonfat milk solids requirement;

(3) The milkfat content requirements;

(4) The use of "nonfat" on a product that may contain up to 0.5 percent milkfat;

(5) The use of "lowfat" on a product that may contain 2 percent milkfat;

(6) Whether the limitations on fat content should apply to the milkfat content of the basic mix or to the total fat content of the product including the fat contributed by characterizing flavoring ingredients (e.g., milk chocolate, butterscotch, and nuts) that may be added to the basic ice cream mix;

(7) Nutritional equivalency, i.e., whether these products should contain added vitamins and minerals;

(8) The suitability of, need for, and conditions of use of any safe and suitable sweeteners, including alternative sweeteners such as saccharin and aspartame;

(9) The need to amend the goat's milk ice cream and goat's milk ice milk standards of identity (§§ 135.115 and 135.125 (21 CFR 135.115 and 135.125)) to be consistent with any changes made in the ice cream and ice milk standards of identity (§§ 135.110 and 135.120);

(10) Alternative ways of addressing the underlying issue raised by the petitions, i.e., providing for lower fat ice cream products under the name "ice cream;"

(11) The alternative language, suggested by FDA, to describe the

---

[9] As to an agency's considerable discretion not to initiate a rulemaking and its discretion not to promulgate a final rule after a notice of proposed rulemaking has been issued, *see, e.g.*, Western Fuels-Illinois, Inc. v. ICC, 878 F.2d 1025, 1027, 1031 (7th Cir. 1989); Williams Natural Gas Company v. FERC, 872 F.2d 436, 443–44, 450 (D.C. Cir. 1989); Arkansas Power & Light Company v. ICC, 725 F.2d 716, 723 (D.C. Cir. 1984); Professional Drivers Council v. Bureau of Motor Carrier Safety, 706 F.2d 1216, 1220–21 (D.C. Cir. 1983).

These decisions involve situations different than the facts here—*i.e.*, decisions not to institute rulemaking proceedings at all or not to promulgate final rules after notices of proposed rulemaking, as compared to terminating a proceeding involving a notice of inquiry. However, the deference accorded to administrative agencies in the former circumstances (and especially the considerable deference accorded if the agency's decision is not to institute rulemkaing proceedings) is no less appropriate here.

permitted optional sweeteners as "any sweetener that has been affirmed as generally recognized as safe (GRAS) or approved as a food additive for this use by the FDA" instead of the phrase "any safe and suitable sweeteners," as suggested by the petitioners; and

(12) The impact on small businesses if proposals, as suggested by the petitioners, were adopted.

B. The 1991 Proposals

On November 8, 1990, the President signed into law the Nutrition Labeling and Education Act of 1990 (1990 amendments) (Pub. L. 101–535). Section 3(b)(1)(A) of the 1990 amendments (21 U.S.C. 343) requires FDA to issue regulations that define claims characterizing the level of any nutrient that is of a type required to be declared in nutrition labeling. Specifically, the 1990 amendments direct FDA to promulgate regulations prescribing the use of the terms "free," "low," "light" or "lite," "reduced," "less," and "high" to characterize the level of these nutrients, unless the Secretary of Health and Human Services finds that the use of any such term would be misleading (section 3(b)(1)(A)(iii) of the 1990 amendments).

In its implementation of the 1990 amendments, FDA published a number of food labeling proposals in the November 27, 1991, **Federal Register**. In one document entitled "Food Labeling: Nutrient Content Claims, General Principles, Petitions, Definition of Terms" (56 FR 60421), FDA proposed to establish regulations that define specific nutrient content claims including the terms "low," "free," "reduced," "light" or "lite," "source," and "high." Further, in the November 27, 1991, document the agency proposed to provide for comparative claims that use the terms "less," "fewer,"and "more." In another document entitled "Food Labeling: Definitions of Nutrient Content Claims for the Fat, Fatty Acid, and Cholesterol Content of Food" (56 FR 60478), FDA proposed to establish definitions for fat, fatty acid, and cholesterol claims as well as requirements for the proper use of such terms as "reduced fat," "lowfat," and "nonfat" on food labels.

In the November 27, 1991, **Federal Register**, FDA also published a proposal entitled "Food Standards: Requirements for Substitute Foods Named by Use of a Nutrient Content Claim and a Standardized Term" (hereinafter referred to as the general standard proposal) (56 FR 60512). In that document, FDA proposed to amend the general provisions for food standards to prescribe a general definition and standard of identity for foods named by use of a nutrient content claim defined in part 101 (21 CFR part 101) (such as "fat free," "low calorie," and "light") in conjunction with a traditional standardized name (e.g., "reduced fat ice cream").

After consulting with Public Voice and KGF about the course of action that should be taken in light of the general standard proposal (56 FR 60512), IICA, in a letter dated January 15, 1992, amended its petitions of February 23, 1990, and March 29, 1990. IICA's amended petition withdrew its February 23, 1990, petition as it related to the establishment of standards of identity for "reduced fat ice cream," "lowfat ice cream," and "nonfat ice cream" and requested that the standard of identity for ice milk be removed. Subsequently, in a letter dated March 12, 1992, KGF withdrew its petition to establish a new standard of identity for nonfat ice cream. Shortly thereafter, on April 10, 1992, Public Voice withdrew its petition. Both KGF and Public Voice supported IICA's request that the standard of identity for ice milk be removed. KGF also supported IICA's petition for the use of safe and suitable sweeteners. Public Voice stated that it neither supported nor opposed IICA's recommendation on this issue.

C. The 1992 Final Rules

Elsewhere in this issue of the Federal Register, FDA is publishing two related final rules to implement section 3(b)(1)(A) of the 1990 amendments. They are: (1) "Food Labeling: Nutrient Content Claims, General Principles, Petitions, Definitions of Terms" (hereinafter referred to as the nutrient content claims final rule); and (2) "Food Standards: Requirements for Foods Named by Use of a Nutrient Content Claim and a Standardized Term" (hereinafter referred to as the general standard final rule).

In the nutrient content claims final rule, FDA is establishing in part 101 definitions for nutrient content claims together with general principles and procedures governing their use. Nutrient content claims for the fat content of foods are defined in new § 101.62 and include: "nonfat" (new § 101.62(b)(1)), "lowfat" (new § 101.62(b)(2)), and "reduced fat" (new § 101.62(b)(4)). The term "light" (or "lite") is defined in new § 101.56.

In the general standard final rule, FDA is establishing a general definition and standard of identity in new § 130.10 for modified versions of standardized foods. Specifically, the new general standard final rule, in new § 130.10, permits the use of FDA-defined nutrient content claims for fat content, such as "reduced fat," "lowfat," and "nonfat," in conjunction with the names of traditional standardized foods in parts 131 through 169 (21 CFR parts 131 through 169) in naming these new foods that have been specially formulated to reduce the level of fat in the product in new § 130.10(a). For example, the general standard final rule establishes conditions whereby the terms "reduced fat," "lowfat," and "nonfat" can be used with the standardized term "ice cream" for foods that resemble and substitute for ice cream but contain less milkfat than regular ice cream.

Under the general standard final rule, the modified version of the traditional product must not be nutritionally inferior to the traditional food that it resembles and for which it is intended to substitute (new § 130.10(b)). In addition, the food must possess similar performance properties and organoleptic characteristics (new § 130.10(c)), and it must be prepared from the same ingredients as the traditional standardized food, except that safe and suitable ingredients to improve texture, add flavor, add sweetness, prevent syneresis, extend shelf life, or improve appearance are allowed (new § 130.10(d)(1)). Further, to replace fat and calories, appropriate fat analogs and water may be added to modified versions of the traditional standardized foods defined in parts 131 through 169 (new § 130.10(d)(5)). Ingredients not provided for by the standard of identity, and ingredients used in excess of those provided for by the standard e.g., water to replace fat, must be identified as such in the ingredient statement (new § 130.10(f)(2)).

Thus, terms such as "reduced fat," "lowfat," and "nonfat" can be used in conjunction with the name "ice cream" as long as their use complies with new § 130.10 and is not false or misleading to consumers, and as long as the modified version does not purport to be a food to which another standard of identity applies. For example, without the changes proposed below, a reduced fat ice cream product that complies with the existing standard of identity for ice milk must be labeled as "ice milk."

II. Frozen Desserts—Legal Authority

Section 8 of the 1990 amendments removes food standards from the coverage of section 701(e) of the Federal Food, Drug, and Cosmetic Act (the act) (21 U.S.C. 371(e)) except for:

* * * any action for the amendment or repeal of any definition and standard of identity under section 401 of the act for any dairy products (including products regulated under parts 131, 133, and 135 of title 21,

Code of Federal Regulations) or maple sirup (regulated under § 168.140 of title 21, Code of Federal Regulations).

In this document, FDA is proposing to remove (i.e., repeal) the standards of identity for ice milk (§ 135.120) and goat's milk ice milk (§ 135.125) and to amend the standards of identity for ice cream (§ 135.110 (21 CFR 135.110)) and goat's milk ice cream (§ 135.115 (21 CFR 135.115)). Because these proposed actions are to remove and to amend standards for dairy products, they are subject to the formal rulemaking procedures of section 701(e) of the act. Section 701(e) of the act, unlike the informal rulemaking procedures of section 701(a) of the act, requires that the agency hold a formal evidentiary hearing if objections that raise issues of material fact are filed in response to final rules to establish, amend, or remove a food standard.

III. IICA's and the Council's Statement of Grounds and Review of Comments

A. IICA's and the Council's Statement of Grounds

FDA summarized in the ANPRM the statements of grounds submitted by IICA and the Council in support of their suggested changes concerning safe and suitable sweeteners. In that ANPRM, FDA noted that the petitioners had argued that permitting the use of safe and suitable sweeteners in frozen desserts would help consumers to meet national nutritional goals and would ultimately enhance the public health by increasing the availability in the marketplace of ice cream products low in calories and sugars. Further, the agency noted that the petitioners had asserted that the provision concerning safe and suitable sweeteners would create consistency in the naming of new ice cream products and would provide label information about sweeteners to consumers.

B. Summary of Comments

FDA received and reviewed 65 letters, each containing one or more comments, from consumers, the food industry, academia, trade associations, and consumer organizations in response to the ANPRM on the standards for ice cream and ice milk and the need to establish standards for reduced fat, lowfat, and nonfat ice creams. The comments generally supported the petitioners' requests as published in the ANPRM.

Some comments addressed issues unrelated to the establishment of standards of identity for "reduced fat ice cream," "lowfat ice cream," and "nonfat ice cream." However, many comments specifically addressed the need to establish such standards. With regard to the need to establish such standards, FDA received one or more comments addressing each of the following issues:

(1) Percentage declaration of milkfat content;

(2) Minimum weight per gallon;

(3) Total solids requirement for lowfat and nonfat ice cream;

(4) Establishment of 5 percent milkfat, as compared to 7 percent milkfat, as the maximum milkfat content of reduced fat ice cream;

(5) Maximum fat level in nonfat ice cream and the contribution of high fat flavoring ingredients;

(6) Nutritional equivalency;

(7) Declaration of the fat content to include flavoring ingredients; and

(8) "Reduced fat" labeling on products with a 50 percent reduction in fat.

The agency believes that the new requirements that it has established in the general standard final rule in new § 130.10 for modified foods named by use of a nutrient content claim and a standardized term (e.g., reduced fat ice cream) eliminate the need for individual standards of identity for these lower fat ice cream products. Moreover, in that document, FDA responds to many of the comments on the need for such standards. For example, among other issues, the preamble to the general standard final rule addresses the issues of minimum weight per gallon, the total solids requirement, the definition of "reduced fat ice cream," the definition of "nonfat ice cream," and nutritional equivalency. Therefore, in light of: (1) New § 130.10 in the general standard final rule; and (2) the petitioners' concurrence that individual standards are no longer necessary, as evidenced by the withdrawal of their petitions for establishing such individual standards, FDA believes that further regulatory action to establish standards for reduced fat, lowfat, and nonfat ice cream products is unnecessary. Therefore, FDA has fully addressed the comments relating to this issue, and there is no need to address them any further.

The agency will describe the relevant comments as they relate to the removal of the ice milk standard and to the amendment of the ice cream standard in the discussion of the proposed regulation that follows.

IV. The Proposal

A. Ice Milk

Comments received by the agency in response to the ANPRM did not specifically address the issue of removing the standard of identity for ice milk. However, the amended petitions from IICA, Public Voice, and KGF supported the removal of the ice milk standard so as to provide for lower fat ice cream products such as "reduced fat ice cream."

If FDA removes the "ice milk" standard, then under the general standard final rule, manufacturers will be free to label as "reduced fat ice cream" those frozen desserts that meet the agency's definition of "reduced fat" in new § 101.62(a)(4) of the nutrient content claim final rule and that comply with the definition and standard of identity for ice cream in § 135.110 except for those deviations from that standard that are provided for in new § 130.10 of the general standard final rule. The agency is defining "reduced fat" to mean a total fat content at least 25 percent less than the total fat content of an appropriate reference food (new § 101.62(b)(4)). Many products that now bear the name "ice milk" on their labels could, without reformulation, be redesignated as "reduced fat ice cream" under the general standard of identity (new § 130.10) if the ice milk standard is removed.

However, reduced fat ice cream must also contain less than the minimum 10 percent milkfat provided for in traditional standardized ice cream in accordance with § 135.110(a)(2). Frozen dessert products that meet the standard for ice cream (i.e., that contain a minimum of 10 percent milkfat or a minimum of 8 percent milkfat in products where bulky flavors are used) must be labeled as ice cream. Thus, a manufacturer that reduces the fat level in the company's "super premium" product (e.g., vanilla ice cream with a milkfat content of 14 percent) by 25 percent would not be able to designate the product as "reduced fat ice cream." In this instance, because the product would contain a level of milkfat that is consistent with the minimum milkfat level for ice cream in § 135.110(a)(2), the product would still be ice cream and would have to be named accordingly. However, the product could bear on its label a truthful statement explaining that the product contains 25 percent less fat than the company's "super premium" product.

Moreover, Public Voice mentioned in its petition that the use of the name "ice milk" reduces the marketability of a food that is similar to ice cream but that contains less fat. Thus, redesignation of the product as "reduced fat ice cream" may improve the marketability of the product and consequently may promote its consumption in place of full fat ice cream. Replacement of regular full fat ice cream in the diet with a lower fat version of ice cream will help

consumers to achieve one of the recommended national nutritional goals (i.e., to reduce dietary fat levels).

Therefore, the agency is proposing to remove the standard of identity for ice milk in § 135.120.

B. Safe and Suitable Sweeteners

In their petitions, IICA and the Council requested that FDA provide for the use of any safe and suitable sweeteners in ice cream products. In the ANPRM, the agency asked whether the language in the current standards that requires that all ingredients used in the food be "safe and suitable" should be expanded to provide for the use of "any safe and suitable sweeteners." FDA notes that the standard of identity in § 135.110 now provides only for the use of safe and suitable nutritive carbohydrate sweeteners in ice cream. Further, to ensure that the use of sweeteners that have not been determined by FDA to be safe is prohibited in these foods, the agency suggested that the permitted optional sweeteners be described in the standards as "any sweetener that has been affirmed as GRAS or approved as a food additive for this use by the FDA."

The majority of the comments addressing this issue supported the use of alternative sweeteners (i.e., sweeteners other than nutritive carbohydrate sweeteners), such as aspartame and saccharin, in new food products because the use of these sweeteners would increase the availability of lower calorie frozen desserts. Many of these comments also approved of the language, suggested by FDA, that the sweeteners used in the ice cream products be either "affirmed as GRAS or approved for this use by FDA" instead of the usual "safe and suitable" language. Several persons maintained that this language would ensure that the sweeteners used would be safe for this use. Other comments believed that either statement is acceptable.

A few comments, however, were concerned that the proposed FDA language would create a mandatory safety evaluation system for all optional sweeteners in ice cream products irrespective of their possible GRAS status. The comments contended that such a requirement would be an inappropriate use of food standards and would use standards as a vehicle for circumventing the safety review procedures established by the act. A trade association was concerned that the FDA suggested language was a return to the pre-1974 practice of defining acceptable ingredients for each food standard.

A comment from the Council stated that FDA's concern about the use of unapproved food additives is fully addressed by the use of the term "safe and suitable," which the agency already has defined in § 130.3(d)(21 CFR 130.3(d). The comment pointed out that the purpose of FDA's codification of the definition of "safe and suitable" was to avoid repeating the same definition in each individual standard. The comment concluded that a change in the "safe and suitable" language of the standards is not necessary.

Although the "safe and suitable" language does not directly cite GRAS substances, the agency acknowledges that this language includes them because safe and suitable ingredients include substances that are not unapproved food additives. The agency acknowledges that the suggested alternative FDA language could be interpreted as eliminating from use in ice cream products certain sweetening ingredients whose use is not specifically provided for in current FDA regulations. The agency also notes that the general provisions for food standards in § 130.3(c) strengthen the safety requirements of § 130.3(d). These general provisions provide that no provisions of food standards may be construed as in any way affecting the concurrent applicability of the general provisions of the act and the regulations thereunder relating to adulteration and misbranding. Thus, § 130.3(c) of the general provisions for food standards reinforces the requirement that sweetening additives must be safe and in compliance with sections 201(s) and 409 of the act (21 U.S.C. 321(s) and 348). Therefore, FDA has decided to use the safe and suitable language in describing the sweetening ingredients permitted in ice cream products in this proposal.

However, this tentative decision should not be construed as agency concurrence with independent GRAS determinations. The agency points out that it cannot agree that a sweetener is GRAS for some intended use in a food until it has reviewed all pertinent data on the ingredient and made a determination that it is safe for such use. FDA cautions that, without appropriate authorization, companies or individuals who make a GRAS determination on an ingredient take the risk that the agency will disagree with them and take regulatory action against the use of the substance.

One comment stated that the agency should reject the petition to add a provision to permit the use of "any safe and suitable sweeteners" in these products. It expressed the opinion that more information is needed on the long-term safety of some alternative sweeteners that may be used in foods.

FDA advises that any safe and suitable sweetener, whether GRAS or an approved food additive, presumably is viewed as safe for its intended use by experts, qualified by scientific training and experience, to evaluate the safety of such substances. In addition, traditional sweeteners, such as honey which has been used for many years for this purpose, were not intended to be excluded from use in ice cream products by the suggested language that referred to the GRAS status of the sweetener (§ 170.30(d) 21 CFR 170.30(d)). Therefore, as discussed above, FDA is proposing to provide in § 135.110(a)(1) for the use of both nutritive and nonnutritive safe and suitable sweeteners in the standards set forth below.

FDA points out that another option is to retain the provision in § 135.110(a)(1) that requires the use of "nutritive carbohydrate sweeteners" as mandatory ingredients in ice cream and to allow ice cream products containing alternative sweeteners to be subject to the general standard of identity in new § 130.10, as has been done with other standardized foods. FDA notes, however, that new § 130.10(d)(4) of the general standard final rule requires that an ingredient that is specifically required by the standard (e.g., nutritive carbohydrate sweetener in ice cream) must be present in the product in a significant amount (i.e., at least that amount that is required to achieve the technical effect of that ingredient in the food). Thus, this option would prevent manufacturers from replacing all of the nutritive carbohydrate sweetener in such a product with one or more alternative sweeteners unless they called the product by a name other than the standardized name of the food.

The agency is requesting comments on the need for, and appropriateness of, the proposed change in § 135.110(a)(1) and proposed § 135.110(e)(7) with respect to the use of "safe and suitable sweeteners" in ice cream products as opposed to the general provision of new § 130.10.

One comment requested that the standards for ice cream products require that the artificial sweeteners used in these foods be declared on the principal display panel.

FDA recognizes that some consumers want to avoid frozen dessert products that contain the alternative sweeteners for which the standard of identity for ice cream does not now provide. In § 102.5 (21 CFR 102.5), FDA has established general principles for establishing common or usual names for

nonstandardized foods when the presence of a characterizing ingredient or component of an ingredient in such foods has a material bearing on consumer acceptance. However, there are no similar requirements for standardized foods unless specifically provided for in the standard of identity for a given food. FDA believes that ice cream made in compliance with § 135.110, but that is sweetened with an alternative sweetener, is a distinctly different product than that sweetened with a nutritive carbohydrate sweetener as the standard for this food now permits and accordingly should be clearly distinguished from the traditional food. Therefore, FDA tentatively concludes that it is necessary to inform consumers of this fact in sections 201(n) and 403(a) (21 U.S.C. 343) of the act. Under new § 130.10 in the general standard final rule, a product containing an alternative sweetener would be distinguished from the traditional product by naming the product using such nutrient content claims as "reduced sugar" defined in new § 101.60(c)(4) or "reduced calorie" defined in new § 101.60(b)(4), provided that the requirements for the use of these terms on the food label are otherwise met.

FDA also notes that foods that are sweetened with one or more artificial sweeteners, whether nutritive or nonnutritive, are foods for special dietary use under § 105.3(a)(2) (21 CFR 105.3(a)(2). Therefore, they must be labeled to comply with the requirements of § 105.66 (21 CFR 105.66). A final rule revising § 105.66 to conform with the requirements of the 1990 amendments is published elsewhere in this issue of the **Federal Register**. In accordance with new § 105.66, the food may be labeled with terms such as "diet," "dietetic," "artificially sweetened," or "sweetened with nonnutritive sweetener" only if the claim is not false or misleading to consumers, and the food is labeled "low calorie" or "reduced calorie" or bears another comparative caloric claim.

Therefore, to distinguish standardized ice cream products sweetened with alternative sweeteners (i.e., sweeteners other than nutritive carbohydrate sweeteners) from products sweetened with traditional sweeteners (i.e., nutritive carbohydrate sweeteners), FDA is proposing to add a requirement in the ice cream standard in proposed § 135.110(e)(7), and in the goat's milk ice cream standard in proposed § 135.115(c)(2), that the presence of such alternative sweeteners be declared by their common or usual name on the principal display panel of the label as part of the statement of identity in letters of no less than one-half the size of the type used in the product name (e.g., "ice cream") but no smaller than one-sixteenth of an inch.

FDA is also providing in these proposed provisions that, as discussed above, ice cream products sweetened with such sweeteners must comply with the applicable provisions of new § 105.66. Thus, in addition to having to declare the presence of alternative sweeteners as a part of their statements of identity, such products will have to be labeled as "low calorie" or "reduced calorie" or bear another comparative caloric claim in compliance with part 101. The agency notes that modified ice cream products made in conformity with the provisions of new § 130.10 in the general standard final rule will also have to comply with the labeling requirements for sweeteners if they are finalized as in proposed § 135.110(e)(7). New § 130.10(e) requires that the name of a modified version of a standardized food that complies with the general standard in new § 130.10 is the appropriate expressed nutrient content claim e.g., "reduced fat" and the applicable standardized term e.g., "ice cream sweetened with aspartame." The agency specifically requests comments on the need to declare alternative sweeteners in ice cream as discussed above.

C. Skim Milk with Part or All of the Lactose Removed by Alternate Technologies

One comment stated that recently developed technologies will permit increases in the amount of milk protein used in ice cream and related products without the quality problems normally associated with lactose in the dairy ingredients. To address the use of ultrafiltration and other lactose-reduction technologies, the comment requested that FDA revise § 135.110(b) to replace the phrase "skim milk that has been concentrated and from which part of the lactose has been removed by crystallization" with "skim milk [that] may be concentrated and from which part of the lactose has been removed by crystallization, ultrafiltration, or other approved technologies."

FDA tentatively finds that it would be appropriate for the standard to permit addition of concentrated skim milk from which part of the lactose has been removed by ultrafiltration. The agency believes that it should also provide for the removal of part or all of the lactose by any safe and suitable procedure. These actions will give manufacturers the opportunity to use state-of-the-art processing technologies. However, manufacturers must ensure that the nutritional quality of the resulting food is not detrimentally affected. Accordingly, FDA is amending the ice cream standard in proposed § 135.110(b) to provide for the addition of skim milk that may be concentrated, and from which part or all of the lactose has been removed by a safe and suitable procedure, in the food. This approach will minimize the need to revise the standard should other acceptable procedures be developed for lactose reduction or removal at a later date.

D. Goat's Milk Ice Cream and Goat's Milk Ice Milk

In the ANPRM, FDA asked whether the goat's milk ice cream and goat's milk ice milk standards of identity in §§ 135.115 and 135.125 should be amended to achieve consistency with any changes in the ice cream and ice milk standards of identity §§ 135.110 and 135.120. The goat's milk ice cream and goat's milk ice milk standards of identity cross-reference the ice cream and ice milk standards of identity with respect to the use of optional ingredients excluding caseinates, weight per gallon, weight of total food solids, and labeling requirements.

FDA received one comment from a consumer advocacy organization in support of changes in the goat's milk ice cream and goat's milk ice milk standards. The comment stated that, in the interest of consistency and for the same basic reasons given in the petitions, corresponding changes in the standards of identity for goat's milk ice cream and goat's milk ice milk should be proposed.

FDA agrees with this comment. The agency believes that the suggested actions relating to the standards for goat's milk ice milk and goat's milk ice cream will foster uniformity in the labeling of ice cream products. In addition, making changes in the standard for goat's milk ice cream in § 135.115 will permit this product to be formulated similarly to ice cream in § 135.110. Accordingly, the agency is proposing to remove the standard for goat's milk ice milk and to make changes in the standard for goat's milk ice cream similar to the proposed changes in the standard for ice cream and frozen custard, as discussed above.

E. Additional Comments

FDA received several comments on the use of "any safe and suitable dairy ingredient;" the use of safe and suitable milk-derived protein ingredients other than caseinates; the use of vegetable proteins; and the use of fat substitutes, such as microparticulated protein, in ice cream products. As discussed below,

FDA finds that the issues raised by these comments are appropriate for agency consideration. However, as a resource matter, given the demands of the formal rulemaking process, FDA concludes that it is not appropriate for the agency at this time to institute formal rulemaking procedures on most of these matters.

One comment requested that FDA revise § 135.110(b) to provide for "any safe and suitable dairy ingredient." It stated that the listing of optional dairy ingredients by name or by the process by which they are derived effectively prohibits the use of some new or novel materials (e.g., concentrated skim milk with the lactose removed by a process other than crystallization).

In view of the wide range of optional dairy ingredients listed by name or by the process by which they are derived in § 135.110(b) of the standard for ice cream, FDA requests comments on whether the specific names should be deleted from § 135.110(b), and whether the standard should be amended to provide for the use of any safe and suitable dairy ingredients, as suggested by the comment. If a comment supports use of a collective term such as "dairy ingredient," the agency asks that the comment provide a definition of the term so as to facilitate proper interpretation of the regulation.

One comment suggested that FDA provide for safe and suitable milk-derived protein ingredients other than caseinates where the milk solids content minimums required by the standard for ice cream in § 135.110 are otherwise met. The comment stated that these "other milk protein ingredients" include milk protein hydrolysates (enzyme-modified milk protein) and milk protein isolates (caseinates and whey protein co-isolates). The comment maintained that the use of milk proteins other than caseinates contributes to aeration of frozen lowfat dairy desserts, thereby improving the body and texture of these products, and that their use will not reduce the nutritional value of standardized dairy products. It further stated that these ingredients are safe and suitable for use in other nonstandardized foods such as frozen yogurt, coffee whiteners, infant formulas, fortified cereals, and medical foods. The comment requested that the standards proposed in the ANPRM be amended by replacing the optional caseinates with the term "safe and suitable milk-derived proteins."

FDA acknowledges that milk protein hydrolysates are GRAS and are now used in many foods. These hydrolysates vary in the degree of hydrolysis that they have undergone depending on the manufacturing process They also vary in their functional characteristics depending on their intended use. However, before the agency extends the category of milk-derived protein components that may be used in these foods, it would like additional information on the nature of and need for these ingredients in ice cream, the proposed levels of use, and their suitability in performing technical functions in the food, such as aeration, as suggested by the comment, as well as information on any possible adverse effects of their use. If the comments on this issue adequately support the need for such ingredients, FDA will consider providing for their use in the final regulation that results from this proposal.

One comment suggested that the standards provide for the addition of vegetable proteins in addition to milk-derived protein sources. It maintained that vegetable proteins could provide consumers and manufacturers with new nutritional, economic, and quality advantages in these products.

FDA does not agree that the standards for ice cream products should provide for the addition of vegetable proteins. Ice cream and ice milk products are traditionally considered to be dairy products, and, as such, neither vegetable proteins nor vegetable fats or oils are considered to be suitable ingredients of these foods. When vegetable proteins or vegetable fats or oils are used in frozen dessert products resembling ice cream, FDA considers these foods to be nonstandardized substitute foods provided that they are nutritionally equivalent to ice cream or ice milk. As such, these products should bear a common or usual name that is not misleading.

For example, coffee whiteners containing ingredients of vegetable origin do not purport to be cream or dry cream products. Rather, they are products that bear their own common or usual name. In a like manner, the agency believes that frozen dessert products, made in the semblance of ice cream and containing vegetable proteins or vegetable fats or oils, must be properly identified under their own common or usual name. Therefore, FDA is not providing for vegetable proteins in the proposed amendment of the standard of identity for ice cream set forth below. However, the agency notes that nonmilk-derived protein-containing ingredients may be included in frozen dessert products labeled as "mellorine" in § 135.130 (21 CFR 135.130).

One comment from an ingredient supplier asked whether fat substitutes, such as microparticulated protein, could be used in ice cream products. The comment stated that microparticulated protein, prepared from egg white and skim milk (or, alternatively, from whey protein concentrate), is used in products complying with the IICA proposed standards.

A comment from a consumer stated that fat substitutes do not belong in traditional ice cream products covered by standards of identity. The comment stated that these ingredients should be used only in the "frozen desserts" category. The comment contended that the preservation of tradition overrides governmental, medical, and consumer interests in reducing fat intake and providing alternative, healthful products.

FDA does not agree with the consumer comment in its entirety. FDA notes that § 135.110(a) provides for the use of "safe and suitable nonmilk-derived ingredients." In the Federal Register of April 12, 1977 (42 FR 19127), in an amendment of the standard for ice cream that provided for "safe and suitable nonmilk derived ingredients," the agency stated that it deems as unsuitable those ingredients that change the basic character of the food or that do not perform an appropriate function in the food. In this regard, the use of fat substitutes to replace milkfat in ice cream is suitable if the minimum compositional levels for milkfat and nonfat milk solids for ice cream in § 135.110(a)(2) are met, and if the fat substitutes are made from ingredients permitted by the standard of identity for ice cream. FDA believes that this approach is reasonable in order to give consumers the option to purchase products that simulate the characteristics of traditional ice cream but that contain less fat.

F. Summary of Proposal

On the basis of the information mentioned above, FDA is proposing to remove the standard of identity for ice milk (§ 135.120) and to make several requested changes in the standard of identity for ice cream. The requested changes in the ice cream standard deal with provisions for: (1) The use of safe and suitable sweeteners; and (2) the use of skim milk that may be concentrated, and from which part or all of the lactose has been removed by a safe and suitable procedure, in the food.

FDA considers it reasonable to propose to remove the standard of identity for ice milk because this action will allow for the use of the "reduced fat" nutrient content claim in conjunction with the name "ice cream." Such use will be consistent with the use of the terms "lowfat" and "nonfat" on ice cream products made in compliance

with new § 130.10. Until the ice milk standard has been removed, frozen desserts that have a milkfat content between 2 and 7 percent and that otherwise comply with the standard in § 135.120 cannot be called "reduced fat ice cream."

FDA also considers it reasonable to amend the standard of identity for ice cream to provide for the use of safe and suitable sweeteners, including alternative sweeteners such as aspartame or saccharin; and to allow for the use of skim milk that may be concentrated, and from which part or all of the lactose has been removed by any safe and suitable procedure, in ice cream. FDA tentatively finds that these changes will permit manufacturers to develop nutritious, wholesome frozen dessert products containing alternative sweeteners or sweetening systems. The proposed amendment of the ice cream standard will increase flexibility and give manufacturers the latitude to develop new, innovative products in response to consumer interest in and desire for lower calorie dairy products.

The goat's milk ice cream (§ 135.115) and goat's milk ice milk (§ 135.125) standards of identity cross-reference the ice cream and ice milk standards of identity. Thus, FDA considers it appropriate to propose comparable changes in the goat's milk ice cream and goat's milk ice milk standards to reflect the proposed changes in the ice cream and ice milk standards. Therefore, the agency is also proposing to remove the goat's milk ice milk standard and to amend the goat's milk ice cream standard with respect to the use of sweeteners and with respect to the use of skim milk with part or all of the lactose removed by any safe and suitable procedure as discussed above for the cross-referenced ice cream standard.

FDA is also making certain minor editorial changes in the standards of identity for ice cream and goat's milk ice cream for clarity.

FDA believes that these actions are necessary to ensure the integrity of these foods, to minimize any confusion regarding the types of acceptable ingredients that may be used in the foods, and to promote honesty and fair dealing in the interest of consumers.

V. Economic Impact

FDA has examined the economic implications of the proposed rule to remove the standards of identity for ice milk and goat's milk ice milk and to amend the standards of identity for ice cream and goat's milk ice cream in part 135 as required by Executive Order 12291 and the Regulatory Flexibility Act. Executive Order 12291 compels Federal agencies to use cost-benefit analysis as a component of decisionmaking. The Regulatory Flexibility Act requires regulatory relief for small businesses where feasible. Because no marginal costs are expected to be incurred to comply with this proposed regulation, the agency finds that this proposed rule is not a major rule as defined by Executive Order 12291. In accordance with the Regulatory Flexibility Act Pub. L. 96–354, FDA has also determined that this proposed rule will not have a significant adverse impact on a substantial number of small businesses.

FDA has tentatively determined that, because the effect of the actions that the agency is proposing is to permit increased flexibility in the processing of frozen desserts and because a reasonable amount of time will be provided to use existing supplies of labels, the proposed actions will not result in a significant impact on a substantial number of small entities. FDA has not received any information or comments on the ANPRM that would cause it to reach a different determination.

FDA considered several options in arriving at this proposal. One option considered was to take no action. Under this option, manufacturers of ice cream products would be limited in the types of skim milk ingredients that may be used in ice cream products. Thus, consumers' choices would also be limited. In addition, removal of the standard of identity for ice milk will provide for more informative labeling of the lower fat ice cream products and help consumers to achieve recommended nutritional goals.

Another option considered was to remove the ice cream standard and goat's milk ice cream standard, as well as the standards for ice milk and goat's milk ice milk, and allow manufacturers to use any combination of types and levels of ingredients in these foods. While this option would appear to provide flexibility in the selection of ingredients, it would not be in the best interest of consumers or manufacturers. In the absence of Federal standards for these foods, the states could establish standards with different requirements which could hinder interstate commerce. Uniform standards protect consumers from unfair trade practices and also enable manufacturers to compete in an equitable manner.

Under the selected option set forth below, i.e., removing the standard of identity for ice milk and amending the standard of identity for ice cream, as requested by the petitioners, as well as removing the goat's milk ice milk standard and amending the goat's milk ice cream standard that cross-references the ice cream standard, manufacturers will be able to provide consumers with ice cream products that reflect the traditional food and that are labeled in a uniform manner. In addition, the removal of the ice milk standard will provide manufacturers with increased flexibility to use names more acceptable to the public in designating ice cream products that contain reduced levels of calories and fat.

If FDA adopts this proposal, firms that produce ice milk products will have to revise their labels. Some firms may also wish to reformulate their ice milk products so as to be able to take advantage of the increased flexibility in product formulation provided for under new § 130.10. However, FDA believes that any additional costs for label changes will be offset by the increased consumer recognition of the benefits of the resulting reduced calorie and reduced fat ice cream products. FDA will also allow an appropriate period of time (1 year) for manufacturers to use up labels so as not to cause a hardship on manufacturers of ice milk products. The proposed amendments to the ice cream and goat's milk ice cream standards will also allow the use of additional optional ingredients. The agency does not anticipate that there will be any increased cost from these changes because there is no requirement that these new optional ingredients be used in ice cream products.

Therefore, FDA finds that marginal costs if any, will be small for the proposed amendment because FDA is providing sufficient time for most ice cream manufacturers to incorporate label changes into normal label stock reordering. Therefore, in accordance with section 605(b) of the Regulatory Flexibility Act, FDA has also determined that this proposed rule will not have a significant adverse impact on a substantial number of small businesses.

VI. Environmental Impact

The agency has determined under 21 CFR 25.24(b)(1) that this action is of a type that does not individually or cumulatively have a significant effect on the human environment. Therefore, neither an environmental assessment nor an environmental impact statement is required.

VII. Effective Date

FDA proposes that any final rule that may issue based on this proposal, unless stayed by the filing of proper objections, become effective 1 year following the date publication of the final rule in the

Federal Register. Because of the formal rulemaking procedures that apply to the amendment and removal of standards for products regulated under part 135, the agency notes that the effective date for any final rule that may issue from this proposal may not coincide with the effective date for the food labeling final rules that were issued in response to the 1990 amendments and that are published elsewhere in this issue of the Federal Register. Except as to any provisions that may be stayed by the filing of proper objections, compliance with any final rule that may issue based on this proposal (including any required labeling changes) may begin immediately upon publication of such a final rule in the Federal Register. Notice of the filing of objections or lack thereof will be published in the Federal Register.

VIII. References

The following information has been placed on file in the Dockets Management Branch (address above) and may be seen by interested persons between 9 a.m. and 4 p.m., Monday through Friday.

IX. Comments

Interested persons may, on or before March 8, 1993, submit to the Dockets Management Branch (address above) written comments regarding this proposal. Two copies of any comments are to be submitted, except that individuals may submit one copy. Comments are to be identified with the docket number found in brackets in the heading of this document. Received comments may be seen in the office above between 9 a.m. and 4 p.m., Monday through Friday.

List of Subjects in 21 CFR Part 135

Food grades and standards, Food labeling, Frozen foods, Ice cream.

Therefore, under the Federal Food, Drug, and Cosmetic Act and under authority delegated to the Commissioner of Food and Drugs and redelegated to the Director, Center for Food Safety and Applied Nutrition, it is proposed that 21 CFR part 135 be amended as follows:

PART 135—FROZEN DESSERTS

1. The authority citation for 21 CFR part 135 continues to read as follows:

Authority: Secs. 201, 401, 403, 409, 701, 706 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 341, 343, 348, 371, 376).

2. Section 135.110 is amended by revising paragraphs (a)(1) and (b), and by adding paragraph (e)(7) to read as follows:

§ 135.110 Ice cream and frozen custard.

(a) *Description.* (1) Ice cream is a food produced by freezing, while stirring, a pasteurized mix consisting of one or more of the optional dairy ingredients specified in paragraph (b) of this section, and may contain one or more of the optional caseinates specified in paragraph (c) of this section subject to the conditions hereinafter set forth, and other safe and suitable nonmilk-derived ingredients; and excluding other food fats, except such as are natural components of flavoring ingredients used or are added in incidental amounts to accomplish specific functions. Ice cream is sweetened with safe and suitable sweeteners and may or may not be characterized by the addition of flavoring ingredients.

* * * * *

(b) *Optional dairy ingredients.* The optional dairy ingredients referred to in paragraph (a) of this section are: Cream; dried cream; plastic cream (sometimes known as concentrated milkfat); butter; butter oil; milk; concentrated milk; evaporated milk; sweetened condensed milk; superheated condensed milk; dried milk; skim milk; concentrated skim milk; evaporated skim milk; condensed skim milk; superheated condensed skim milk; sweetened condensed skim milk; sweetened condensed part-skim milk; nonfat dry milk; sweet cream buttermilk; condensed sweet cream buttermilk; dried sweet cream buttermilk; skim milk, that may be concentrated, and from which part or all of the lactose has been removed by a safe and suitable procedure; skim milk in concentrated or dried form that has been modified by treating the concentrated skim milk with calcium hydroxide and disodium phosphate; and whey and those modified whey products (e.g., reduced lactose whey, reduced minerals whey, and whey protein concentrate) that have been determined by FDA to be generally recognized as safe (GRAS) for use in this type of food. Water may be added, or water may be evaporated from the mix. The sweet cream buttermilk and the concentrated sweet cream buttermilk or dried sweet cream buttermilk, when adjusted with water to a total solids content of 8.5 percent, has a titratable acidity of not more than 0.17 percent, calculated as lactic acid. The term "milk" as used in this section means cow's milk. Any whey and modified whey products used contribute, singly or in combination, not more than 25 percent by weight of the total nonfat milk solids content of the finished food. The modified skim milk, when adjusted with water to a total solids content of 9 percent, is substantially free of lactic acid as determined by titration with 0.1*N* NaOH, and it has a pH value in the range of 8.0 to 8.3.

* * * * *

(e) * * *

(7) When safe and suitable sweeteners other than nutritive carbohydrate sweeteners are used in the food, their presence shall be declared by their common or usual name on the principal display panel of the label as part of the statement of identity in letters that shall be no less than one-half the size of the type used in the term "ice cream" but in any case no smaller than one-sixteenth of an inch. Further, the use of such sweeteners in the food shall comply with the requirements of § 105.66 of this chapter.

* * * * *

3. Section 135.115 is amended by revising paragraph (a), by redesignating the text of paragraph (c) as paragraph (c)(1), and by adding new paragraph (c)(2) to read as follows:

§ 135.115 Goat's milk ice cream.

(a) *Description.* Goat's milk ice cream is the food prepared in the same manner prescribed in § 135.110 for ice cream, and complies with all the provisions of § 135.110, except that the only optional dairy ingredients that may be used are those in paragraph (b) of this section; caseinates may not be used; and paragraphs (e)(1) and (f) of § 135.110 shall not apply.

* * * * *

(c) * * *

(2) When safe and suitable sweeteners other than nutritive carbohydrate sweeteners are used in the food, their presence shall be declared by their common or usual name on the principal display panel of the label as part of the statement of identity in letters that shall be no less than one-half the size of the type used in the term "goat's milk ice cream" but in any case no smaller than one-sixteenth of an inch. Further, the use of such sweeteners in the food shall

comply with the requirements of § 105.66 of this chapter.

* * * * *

§ 135.120 [Removed]

4. Section 135.120 *Ice milk* is removed from subpart B.

§ 135.125 [Removed]

5. Section 135.125 *Goat's milk ice milk* is removed from subpart B.

Dated: October 23, 1992.

Fred R. Shank,

Director, Center for Food Safety and Applied Nutrition.

BILLING CODE 4160–01–F

DEPARTMENT OF COMMERCE

Patent and Trademark Office

37 CFR Part 1

[Docket No. 921118–2318]

RIN 0651–AA63

Patent Interference Practice Burden of Proof

AGENCY: Patent and Trademark Office, Commerce.

ACTION: Notice of proposed rulemaking.

SUMMARY: The Patent and Trademark Office (PTO) proposes to amend its rules of practice in patent interference cases. As a result of issues arising in some recent cases, it is apparent that parties in interference cases would be helped if the interference rules explicitly stated which party has the burden of proof when a motion is filed. There is also some confusion with respect to the nature of the evidence that should be submitted with a preliminary motion, particularly when testimony is needed to support or oppose the preliminary motion. PTO proposes to specify that a party filing a motion has the burden of proof. PTO also proposes to more clearly specify the nature of expert witness and factual witness evidence that must accompany a preliminary motion. Finally, PTO proposes to add a definition of an interlocutory order, as contrasted with a final decision, in order to clarify the meaning of an interlocutory order.

DATES: Comments must be submitted on or before March 8, 1993. A public hearing will not be held.

ADDRESSES: Address written comments to Box 8, Commissioner of Patents and Trademarks, Washington, DC 20231, marked to the attention of Fred E. McKelvey, Solicitor. Written comments will be available for public inspection in suite 918, on the 9th floor of Crystal Park II, located at 2121 Crystal Drive, Arlington, Virginia.

FOR FURTHER INFORMATION CONTACT: Fred E. McKelvey by telephone at (703) 305–9035 or by mail marked to his attention and addressed to Box 8, Commissioner of Patents and Trademarks, Washington, DC 20231.

SUPPLEMENTARY INFORMATION: The PTO conducts interference proceedings to determine who, as between two or more applicants for patent or one or more applicants and one or more patentees, is the first inventor of a patentable invention. In the course of interference proceedings, the Board of Patent Appeals and Interferences enters two kinds of decisions, interlocutory orders and final decisions. There has been some confusion as to what orders are interlocutory orders. The PTO is proposing to add subsection (q) to 37 CFR 1.601 to define an interlocutory order and to contrast interlocutory orders with the final decision. The presumption of correctness of an interlocutory order, which is presently in 37 CFR 1.655(a), is proposed to be moved to proposed new subsection 1.601(q), and to be deleted from § 1.655(a). The definition of interlocutory order would include the decision represented by the notice declaring the interference.

Under the interference rules, a party in an interference is authorized to file motions, including preliminary motions (37 CFR 1.633), motions to correct inventorship (37 CFR 1.634) and miscellaneous motions (37 CFR 1.635). When necessary, a preliminary motion should be accompanied by evidence (37 CFR 1.639). Recently there has been confusion as to who has the burden of proof when a motion is filed. For example, when transmitting papers to the Board for declaration of an interference, the Primary Examiner determines in the first instance the extent, if any, to which a party is entitled to the filing date of an earlier domestic or foreign application. 37 CFR 1.609(b)(4). The interference is then declared by an examiner-in-chief and an indication is given that a party has been accorded the benefit of the filing date of an earlier application. 37 CFR 1.611(c)(5). An opponent, however, is authorized to challenge the initial decision of the Primary Examiner and the examiner-in-chief to accord benefit. The challenge is made through a preliminary motion. 37 CFR 1.633(g). It is the PTO's position that the party filing the motion bears the burden of proof to show that its opponent should not have been accorded the benefit of the filing date of an earlier application. If adopted, the proposed rules would make explicit in 37 CFR 1.637(a) that a party filing a motion has the burden of proving why it is entitled to the relief sought in the motion.

Another difficulty in interference cases has been compliance with 37 CFR 1.639 with respect to evidence that must accompany a preliminary motion. In 1990, a decision was entered in *Hanagan* v. *Kimura*, 16 USPQ2d 1791, 1794 (Comm'r Pat. 1990), that provided the following guidance:

> To the extent it may prove useful, the following guidance is provided. When expert testimony is needed in support of, or in opposition to, a preliminary motion, a party should:
>
> (1) Identify the person whom it expects to call as an expert;
>
> (2) State the field in which the person is alleged to be an expert; and
>
> (3) State in a declaration signed by the person
>
> (a) the subject matter on which the person is expected to testify,
>
> (b) the facts and opinions to which the person is expected to testify, and
>
> (c) a summary of the grounds and basis for each opinion.
>
> If a person is to be called as a fact witness, a declaration by that person stating the facts should be filed.
>
> If the other party is to be called, or if evidence in the possession of the other party is necessary, an explanation of the evidence sought, what it will show, and why it is needed must be supplied.
>
> When inter partes tests are to be performed, a description of the tests stating what they will show must be presented.
>
> The nature of the showing under § 1.639(c) will vary from case to case.

Nothing in the rule change being proposed would alter the need to supply evidence in support of, or in opposition to, a preliminary motion. The rules being proposed would codify the *Hanagan* guidelines. Subsection (c) of § 1.639 is proposed to be amended to refer to "additional evidence in the form of testimony" so as to distinguish the evidence in the form of testimony" so as to distinguish the evidence needed under subsection (c) from that which may be submitted under subsections (a) and (b).

Proposed subsection (d) to 37 CFR 1.639 would specify the nature of evidence that must be submitted when an opinion of an expert is needed. The statement which would be required under proposed subsection (d) would be essentially the same as discovery required under Rule 26(b)(4)(A)(i) of the Federal Rules of Civil Procedures.

Proposed subsection (e) would specify the nature of evidence that must be

submitted when a statement of a fact witness is to be relied upon.

Proposed subsection (f) would specify the nature of a showing which should be made when a statement of an opponent is needed or evidence in possession of an opponent is needed.

Proposed subsection (g) would specify the nature of evidence that must be supplied if inter partes tests are to be conducted.

The party filing the preliminary motion would be expected to supply all necessary evidence with the preliminary motion. Likewise, a party opposing a preliminary motion should supply with the opposition all needed evidence in support of the opposition. Normally, if a party cannot obtain all necessary evidence to support or oppose a preliminary motion, and can show good cause, the party should seek an extension of time to file or oppose the preliminary motion. In an unusual situation, the guidance may not apply in the case of a party opposing a preliminary motion. In a recent interference, an examiner-in-chief deferred to final hearing consideration of a preliminary motion which had been accompanied by considerable evidence. The opponent had requested leave to take testimony. Based on the amount of evidence submitted with the preliminary motion, it was the examiner-in-chief's view that it would have been manifestly unfair to require the opponent to have prepared a full case in opposition to the preliminary motion in the 20-day period set for filing oppositions. As noted by the examiner-in-chief in the instance mentioned above, more leeway as to the evidence, and when it is supplied, can properly be granted to a party opposing a preliminary motion than a party filing a preliminary motion. The party filing the preliminary motion knows what must be proved. A party opposing the preliminary motion may or may not have time to fully respond with evidence accompanying an opposition. If an examiner-in-chief finds in a particular case that a party, during the time allowed for filing an opposition to a preliminary motion, could not reasonably have fully marshalled its evidence for presentation along with the opposition to a preliminary motion, a testimony period may be set. Alternatively, the examiner-in-chief, *sua sponte* or on motion of the opponent, may grant an extension of time to gather and supply the evidence. The action to be taken is a matter within the discretion of the examiner-in-chief.

Present 37 CFR 1.655(a) is proposed to be amended by deleting the last sentence, which would be moved to and be included in the proposed definition of interlocutory order in proposed subsection 1.601(q). The burden of showing error in entry of an interlocutory order is on the party challenging the order. If the order involved a procedural matter, the challenger must show that an examiner-in-chief or a panel abused discretion in entering the order. If the order involved a non-procedural matter (i.e., granting a motion for judgment based on unpatentability), the challenger must show legal error.

In some instances, two or more interlocutory orders may involve the same issue. For example, a notice declaring an interference may accord a party benefit of an earlier application. A preliminary motion may result in the party being denied benefit. When there are two or more interlocutory orders involving the same issue, the latest interlocutory order is presumed to be correct in further proceedings in the interference.

Other Considerations

The proposed rule changes are in conformity with the requirements of the Regulatory Flexibility Act (5 U.S.C. 601 *et seq.*), Executive Orders 12291 and 12612 and the Paperwork Reduction Act of 1980, 44 U.S.C. 3501 *et seq.*

The General Counsel of the Department of Commerce has certified to the Chief Counsel for Advocacy, Small Business Administration, that these proposed rule changes will not have a significant economic impact on a substantial number of small entities (Regulatory Flexibility Act, 5 U.S.C. 605(b)). The principal impact of these proposed changes would be to clarify procedure in patent interference and thereby eliminate any ambiguity which might exist in current rules.

The Office has determined that this proposed rule change is not a major rule under Executive Order 12291. The annual effect on the economy will be less than $100 million. There will be no major increase in costs or prices for consumers; individuals; industries; Federal, state or local government agencies; or geographic regions. There will be no significant effects on competition, employment, investment, productivity, innovation, or on the ability of United States-based enterprises to compete with foreign-based enterprises in domestic or export markets.

The Office has also determined that this notice has no Federalism implications affecting the relationship between the National Government and the States as outlined in Executive Order 12612.

The rule change will not impose a burden under the Paperwork Reduction Act of 1980, 44 U.S.C. 3501 *et seq.*, since no recordkeeping or reporting requirements within the coverage of the Act are placed upon the public.

List of Subjects in 37 CFR Part 1

Administrative practice and procedure, Courts, Inventions and patents.

PART 1—RULES OF PRACTICE IN PATENT CASES

For the reasons set out in the preamble, it is proposed to amend 37 CFR part 1 wherein removals are indicated by brackets ([ ]) and additions by arrows (⧫ ⧫):

1. The authority citation for 37 CFR part 1 would continue to read as follows:

Authority: 35 U.S.C. 6, unless otherwise noted.

2. Section 1.601 is proposed to be amended by adding paragraph (q) to read as follows:

§ 1.601 Scope of rules, definitions.

* * * * *

⧫(q) A *final decision* is a decision awarding judgment as to all counts. An *interlocutory order* is any other action taken by an examiner-in-chief or a panel of the Board in an interference, including the notice declaring an interference. All interlocutory orders shall be presumed to have been correct and the burden of showing error or an abuse of discretion shall be on the party attacking the order. When two or more interlocutory orders involve the same issue, the last entered order shall be presumed to have been correct.⧫

3. Section 1.637 is proposed to be amended by revising paragraph (a) to read as follows:

§ 1.637 Content of motions.

(a) ⧫A party filing a motion has the burden of proof to show that it is entitled to the relief sought in the motion.⧫ Every motion shall include (1) a statement of the material facts in support of the motion, and (3) a full statement of the reasons why the relief requested should be granted.

* * * * *

4. Section 1.639 is proposed to be amended by revising paragraph (c) and by adding paragraphs (d) through (g) as follows:

§ 1.639 Evidence in support of motion, opposition, or reply.

* * * * *

(c) When a party believes that ⧫additional evidence in the form of⧫

testimony is necessary to support or oppose a preliminary motion under § 1.633 or a motion to correct inventorship under § 1.634, the party shall describe the nature of any proposed testimony ◗in the manner specified in subsections (d) through (g) of this section◖. If the examiner-in-chief finds that testimony is needed to decide the motion, the examiner-in-chief may grant appropriate interlocutory relief and enter an order authorizing the taking of testimony and deferring a decision on the motion to final hearing.

◗(d) When the testimony is needed in support of or opposition to a preliminary motion is expert testimony, the moving party or opponent should:

(1) Identify the person whom it expects to call as an expert;

(2) State the field in which the person is alleged to be an expert; and

(3) State:

(i) The subject matter on which the person is expected to testify;

(ii) The facts and opinions to which the person is expected to testify; and

(iii) A summary of the grounds and basis for each opinion.

(e) If a fact witness is to be relied upon, state the facts to which the witness will testify.

(f) If the opponent is to be called, or if evidence in the possession of the opponent is necessary, explain the evidence sought, what it will show, and why it is needed.

(g) When inter partes tests are to be performed, describe the tests stating what they will be expected to show.◖

5. Section 1.655 is proposed to be amended by removing the last sentence of paragraph (a) as follows:

§ 1.655 Matters considered in rendering a final decision.

(a) In rendering a final decision, the Board may consider any properly raised issue including (1) priority of invention, (2) derivation by an opponent from a party who filed a preliminary statement under § 1.625, (3) patentability of the invention, (4) admissibility of evidence, (5) any interlocutory matter deferred to final hearing, and (6) any other matter necessary to resolve the interference. The Board may also consider whether any interlocutory order was erroneous or an abuse of discretion. (All interlocutory orders shall be presumed to have been correct and the burden of showing manifest error or an abuse of discretion shall be on the party attacking the order.)

FEDERAL COMMUNICATIONS COMMISSION

47 CFR Part 43

[CC Docket No. 92–296; FCC 92–537]

Simplification of the Depreciation Prescription Process

AGENCY: Federal Communications Commission.

ACTION: Proposed rule.

SUMMARY: The Federal Communications Commission (the Commission) has adopted a Notice of Proposed Rulemaking (Notice) proposing to simplify its depreciation prescription process. In a continuing effort to reduce unnecessary regulatory burdens and their associated costs, the Commission seeks comment on proposals that would simplify procedures and reduce associated costs in the depreciation prescription process.

DATES: Comments must be filed on or before March 10, 1993 and reply comments must be filed on or before April 13, 1993.

ADDRESSES: Federal Communications Commission, 1919 M St., NW., Washington, DC 20554.

FOR FURTHER INFORMATION CONTACT: Sonja J. Rifken or Fatina K. Franklin, Common Carrier Bureau, Accounting and Audits Division, (202) 632–7500.

SUPPLEMENTARY INFORMATION: This is a summary of the Commission's Notice of Proposed Rulemaking in Simplification of the Depreciation Prescription Process, CC Docket No. 92–296, FCC 92–537, adopted December 10, 1992 and released December 29, 1992. The full text of this Commission decision is available for inspection and copying during normal business hours in the FCC Dockets Branch (room 230), 1919 M St., NW., Washington, DC. The full text will be published in the FCC Record and may also be purchased from the Commission's copy contractor, Downtown Copy Center, (202) 452–1422, 1990 M Street, NW., suite 640, Washington, DC 20036.

Summary

1. In this Notice of Proposed Rulemaking (Notice), we continue our efforts to reduce unnecessary regulatory burdens and their associated costs by undertaking simplification of our depreciation prescription process. Under our current depreciation prescription process, we prescribe depreciation rates by plant account for individual carriers. In this Notice, we seek comment on proposals that would simplify procedures and reduce associated costs in our depreciation prescription process.

2. This Commission determines depreciation rates by using a formula. This formula contains two parameters which must be estimated: future net salvage (FNS) and average remaining life (ARL). Once the parameters are determined, a depreciation rate is computed. The carriers then apply the depreciation rate to the average plant account balance to calculate the depreciation expense for that account. The ultimate purpose of continually estimating depreciation rates is to develop rates, using the most current information, that most accurately allocate plant costs to expense at a rate representative of the actual consumption of the plant.

3. Because the basic factors composing the ARL, projection life and survivor curve, as well as the FNS, are estimates, they are the subject of detailed analyses. Carriers submit detailed studies to prove the merit of their estimates, as required by our rules. A typical carrier submits studies totalling approximately 600 pages and averaging 20–25 pages of analysis per account. It is this part of the depreciation process we seek to simplify in this Notice.

4. In this Notice, we propose four options for simplifying the determination of depreciation expense: the basic factor range option, the range of rates option, the depreciation schedule option, and the price cap carrier option. The first proposal, the basic factor range option, would simplify the depreciation process by establishing ranges for the basic factors that determine the parameters used in the depreciation rate formula; the FNS, and the projection life and survivor curve (the basic factors that determine the ARL). This would eliminate the need for carriers to submit detailed studies in support of their proposed factors. Under this proposal, we would continue to prescribe depreciation rates using the current depreciation rate formula. Carriers would then apply the rates to their plant account balances to determine their depreciation expense.

5. The second proposal, the range of rates options, would simplify the depreciation process by establishing ranges for depreciation rates. Under this option, we would no longer focus on the basic factors used to derive the

parameters for the depreciation rate formula, and more importantly, we would not use the depreciation rate formula to derive depreciation rates. However, carriers would continue to apply depreciation rates to their plant account balances to determine their depreciation expense.

6. The third proposal, the depreciation schedule option, would simplify the depreciation process by establishing a depreciation schedule for each plant account. Essentially, the schedule would be based upon a Commission-specified service life, retirement pattern, and salvage value for a particular account. Carriers would then apply the schedule to their investment by vintage.

7. The final proposal would affect only price cap carriers. The price cap carrier option would simplify the depreciation process by allowing price cap carriers to file depreciation rates with no supporting data, but continuing Commission prescription of depreciation rates. Price cap carriers would file their proposed depreciation rates, and the Commission would issue a Public Notice seeking comment on the proposed rates. The Commission would then prescribe depreciation rates based on the price cap carriers' proposals and the comments submitted thereon.

8. The current depreciation process, and the four simplification options we seek comment on, include net salvage as a part of the depreciation process. In furtherance of simplification, we seek comment on whether we should, independent of those options, change our approach to salvage and not consider it in the depreciation process. This simplification option would require carriers to remove salvage from their depreciation process and require them to book the cost of removal and salvage as current period charges and credits. In addressing this proposal, commenters should quantify the effects this change would have on carriers' income statement and the administrative costs savings associated with the change. Also, we ask whether this changed treatment of salvage would be contrary to Generally Accepted Accounting Principles (GAAP).

9. We certify that the Regulatory Flexibility Act of 1980 does not apply to this rulemaking proceeding because if the proposed rule amendments are promulgated, there will not be a significant economic impact on a substantial number of small business entities, as defined by Section 601(3) of the Regulatory Flexibility Act. 5 U.S.C. 603(a). Because of the nature of local exchange and access service, the Commission has concluded that small telephone companies are dominant in their fields of operation and therefore are not "small entities" as defined by that act. The Secretary shall send a copy of this Notice of Proposed Rulemaking, including the certification, to the Chief Counsel for Advocacy of the Small Business Administration in accordance with section 603(a) of that act.

10. Accordingly, it is ordered that, pursuant to sections 1, 4(i), 4(j), 220, and 403 of the Communications Act of 1934, as amended, 47 U.S.C. 151, 154(i), 154(j), 220(b), and 403, notice is hereby given of proposed amendments to § 43.43 of the Commission's Rules, 47 CFR 43.43 as described in this Notice of Proposed Rulemaking.

INTERSTATE COMMERCE COMMISSION

49 CFR Part 1007

[Ex Parte No. 514(B)]

Privacy Act: New System of Records—Exemption; Office of Inspector General Complaint and Investigative Files

AGENCY: Interstate Commerce Commission.

ACTION: Proposed rule.

SUMMARY: The Commission (ICC) proposes here to exempt a new system of records due to the law enforcement nature of those records. That system of records which the Commission today proposed to establish in another proceeding under the Privacy Act of 1974, as amended (5 U.S.C. 552a), will consist of the complaint and investigatory files of the ICC's Office of Inspector General (OIG). This proposed rule amendment is required in order to invoke the relevant exemptions. By relieving the OIG of certain restrictions, the exemption will help ensure that the OIG may efficiently and effectively perform investigations and other authorized duties and activities.

DATES: Comments are due February 5, 1993.

ADDRESSES: An original and two copies of comments, referring to Ex Parte No. 514(B), should be submitted to: Office of the Secretary, Case Control Branch, Interstate Commerce Commission, Washington, DC 20423.

FOR FURTHER INFORMATION CONTACT: S. Arnold Smith, Freedom of Information/Privacy Officer, (202) 927–6317 [TDD for hearing impaired: (202) 927–5721].

SUPPLEMENTARY INFORMATION: In the notice section of today's **Federal Register**, the ICC is publishing a notice proposing to establish a new system of records, "Office of Inspector General Complaint and Investigative Files," under the Privacy Act, as amended, 5 U.S.C. 552a. The following proposed amendment of ICC Rule 49 CFR 1007.12 is necessary to exempt the new system of records from certain provisions of the Act. These provisions require, among other things, that the ICC provide notice when collecting information, account for certain disclosures, permit individuals access to their records, and allow them to request that the records be amended. These provisions would interfere with the conduct of OIG investigations if applied to the OIG's maintenance of the proposed system of records.

Accordingly, the ICC proposes to exempt the system of records under sections (j)(2) and (k)(2) of the Privacy Act. Section (j)(2), 5 U.S.C. 552a(j)(2), exempts a system of records maintained by "the agency or component thereof which performs as its principal function any activity pertaining to enforcement of criminal laws * * *" Section (k)(2), 5 U.S.C. 552a(k)(2), exempts a system of records consisting of "investigatory materials compiled for law enforcement purposes," where such materials are not within the scope of the (j)(2) exemption pertaining to criminal law enforcement.

Where applicable, section (j)(2) may be invoked to exempt a system of records from any Privacy Act provision except: 5 U.S.C. 552(b) (conditions of disclosure); (c) (1) and (2) (accounting of disclosures and retention of accounting, respectively); (e)(4) (A) through (F) (system notice requirements); (e) (6), (7), (9), (10), and (11) (certain agency requirements relating to system maintenance); and (i) (criminal penalties). Section (k)(2) may be invoked to exempt a system of records from 5 U.S.C. 552(c)(3) (making accounting of disclosures available to the subject individual); (d) (access to record); (e)(1) (G), (H) and (I) (notice of certain procedures); and (f) (promulgation of certain Privacy Act rules).

The proposed system of records consists of information covered by the (j)(2) and (k)(2) exemptions. The OIG complaint and investigatory files are maintained pursuant to official

investigatory and law enforcement functions of the ICC's OIG under the authority of the Inspector General Act Amendments of 1988, Public Law 100–504, 102 Stat. 251 (amending 5 U.S.C. App. 3 (1978)). Furthermore, the OIG constitutes an ICC component that performs as one of its principal functions activities pertaining to the enforcement of criminal laws. See 5 U.S.C. 552a(j)(2). Information covered under the (j)(2) exemption includes, but is not limited to, information compiled for the purpose of identifying criminal offenders and alleged offenders and consisting of identifying data and notations of arrests, and the nature and disposition of criminal charges, sentencing, confinement, release, and parole and probation status; information compiled for the purpose of a criminal investigation, including reports of informants and investigators, that is associated with an identifiable individual; or reports of enforcement of the criminal laws from arrest or indictment through release from supervision. Information contained in OIG complaint and investigative files under the (k)(2) exemption relates to non-criminal law enforcement matters, such as information pertaining to the investigation of civil, administrative, or regulatory violations and similar wrongdoing.

Access by subject individuals, among others, to this system of records; including the names of persons or agencies to whom the information has been transmitted, would substantially compromise the effectiveness of OIG investigations. Knowledge of such investigations could enable suspects to take action to prevent detection of unlawful activities, conceal or destroy evidence, or escape prosecution. Disclosure of this information could lead to the intimidation of, or harm to, informants, witnesses, and their families and could jeopardize the safety and well-being of investigative and related personnel and their families. The imposition of certain restrictions on the manner in which investigative information is collected, verified, or retained would significantly impede the effectiveness of OIG investigatory activities and, in addition, could preclude the apprehension and successful prosecution or discipline of persons engaged in fraud or other illegal activity.

For these reasons, the ICC proposes to exempt the proposed system of records containing the OIG complaint and investigative files under exemptions (j)(2) and (k)(2) of the Privacy Act by amending 490 CFR 1007.12. Under this rule, the ICC specifies its system of records that are exempt from the Privacy Act.

This proposed rule amendment will become effective 30 days after its final publication in the **Federal Register**. This date may be postponed if the Director of the Office of Management and Budget (OMB) declines, in whole or part, the ICC's request to waive the 60-day period prescribed by OMB for advance notice to OMB and Congress. See OMB Circular No. A–130, App. 1 at 4b.(c)(4).

Regulatory Flexibility Certification

Pursuant to the Regulatory Flexibility Act (RFA), 5 U.S.C. 605(b), the Commission certifies that the proposed amendment to its regulations, if adopted, would not have a significant economic impact on a substantial number of small entities within the meaning of the RFA. The purpose of that amendment, which is proposed pursuant to the Privacy Act, is solely to exempt from disclosure certain files of the ICC's OIG that would be kept in a new system of records within the ICC. The proposed amendment imposes no new regulatory requirements either directly or indirectly on anyone, including small entities. Moreover, because the Privacy Act applies only to "individuals," and the RFA defines "small entities" as having the same meaning as 'small business', 'small organization' and 'small government jurisdiction' as defined in section 601(3), (4) and (5) respectively, the "individuals" who may be affected by the new rule do not appear to come within the meaning of "small entity" as defined by the RFA.

Energy and Environment Considerations

We preliminarily conclude that this action will not significantly affect either the quality of the human environment or the conservation of energy resources.

List of Subjects in 49 CFR Part 1007

Administrative practice and procedure, Privacy.

Decided: December 31, 1992.

By the Commission, Chairman Philbin, Vice Chairman McDonald, Commissioners Simmons and Phillips.

Sidney L. Strickland, Jr.,

Secretary.

For the reasons set forth in the preamble, title 49, chapter X, part 1007 of the Code of Federal Regulations is proposed to be amended as follows:

PART 1007—RECORDS CONTAINING INFORMATION ABOUT INDIVIDUALS

1. The authority citation for part 1007 continues to read as follows:

Authority: 5 U.S.C. 552, 553, and 559.

2. Section 1007.12 is proposed to be amended by adding a new paragraph (c) as follows:

§ 1007.12 Exemptions.

* * * * *

(c) Complaints and investigatory materials compiled by the Commission's Office of Inspector General are exempt from the provisions of 5 U.S.C. 552a and the regulations in this part, pursuant to 5 U.S.C. 552a(j)(2), except subsections (b), (c)(1) and (2), (e)(4) (A) through (F), (e)(6), (7), (9), (10), and (11) and (i) to the extent that the system of records pertains to the enforcement of criminal laws. Complaint and investigatory materials compiled by the Commission's Office of Inspector General for law enforcement purposes also are exempt from the provisions of 5 U.S.C. 5552a and the regulations of this part, pursuant to 5 U.S.C. 552a(k)(2), except subsections (c)(3), (d), (e)(1), (e)(4)(G), (H), (I), and (f).

DEPARTMENT OF COMMERCE

National Oceanic and Atmospheric Administration

50 CFR Part 672

[Docket No. 921226–2326]

Groundfish of the Gulf of Alaska

AGENCY: National Marine Fisheries Service (NMFS), NOAA, Commerce.

ACTION: Proposed rule; request for comments.

SUMMARY: NMFS proposes to delay the opening of the second quarter for pollock fishing in the Combined Western and Central Regulatory Areas (W/C) of the Gulf of Alaska (GOA) from the beginning of the second quarterly reporting period (around April 1) until the first day of the weekly reporting period closest to June 1. This action is necessary to increase revenues from the GOA pollock harvest by avoiding a second quarter directed fishery at a time when pollock have recently spawned and flesh yield is low. Additionally, NMFS anticipates this action would reduce discards of undersized pollock, and of incidental bycatch amounts of chinook salmon in the pollock fishery.

By increasing the value of the pollock harvest, this action would foster economic growth. This action is intended to promote the goals and objectives of the North Pacific Fishery Management Council (Council) with respect to groundfish management off Alaska.

DATES: Comments must be received at the following address no later than 4:30 p.m., Alaska local time, February 5, 1993.

ADDRESSES: Comments may be sent to Ronald J. Berg, Chief, Fisheries Management Division, Alaska Region, NMFS, Box 21668, Juneau, AK 99802, Attention: Lori Gravel. Copies of the environmental assessment/regulatory impact review/initial regulatory flexibility analysis (EA/RIR/IRFA) prepared for the proposed action may be obtained from the same address.

FOR FURTHER INFORMATION CONTACT: Jessica A. Gharrett, Fisheries Management Division, (907) 586–7229.

SUPPLEMENTARY INFORMATION:

Background

The domestic and foreign groundfish fisheries in the exclusive economic zone of the GOA are managed by the Secretary of Commerce (Secretary) under the Fishery Management Plan for Groundfish of the GOA (FMP). The FMP was prepared by the Council under the Magnuson Fishery Conservation and Management Act (Magnuson Act) and is implemented by regulations for the foreign fishery at 50 CFR Part 611 and for the U.S. fishery at 50 CFR part 672. General regulations that also pertain to the U.S. fishery appear at 50 CFR part 620.

Under regulations at § 672.20(a)(2)(iv), the total allowable catch (TAC) for pollock in the W/C GOA is apportioned among statistical areas Shumagin (61), Chirikof (62), and Kodiak 63 in proportion to known distribution of the pollock biomass. Each apportionment is divided equally into the four quarterly reporting periods of the fishing year. Under § 672.2, a "quarterly reporting period" means one of four successive 3-month periods during a calendar year. Under § 672.20(c)(1)(ii)(A), directed fishing for pollock in the W/C GOA will commence on dates that coincide with anticipated quarterly reporting periods for 1993. Pollock fishing quarters in the W/C GOA for 1993 commence on the first day of each of the four quarterly reporting periods: January 1, March 29, June 28, and October 4.

At its September 22–27, 1992, meeting, the Council considered an industry proposal to delay the opening of the second quarter pollock fishery in the W/C GOA from the first day of the second quarterly reporting period until the first day of the weekly reporting period nearest June 1. Under § 672.2, a "weekly reporting period" means from 0001 hours Monday morning until 2400 hours the following Sunday night, Alaska local time. For the 1993 fishing year, this date falls on May 31. For the reason given below, the Council found the industry proposal would provide economic benefits to pollock harvesters and processors and recommended that NMFS prepare a proposed rule delaying the opening of the second quarter pollock fishery in the W/C GOA. Pending approval by NMFS, this action would be implemented prior to the start of the second 1993 W/C GOA pollock quarter, currently scheduled for March 29.

The most recent year in which a W/C GOA directed pollock fishery occurred in April was 1990; in 1991 and 1992, the opening of the second quarter was delayed until June. In 1991, the second quarter directed pollock fishery commence on June 13. This change was the result of a delay in approval of the pollock harvest specification to complete additional analyses and a Section 7 consultation for Steller sea lions under the Endangered Species Act (ESA) (56 FR 28112, June 19, 1991). In 1992, the opening of the second quarter was delayed until June 1, under an emergency rule (57 FR 11272, April 2, 1992). This emergency rule was intended to prevent preemption of the inshore component by the offshore component until allocations of pollock under a final rule implementing Amendment 23 to the FMP were effective (57 FR 23321, June 3, 1992). Adoption of this proposed rule would maintain the second quarter pollock fishing and processing seasons as they occurred in 1993 and 1992.

The allocation of pollock into quarters and among several areas has resulted in small quarterly pollock allowances for pollock. Because the domestic groundfish industry has more than adequate capacity to harvest and process the pollock TAC in the W/C GOA, the resultant directed fishery is of short duration; the number of days directed fishing for pollock was open during the second quarter in 1992 was: 2 days for area 61; 16 days for area 62; and 11 days for area 63. This proposed delay is not anticipated to alter effort, and would not be likely to change the length of the directed fishery. The opening of the second quarter directed fishery for pollock would be displaced by approximately 2 months, from the beginning of April to the beginning of June. The opening of the third pollock quarter in the W/C GOA would not be altered by this proposed rule.

The allocation of the W/C GOA pollock TAC to 3 areas will ensure that the harvest remains distributed spatially. Harvesters may be able to fish closer to ports and make shorter trips if searching time to avoid encounters with young and undersized pollock is reduced, and if pollock are not as dispersed as they are in early spring just after spawning.

If the opening of the second quarter pollock fishery is delayed, the same individuals would likely participate in the harvesting and processing of GOA pollock as in 1992, including some processors in close proximity to the Bering Sea and Aleutian Islands Area (BSAI) who also participate in BSAI pollock fisheries. GOA pollock harvesters and processors who participate both in the pollock fishery and in June salmon fisheries may not be able to participate fully in the second quarter fishery if the opening is delayed until June. Participation would depend on the starting dates of the salmon fisheries. In 1992, operators of more than 300 vessels held Federal groundfish permits for trawl gear in the GOA. While this number of vessels is considered substantial, this regulatory measure would only affect the portion of the fleet that participates in the second quarter pollock fishing season. processors who intend to participate in fisheries for pollock as well as other species in the second quarter may experience labor and/or equipment conflicts. These costs, or the extent to which pollock fishing would be foregone, are not quantifiable at this time. Although some processing operations may incur additional labor costs, most operators would realize net benefits resulting from increased yields.

Delaying the opening of the second quarter pollock fishery could result in a fishery that is conducted with pelagic, rather than with non-pelagic, trawl gear, although no additional costs to the industry are anticipated. Under § 672.20(f), an annual halibut bycatch limit is specified for trawl gear. When the limit, or seasonal apportionment thereof, is reached, all GOA groundfish trawl fisheries are closed with the exception of trawling for pollock with pelagic trawl gear. Delay of the opening of the second quarter pollock fishery to around June 1 would increase the likelihood that a seasonable trawl bycatch allowance is taken in other trawl fisheries prior to the start of the second quarter pollock fishery. This situation occurred in the past 2 years and, because trawl closures typically occur in other seasons as well, many

pollock fishermen have acquired pelagic trawl gear. Therefore, any additional costs to harvesters to purchase pelagic nets under the proposed rule are expected to be minimal.

NMFS anticipates that under this proposed action, pollock fishery conducted with pelagic trawl gear would accrue negligible amounts of additional halibut bycatch. Any savings in halibut bycatch experienced by the pollock fishery because of a prohibition on the use of non-pelagic trawl gear may support additional catches of other groundfish species during the second quarter and result in a higher overall groundfish harvest.

NMFS also anticipates that a delayed opening of the second quarter pollock fishery could result in a substantial decrease in the bycatch rates of chinook salmon. Data from 1991 and 1992 indicate that bycatch rates (number of salmon/metric ton (mt) of groundfish) in the pelagic trawl pollock fishery are significantly lower in June than at the end of the first quarter (0.02 and 0.20, respectively). In contract, bycatch rates for salmon other than chinook salmon and for herring may be higher. Bycatch rates of crabs in June are very low and would likely not be different from earlier in the quarter.

The proposed delay of the second quarter opening is anticipated to increase the first wholesale value of the pollock harvest during the second quarter by allowing harvest when recovery of flesh is higher, and to result in potentially higher value products, such as larger fillets and higher grades of surimi. Because the amount of pollock harvest would not be altered under the proposed season delay, an estimate of the increased value is dependent on improved yields, product mix, and wholesale prices. Information on product recovery rates indicates that the increase in flesh yield between pollock harvested in April, when fish have recently spawned, and June, is about 3 percent for fillets, and 4 percent for surimi. Based on 1991 first wholesale values, the value increase would likely be between $2.6 million and $3.6 million for 1993. In addition to increased product value, harvesters and processors also would benefit from decreased fishing, sorting, processing, and storage time, and from decreased disposal of unsuitable fish.

NMFS preliminarily concurs with the Council's recommendation and proposes to delay the opening of the second quarter pollock fishery until the first day of the weekly reporting period nearest June 1.

Classification

The Assistant Administrator for Fisheries, NOAA (Assistant Administrator), has initially determined that this rule is necessary for the conservation and management of the groundfish fishery off Alaska and that it is consistent with the Magnuson Act and other applicable law.

NMFS prepared an EA for this proposed rule that discusses the impact on the environment as a result of this rule. The public may obtain a copy of the EA from the Regional Director (see **ADDRESSES**).

The Assistant Administrator determined that this proposed rule is not a "major rule" requiring a regulatory impact analysis under Executive Order 12291. This determination is based on the socioeconomic impacts discussed in the EA/RIR/IRFA prepared by the NMFS. This proposed rule, if adopted, is not likely to result in an annual effect on the economy of $100 million or more; a major increase in costs or prices for consumers, individual industries, Federal, State, or local government agencies, or geographic regions; or a significant adverse effect on competition, employment, investment, productivity, innovation, or the ability of U.S.-based enterprises to compete with foreign-based enterprises in domestic or export markets.

NMFS prepared an IRFA that concludes that this proposed rule, if adopted, would have significant effects on small entities. In 1992, operators of over 300 vessels were issued permits to fish for GOA groundfish with trawl gear. While this number of vessels is considered substantial, this regulatory measure would affect only the portion of the fleet that participates in the second quarter pollock fishing season. In addition, 14 processors processed pollock during the second quarter pollock fishing of 1992. The proposed action to delay the opening of the second quarter pollock fishery in the W/C GOA is superior to the status quo alternative, because economic benefits will be gained by allowing harvest of pollock when flesh recovery is improved in June as opposed to April. Based on 1991 first wholesale prices, the value increase under the proposed rule is estimated to be between $2.6 and $3.6 million for 1993. Additionally, costs to harvesters and processors may be lower due to decreased time required for fishing, sorting, processing, and product storage. The bycatch and discard of young and undersized pollock, and of chinook salmon, are likely to be lower. Conservation of groundfish and salmon resources would be improved to the extent that these bycatch rates would be reduced. A copy of this analysis is available from the Regional Director (see **ADDRESSES**).

This rule does not include a collection-of-information requirement subject to the Paperwork Reduction Act.

Pursuant to the requirements of the ESA, the Regional Director has determined that this action is not likely to adversely affect any endangered or threatened species or critical habitat within NMFS' jurisdiction.

NFMS has determined that this rule will be implemented in a manner that is consistent to the maximum extent practicable with the approved coastal management program of the State of Alaska. This determination has been submitted for review by the responsible State agency under Section 307 of the Coastal Zone Management Act.

This proposed rule does not contain policies with federalism implications sufficient to warrant preparation of a Federalism Assessment under E.O. 12612.

List of Subjects in 50 CFR Part 672

Fisheries, Reporting and recordkeeping requirements.

Dated: December 30, 1992.

Samuel W. McKeen,

Acting Assistant Administrator for Fisheries, National Marine Fisheries Service.

For the reasons set out in the preamble, 50 CFR part 672 is proposed to be amended as follows:

PART 672—GROUNDFISH OF THE GULF OF ALASKA

1. The authority citation for 50 CFR part 672 continues to read as follows:

Authority: 16 U.S.C. 1801 *et seq.*

2. In § 672.23, paragraph (a) is revised and a new paragraph (f) is added to read as follows:

§ 672.23 Seasons.

(a) Fishing for groundfish in the regulatory areas and districts of the Gulf of Alaska is authorized from 00:01 a.m., Alaska local time (A.l.t), January 1, through 12 midnight, A.l.t., December 31, subject to the other provisions of this part, except as provided in paragraphs (c) through (f) of this section

* * * * *

(f) Directed fishing for pollock in the Western and Central Regulatory Areas of the Gulf of Alaska is authorized from 12 noon, A.l.t., on the first day of each quarterly reporting period through the end of that quarterly reporting period, subject to other provisions of this part, except that directed fishing for pollock during the second quarterly reporting

period is authorized from 12 noon, A.l.t., on the first day of the weekly reporting period closest to June 1, through the end of the second quarterly reporting period, subject to other provisions of this part.

DEPARTMENT OF AGRICULTURE

Office of the Secretary

Meat import Limitations; First Quarterly Estimate

Public Law 88–482, enacted August 22, 1964, as amended by Public Law 96–177, Public Law 100–418, and Public Law 100–449 (hereinafter referred to as the "Act"), provides for limiting the quantity of fresh, chilled, or frozen meat of bovine, sheep except lamb, and goats; and processed meat of beef or veal (Harmonized Tariff Schedule of the United States subheadings 0201.10.00, 0201.20.20, 0201.20.40, 0201.20.60, 0201.30.20, 0201.30.40, 0201.30.60, 0202.10.00, 0202.20.20, 0202.20.40, 0202.20.60, 0202.30.20, 0202.30.40, 0202.30.60, 0204.21.00, 0204.22.40, 0204.23.40, 0204.41.00, 0204.42.40, 0204.43.40, and 0204.50.00), which may be imported, other than products of Canada, into the United States in any calendar year. Such limitations are to be imposed when the Secretary of Agriculture estimates that imports of articles, other than products of Canada, provided for in Harmonized Tariff Schedule of the United States subheadings 0201.10.00, 0201.20.40, 0201.20.60, 0201.30.40, 0201.30.60, 0202.10.00, 0202.20.40, 0202.20.60, 0202.30.40, 0202.30.60, 0204.21.00, 0204.22.40, 0204.23.40, 0204.41.00, 0204.42.40, 0204.43.40, and 0204.50.00), (hereinafter referred to as "meat articles"), in the absence of limitations under the Act during such calendar year, would equal or exceed 110 percent of the estimated aggregate quantity of meat articles prescribed for calendar year 1993 by section 2(c) as adjusted under section 2(d) of the Act.

In accordance with the requirements of the Act, I have made the following estimates:

1. The estimated aggregate quantity of meat articles prescribed by section 2(c) as adjusted by section 2(d) of the Act for calendar year 1993 is 1,144.7 million pounds.

2. The first quarterly estimate of the aggregate quantity of meat articles which would, in the absence of limitations under the Act, be imported during calendar year 1993 is 1,259.1 million pounds.

Done at Washington, DC this 31st day of December, 1992.

Edward Madigan,

Secretary of Agriculture.

COMMISSION ON CIVIL RIGHTS

Maine State Advisory Committee; Public Meetings

Notice is hereby given, pursuant to the provisions of the Rules and Regulations of the U.S. Commission on Civil Rights, that a meeting of the Maine State Advisory Committee will be convened at 2 p.m. and adjourn at 5 p.m. on Thursday, January 21, 1993, in suite 212, Civic Center Comfort Inn, 282 Civic Center Drive, Augusta, ME 04330. The purpose of the meeting is (1) to update Committee members and the public on the Commission; (2) to provide an orientation for new Committee members; and (3) to plan future activities.

Persons desiring additional information, or planning a presentation to the Committee, should contact Grayce E. Studley (207–563–3610) or John I. Binkley, Director, ERO (202–376–7533), or TDD (202–376–8116). Hearing impaired persons who will attend the meeting and require the services of a sign language interpreter should contact the regional office at least (5) working days before the scheduled date of the meeting.

The meeting will be conducted pursuant to the provisions of the rules and regulations of the Commission.

Dated at Washington, DC, December 22, 1992.

Carol-Lee Hurley,

Chief, Regional Programs Coordination Unit.

DEPARTMENT OF COMMERCE

Foreign-Trade Zones Board

[Order No. 619]

Expansion of Foreign-Trade Zone 162; New Haven, Connecticut

Pursuant to its authority under the Foreign-Trade Zones (FTZ) Act of June 18, 1934, as amended (19 U.S.C. 81a–81u) (the Act), and the FTZ Board Regulations (15 CFR part 400), the FTZ Board (the Board) adopts the following Resolution and Order:

Whereas, an application from the Greater New Haven Chamber of Commerce, grantee of Foreign-Trade Zone No. 162, for authority to relocate its general-purpose zone to a larger site at the Port of New Haven, New Haven, Connecticut, within the New Haven Customs port of entry, was filed by the Board on October 31, 1991, and notice inviting public comment was given in the **Federal Register** on November 15, 1991 (Docket 70–91, 56 FR 58030);

Whereas, an examiners committee has investigated the application in accordance with the Board's regulations and recommends approval;

Whereas, the expansion is necessary to improve and expand zone services in the New Haven area; and,

Whereas, the Board has found that the requirements of the Act and the Board's regulations are satisfied, and that approval is in the public interest;

Now, therefore, the Board hereby orders;

That the grantee is authorized to relocate and expand its zone in accordance with the application filed on October 31, 1991, subject to the Act and the Board's regulations (as revised, 56 FR 50790–50808, 10–8–91), including section 400.28.

Signed at Washington, DC, this 29th day of December, 1992.

Alan M. Dunn,

Assistant Secretary of Commerce for Import Administration, Chairman, Committee of Alternatives, Foreign-Trade Zones Board.

John J. Da Ponte, Jr.,

Executive Secretary.

[Order No. 623]

Expansion of Foreign-Trade Zone 101; Clinton County, Ohio

Pursuant to its authority under the Foreign-Trade Zones (FTZ) Act of June 18, 1934, as amended (19 U.S.C. 81a–81u) (the Act), and the FTZ Board Regulations (15 CFR part 400), the FTZ Board (the Board) adopts the following Resolution and Order:

Whereas, an application from the Airborne FTZ, Inc., grantee of Foreign-Trade Zone No. 101, for authority to expand its general-purpose zone at the Airborne Commerce Park in Clinton County, Ohio, adjacent to the Dayton Customs port of entry, was filed by the Board on April 27, 1992, and notice inviting public comment was given in the **Federal Register** on May 7, 1992 (Docket 13–92, 57 FR 19597);

Whereas, an examiners committee has investigated the application in accordance with the Board's regulations and recommends approval;

Whereas, the expansion is necessary to improve and expand zone services in the Clinton County area; and,

Whereas, the Board has found that the requirements of the Act and the Board's regulations are satisfied, and that approval is in the public interest;

Now, therefore, the Board hereby orders:

That the grantee is authorized to expand its zone in accordance with the application filed on April 27, 1992, subject to the Act and the Board's regulations (as revised, 56 FR 50790–50808, 10–8–91), including § 400.28.

Signed at Washington, DC, this 29th day of December, 1992.

Alan M. Dunn,

Assistant Secretary of Commerce for Import Administration, Chairman, Committee of Alternates, Foreign-Trade Zones Board.

John J. Da Ponte, Jr.,

Executive Secretary.

BILLING CODE 3510–DS–M

[Order No. 621]

Resolution and Order Approving the Application of the Port of Portland (Oregon) for Special-Purpose Subzone Status for Export Activity Tofle U.S.A., Inc. (Stainless Steel Tubing) Tualatin, OR

Proceedings of the Foreign-Trade Zones Board, Washington, D.C.

Resolution and Order

Pursuant to the authority under the Foreign-Trade Zones Act of June 18, 1934, as amended (19 U.S.C. 81a–81u), the Foreign-Trade Zones Board (the Board) adopts the following Resolution and Order:

The Board, having considered the matter, hereby orders:

After consideration of the application of the Port of Portland, grantee of Foreign-Trade Zone 45, filed with the Foreign-Trade Zones (FTZ) Board (the Board) on November 6, 1991, requesting special-purpose subzone status for export activity at the stainless steel tubing plant of Tofle U.S.A., Inc., in Tualatin, Oregon, adjacent to the Portland Customs port of entry, the Board, finding that the requirements of the Foreign-Trade Zones Act and the Board's regulations are satisfied, and that the proposal is in the public interest, approves the application.

The approval is subject to the FTZ Act and the FTZ Board's regulations (as revised, 56 FR 50790–50808, 10–8–91), including Section 400.28. The Secretary of Commerce, as Chairman and Executive Officer of the Board, is hereby authorized to issue a grant of authority and appropriate Board Order.

Whereas, by an Act of Congress approved June 18, 1934, an Act, "To provide for the establishment * * * of foreign-trade zones in ports of entry of the United States, to expedite and encourage foreign commerce, and for other purposes," as amended (19 U.S.C. 81a–81u) (the Act), the Foreign-Trade Zones Board (the Board) is authorized to grant to corporations the privilege of establishing foreign-trade zones in or adjacent to U.S. Customs ports of entry;

Whereas, the Board's regulations (15 CFR part 400) provide for the establishment of special-purpose subzones when existing zone facilities cannot serve the specific use involved;

Whereas, an application from the Port of Portland (Oregon), grantee of Foreign-Trade Zone 45, for authority to establish a special-purpose subzone for export activity at the stainless steel tubing plant of Tofle U.S.A., Inc., located in Tualatin, Oregon, was filed by the Board on November 6, 1991, and notice was given in the **Federal Register** on November 27, 1992 inviting public comment (FTZ Docket 75–91, 56 FR 60087); and,

Whereas, the Board has found that the requirements of the Act and the Board's regulations are satisfied and that the proposal is in the public interest;

Now, Therefore, the Board hereby authorizes the establishment of a subzone (Subzone 45E) for export activity at the stainless steel tubing plant of Tofle U.S.A., Inc., in Tualatin, Oregon, at the location described in the application, subject to the FTZ Act and the Board's regulations (as revised, 56 FR 50790–50808, 10–8–91), including Section 400.28.

Signed at Washington, DC, this 29th day of December, 1992, pursuant to Order of the Board.

Alan M. Dunn,

Assistant Secretary of Commerce for Import Administration, Chairman, Committee of Alternates Foreign-Trade Zones Board.

John J. Da Ponte, Jr.,

Executive Secretary.

BILLING CODE 3510–22–M

COMMITTEE FOR THE IMPLEMENTATION OF TEXTILE AGREEMENTS

Announcing 1993 Agreement Limits for Certain Cotton, Wool, Man-Made Fiber, Silk Blend and Other Vegetable Fiber Textiles and Textile Products Produced or Manufactured in Hong Kong

December 30, 1992.

AGENCY: Committee for the Implementation of Textile Agreements (CITA).

ACTION: Notice.

FOR FURTHER INFORMATION CONTACT: Anne Novak, International Trade

Specialist, Office of Textiles and Apparel, U.S. Department of Commerce, (202) 482–4212.

SUPPLEMENTARY INFORMATION:

Authority: Executive Order 11651 of March 3, 1972, as amended; section 204 of the Agricultural Act of 1956, as amended (7 U.S.C. 1854).

The Bilateral Textile Agreement of August 4, 1986, as amended and extended, and Memoranda of Understanding (MOUs) dated July 29, 1992, August 18, 1992 and November 23, 1992 between the Governments of the United States and Hong Kong establishes limits for the period January 1, 1993 through December 31, 1993. A complete list of the limits is published below.

A copy of the current bilateral agreement is available from the Textiles Division, Bureau of Economic and Business Affairs, U.S. Department of State, (202) 647–3889.

A description of the textile and apparel categories in terms of HTS numbers is available in the CORRELATION: Textile and Apparel Categories with the Harmonized Tariff Schedule of the United States (see **Federal Register** notice 57 FR 54976, published on November 23, 1992).

Category	Twelve-month limit
Group I	
200–229, 300–326, 360–369, 400–414, 464–469, 600–629 and 665–670, as a group.	212,057,104 square meters equivalent.
Sublevels in Group I	
200	288,725 kilograms.
219	33,488,449 square meters.
218/225/317/326	62,654,035 square meters of which not more than 3,450,739 square meters shall be in Category 218(1)—yarn dyed fabric other than denim and jacquard [1].
226/313	60,071,085 square meters.
314	16,200,451 square meters.
315	8,009,558 square meters.
369(1) [2] (shoptowels)	658,223 kilograms.
604	198,190 kilograms.
611	5,279,905 square meters.
617	3,331,250 square meters.
Group II	
237, 239, 330–359, 431–459, 630–659 and 843/844(1), as a group.	771,903,427 square meters equivalent.
Sublevels in Group II	
237	968,395 dozen.
239	4,439,251 kilograms.
331	3,766,184 dozen pairs.
333/334	259,205 dozen.
335	312,833 dozen.
336	187,035 dozen.
338/339 [3] (shirts and blouses other than tank tops and tops, knit).	2,658,990 dozen.
338/339(1) [4] (tank tops and knit tops).	1,997,712 dozen.
340	2,546,264 dozen.
341	2,577,404 dozen.
342	481,971 dozen.
345	394,291 dozen.
347/348	6,086,317 dozen of which not more than 2,995,454 dozen shall be in Category 347; not more than 4,612,442 dozen shall be in Category 348; not more than 6,086,317 dozen shall be in Categories 347–W/348–W [5] of which not more than 4,612,442 dozen shall be in Category 348–W.
350	119,067 dozen.
351	1,088,580 dozen.
352	5,695,971 dozen.
359(1) [6] (coveralls, overalls and jumpsuits).	514,982 kilograms.
359(2) [7] (outer vests)	1,073,329 kilograms.
433	9,090 dozen.
434	9,758 dozen.
435	70,000 dozen.
436	91,170 dozen.
438	748,772 dozen.
442	80,628 dozen.
443	57,523 numbers.
443/444/643/644/843/844(1) (made-to-measure suits).	51,462 numbers.
444	36,508 numbers.
445/446	1,237,621 dozen.
447/448	62,240 dozen.
631	537,473 dozen pairs.
633/634/635	1,162,665 dozen of which not more than 434,862 dozen shall be in Categories 633/634 and not more than 892,796 dozen shall be in Category 635.
636	251,718 dozen.
638/639	4,463,894 dozen.
640	801,977 dozen.
641	771,342 dozen.
642	200,176 dozen.
644	36,455 numbers.
645/646	1,283,443 dozen.
647	447,106 dozen.
648	976,355 dozen of which not more than 976,355 dozen shall be in Category 648–W [8].
649	688,364 dozen.
650	142,351 dozen.
651	272,605 dozen.
652	4,144,252 dozen.
659(1) [9] (coveralls, overalls and jumpsuits).	569,190 kilograms.
659(2) [10] (swimsuits)	227,316 kilograms.
Group III	
831–842, 843/844 (excluding made-to-measure suits), and 847–859, as a group.	43,071,306 square meters equivalent.
Sublevels in Group III	
835	101,129 dozen.
836	138,342 dozen.
840	600,714 dozen.
842	224,421 dozen.
847	322,604 dozen.
Limits not in a group	
845(1) [11] (sweaters made in Hong Kong).	1,100,777 dozen.
845(2) [12] (sweaters assembled in Hong Kong from knit-to-shape component parts knitted elsewhere).	2,634,842 dozen.
846(1) [13] (sweaters made in Hong Kong).	178,006 dozen.
846(2) [14] (sweaters assembled in Hong Kong from knit-to-shape component parts knitted elsewhere).	428,927 dozen.

[1] Category 218(1): The Government of Hong Kong will continue to visa these products as 218.

[2] Category 369(1): only HTS number 6307.10.2005.

[3] Categories 338/339: all HTS numbers except 6109.10.0018, 6109.10.0023, 6109.10.0060, 6109.10.0065, 6114.20.0005 and 6114.20.0010.

[4] Categories 338/339(1): only HTS numbers 6109.10.0018, 6109.10.0023, 6109.10.0060, 6109.10.0065, 6114.20.0005 and 6114.20.0010.

BILLING CODE 3510–DR–F

DEPARTMENT OF DEFENSE

GENERAL SERVICES ADMINISTRATION

NATIONAL AERONAUTICS AND SPACE ADMINISTRATION

[OMB Control No. 9000–0101]

Clearance Request Regarding Drug-Free Workplace

AGENCIES: Department of Defense (DOD), General Services Administration (GSA), and National Aeronautics and Space Administration (NASA).

ACTION: Notice of request for an extension to an existing OMB clearance (9000–0101).

SUMMARY: Under the provisions of the Paperwork Reduction Act of 1980 (44 U.S.C. 35), the Federal Acquisition Regulation (FAR) Secretariat has submitted to the Office of Management and Budget (OMB) a request to review and approve an extension of a currently approved information collection requirement concerning Drug-Free Workplace.

FOR FURTHER INFORMATION CONTACT: Edward Loeb, Office of Federal Acquisition Policy, GSA (202) 501–4547.

SUPPLEMENTARY INFORMATION:

A. Purpose

Public Law 100–690, the Drug-Free Workplace Act of 1988, mandates that: (1) Government contract employees notify their employer of any criminal drug statute conviction for a violation occurring in the workplace; and (2) Government contractors, after receiving notice of such conviction, must notify the Government contracting officer. These requirements are effective as of March 18, 1989.

The information provided to the Government will be used to determine contractor compliance with the statutory requirements to maintain a drug-free workplace.

B. Annual Reporting Burden

The annual reporting burden is estimated as follows: Respondents, 600; responses per respondent, 1; total annual responses, 600; preparation hours per response, .17; and total response burden hours, 102.

C. Annual Recordkeeping Burden

The annual recordkeeping burden is estimated as follows: Recordkeepers, 600; hours per recordkeeper, .5; and total recordkeeping burden hours, 300.

OBTAINING COPIES OF PROPOSALS: Requester may obtain copies of OMB applications or justifications from the General Services Administration, FAR Secretariat (VRS), room 4037, Washington, DC 20405, telephone (202) 501–4755. Please cite OMB Control No. 9000–0101, Drug-Free Workplace, in all correspondence.

Dated: December 28, 1992.

Beverly Fayson,

FAR Secretariat.

BILLING CODE 6820–34–M

DEPARTMENT OF DEFENSE

GENERAL SERVICES ADMINISTRATION

NATIONAL AERONAUTICS AND SPACE ADMINISTRATION

[OMB Control No. 9000–0108]

Clearance Request Regarding Bankruptcy

AGENCIES: Department of Defense (DOD), General Services Administration (GSA), and National Aeronautics and Space Administration (NASA).

ACTION: Notice of request for an extension to an existing OMB clearance (9000–0108).

SUMMARY: Under the provisions of the Paperwork Reduction Act of 1980 (44 U.S.C. 35), the Federal Acquisition Regulation (FAR) Secretariat has submitted to the Office of Management and Budget (OMB) a request to review and approve an extension of a currently approved information collection requirement concerning bankruptcy.

FOR FURTHER INFORMATION CONTACT: Edward Loeb, Office of Federal Acquisition Policy, GSA, (202) 501–4547.

SUPPLEMENTARY INFORMATION:

A. Purpose

Under statute, contractors may enter into bankruptcy which may have a significant impact on the contractor's ability to perform its Government contract. The Government often does not receive adequate and timely notice of this event. The subject contract clause requires contractors to notify the contracting officer within five days after the contractor enters into bankruptcy.

B. Annual Reporting Burden

The annual reporting burden is estimated as follows: Respondents, *1,000*; responses per respondent, *1*; total annual responses, *1,000*; preparation hours per response, *1*; and total response burden hours, *1,000*.

C. Annual Recordkeeping Burden

The annual recordkeeping burden is estimated as follows: Recordkeepers, *1,000*; hours per recordkeeper, *.25*; and total recordkeeping burden hours, *250*.

OBTAINING COPIES OF PROPOSALS: Requester may obtain copies of OMB applications or justifications from the General Services Administration, FAR Secretariat (VRS), room 4037, Washington, DC 20405, telephone (202) 501–4755. Please cite OMB Control No. 9000–0108, Bankruptcy, in all correspondence.

Dated: December 28, 1992.

Beverly Fayson,

FAR Secretariat.

BILLING CODE 6820–34–M

DEPARTMENT OF ENERGY

Energy Information Administration

Agency Information Collections Under Review by the Office of Management and Budget

AGENCY: Energy Information Administration, DOE.

ACTION: Notice of request submitted for review by the Office of Management and Budget.

SUMMARY: The Energy Information Administration (EIA) has submitted the energy information collection(s) listed at the end of this notice to the Office of Management and Budget (OMB) for review under provisions of the Paperwork Reduction Act (Public Law 96–511, 44 U.S.C. 3501 *et seq.*). The listing does not include collections of information contained in new or revised regulations which are to be submitted under section 3504(h) of the Paperwork Reduction Act, nor management and procurement assistance requirements collected by the Department of Energy (DOE).

Each entry contains the following information: (1) The sponsor of the collection (a DOE component, which term includes the Federal Energy Regulatory Commission); (2) Collection number(s); (3) Current OMB docket number (if applicable); (4) Collection title; (5) Type of request, e.g., new, revision, extension, or reinstatement; (6) Frequency of collection; (7) Response obligation, i.e., mandatory, voluntary, or required to obtain or retain benefit; (8) Affected public (9) An estimate of the number of respondents per report period; (10) An estimate of the number of responses per respondent annually; (11) An estimate of the average hours

per response; (12) The estimated total annual respondent burden; and (13) A brief abstract describing the proposed collection and the respondents.

DATES: Comments must be filed by February 5, 1993. If you anticipate that you will be submitting comments but find it difficult to do so within the time allowed by this notice, you should advise the OMB DOE Desk Officer listed below of your intention to do so, as soon as possible. The Desk Officer may be telephoned at (202) 395–3084. (Also, please notify the EIA contact listed below.)

ADDRESSES: Address comments to the Department of Energy Desk Officer, Office of Information and Regulatory Affairs, Office of Management and Budget, 726 Jackson Place NW., Washington, DC 20503. (Comments should also be addressed to the Office of Statistical Standards at the address below.)

FOR FURTHER INFORMATION AND COPIES OF RELEVANT MATERIALS CONTACT: Jay Casselberry, Office of Statistical Standards (EI–73), Forrestal Building, U.S. Department of Energy, Washington, DC 20585. Mr. Casselberry may be telephoned at (202) 254–5348.

SUPPLEMENTARY INFORMATION: The energy information collection submitted to OMB for review was:

1. Energy Information Administration
2. EIA–1, 3, 3A, 4, 5, 5A, 6, 7A, and 20
3. 1905–0167
4. Coal Program Package
5. Revision
6. Quarterly, Annually, Other (Standby)
7. Mandatory
8. Businesses or other for-profit
9. 6,133 respondents
10. 2.06 responses per respondent
11. 1.53 hours per response
12. 19,390 hours
13. The coal surveys collect data on coal production, consumption, stock prices, imports and exports. Data are published in various EIA publications. Respondents are manufacturing plants, producers of coke, purchasers and distributors of coal, coal mining operators, and coal-consuming electric utilities.

Authority: Sec. 5(a), 5(b), 13(b), and 52, Public Law 93–275, Federal Energy Administration Act of 1974, 15 U.S.C. 764(a), 764(b), 772(b), and 790a.

Issued in Washington DC, December 30, 1992.

Yvonne M. Bishop,

Director, Statistical Standards, Energy Information Administration.

[FR Doc. 93–205 Filed 1–5–93; 8:45 am]

SUPPLEMENTARY INFORMATION: The energy information collection submitted to OMB for review was:

1. Energy Information Administration
2. EIA–800–804, 807, 810–814, 816–818, 819M, 819A, 820, 822A/D, and 825
3. 1905–0165
4. Petroleum Supply Reporting System Surveys
5. Revision
6. On occasion, Weekly, Monthly, Annually, and Triennially
7. Mandatory
8. Businesses or other for-profit
9. 5,350 respondents
10. 10.305 responses per respondent
11. 1.145 hours per response
12. 63,134 hours
13. The Petroleum Supply Reporting System collects information needed for determining the supply and disposition of crude petroleum, petroleum products, and natural gas liquids. These data are published by the EIA. Respondents are producers of oxygenates, operators of petroleum refining facilities, blending plants, bulk terminals, crude oil and product pipelines, natural gas plant facilities, tanker and barge operators, and oil importers.

Authority: Sec. 5(a), 5(b), 13(b), and 52, Public Law 93–275, Federal Energy Administration Act of 1974, 15 U.S.C. 764(a), 764(b), 772(b), and 790a.

Issued in Washington, DC, Dec. 30, 1992.

BILLING CODE 6450–01–M

Federal Energy Regulatory Commission

[Docket Nos. EC93–6–000, et al.]

Cincinnati Gas & Electric Co. and PSI Energy, Inc., et al.; Electric Rate, Small Power Production, and Interlocking Directorate Filings

Take notice that the following filings have been made with the Commission:

1. Cincinnati Gas & Electric Co. and PSI Energy, Inc.

[Docket No. EC93–6–000]

December 28, 1992.

Take notice that on December 23, 1992, Cincinnati Gas & Electric Co. ("CG&E"), on behalf of itself (and its subsidiaries, Union Light, Heat and Power Co. and Miami Power Corp.) and PSI Energy, Inc. (together, "Applicants") filed, pursuant to section 203 of the Federal Power Act and Part 33 of the Commission's regulations, a Joint Application requesting authorization to merge and reorganize Applicants' utility operations and to dispose of Applicants' jurisdictional facilities.

Pursuant to an Agreement and Plan to Reorganization, PSI Resources Inc., PSI Energy and CG&E will merge into a new corporation, CINergy, and PSI Energy and CG&E will operate as separate utility divisions of CINergy. The subsidiaries of CG&E and PSI Resources (excluding PSI Energy, but including PSI Energy's subsidiaries) will become subsidiaries of CINergy. The merger will be effected through an exchange of stock, with PSI Resources and CG&E shareholders exchanging their shares for shares in CINergy.

Applicants have submitted the direct testimony of eleven witnesses who provide, *inter alia,* a description of the merger and the projected benefits for ratepayers and shareholders and an analysis of the effects of the merger on competition in the relevant markets. Applicants also have submitted a *pro forma* open access transmission tariff for Applicants' integrated system, which provides a range of services for a single rate.

Applicants have requested that the Commission expedite consideration of the Joint Application and approve it without an evidentiary hearing.

Comment date: January 27, 1993, in accordance with Standard Paragraph E at the end of this notice.

2. Northern States Power Co.

[Docket No. ER92–551–001]

December 30, 1992.

Take notice that on November 23, 1992, Northern States Power Company tendered for filing its compliance filing in response to a Commission letter order dated October 23, 1992.

Comment date: January 8, 1993, in accordance with Standard Paragraph E at the end of this notice.

3. Ogden Martin Systems of San Bernardino, Inc.

[Docket No. ER93–281–000]

December 30, 1992.

Take notice that on December 15, 1992, Odgen Martin Systems of San Bernardino, Inc. (Ogden-San Bernardino) tendered for filing a Notice of Termination of Rate Schedule FERC No. 1 of Ogden Martin Systems of San Bernardino, Inc. with the Federal Energy Regulatory Commission (FERC or the Commission).

On September 23, 1987, the Commission accepted for filing an electric power purchase agreement between Ogden-San Bernardino and Southern California Edison Company for the sale of capacity and energy from a proposed 42.5 MW solid waste, biomass-fueled small power production facility (the Facility) and designated the agreement as Rate Schedule FERC No. 1. Due to the decision of San Bernardino County, California, to not proceed with the construction of the Facility, Ogden-San Bernardino will not sell capacity and energy to Southern California Edison Company pursuant to Rate Schedule FERC No. 1 and, accordingly, seeks to terminate Rate Schedule FERC No.1.

Comment date: January 13, 1993, in accordance with Standard Paragraph E at the end of this notice.

4. Entergy Power, Inc.

[Docket Nos. ER92–611–000; ER92–664–000; ER92–843–000 and ER93–45–000]

December 30, 1992.

Take notice that on December 17, 1992, Entergy Power, Inc. submitted an amendment to its rate schedule filings originally submitted in the above dockets on June 3, 1992, June 26, 1992, August 14, 1992, September 18, 1992, and October 27, 1992.

The amendment responds to a deficiency letter from the Director of the Division of Applications dated November 17, 1992 and issued in the above referenced proceedings.

Comment date: January 13, 1993, in accordance with Standard Paragraph E at the end of this notice.

5. Gulf States Utilities Co.

[Docket No. ER93–292–000]

December 30, 1992.

Take notice that, pursuant to section 205 of the Federal Power Act and part 35 of the Commission's regulations, Gulf States Utilities Company (Gulf States), on December 22, 1992, tendered for filing rate schedule changes with respect to Gulf States' provision of wholesale and transmission service to Sam Rayburn Dam Electric Cooperative, Inc. (SRDE) and Sam Rayburn Municipal Power Agency (SRMA), and an initial Power Interconnection Agreement between Gulf States and the Vinton Public Power Authority (VPPA). Gulf States states that its filing amends the Power Interconnection Agreement and the Power Supply Agreement among Gulf States, SRDE, and SRMA to account for the sale of SRMA's interest in the jointly-owned Nelson 6 generating station to VPPA.

Gulf States requests a waiver of the prior notice requirements of the Federal Power Act and the Commission's regulations to allow an effective date for its filings of December 18, 1992.

Copies of the filing were served upon SRDE, SRMA, VPPA, the Public Utility Commission of Texas, and the Louisiana Public Service Commission.

Comment date: January 13, 1993, in accordance with Standard Paragraph E at the end of this notice.

6. Florida Power Corp.

[Docket No. ER93–299–000]

December 30, 1992.

Take notice that Florida Power Corporation (Florida Power), on December 24, 1992, tendered for filing a wholesale rate change in its full requirements, partial requirements and transmission rates. The amount of the rate change, either an increase or a decrease, depends on the rates to which the current ones are compared. If compared to the presently effective rates, the filed rates accomplish a rate decrease in the amount of $8.2 million or 5.6% on a 1993 calendar-year basis. If the rates filed herein are compared to the rates negotiated in settlement of Florida Power's last filing, (Consolidated Docket Nos. ER92–436–000 and EL92–29–000), an increase of $8.4 million per year or 6.8% on a 1993 calendar-year basis results.

Florida Power requests that the rate change be permitted to become effective on February 22, 1993, and that it be made effective without suspension if the compliance rates are in effect or be suspended for the minimum one-day period if the settlement rates are in effect. Florida Power states that it has served copies of its filing on the affected customers and the Florida Public Service Commission.

Comment date: January 13, 1993, in accordance with Standard Paragraph E at the end of this notice.

7. Public Service Company of New Mexico

[Docket No. ER93–300–000]

December 30, 1992.

Take notice that on December 28, 1992, Public Service Company of New Mexico (PNM) tendered for filing a Notice of Termination of the Interconnection Agreement (PNM Rate Schedule FPC No. 8 and supplements thereto) between PNM and The Western Colorado Power Company (WCP), as subsequently assigned to WCP's successor, Colorado-Ute Electric Association (CUEA) and since CUEA's bankruptcy to Public Service Company of Colorado (PSCo) and Tri-State Generation and Transmission Association, Inc. (Tri-State).

PNM requests that the Commission's notice requirements be waived to permit the Interconnection Agreement to be terminated effective upon the contract termination date of November 13, 1992.

Copies of the filing have been served upon PSCo, Tri-State and the New Mexico Public Service Commission.

Comment date: January 13, 1993, in accordance with Standard Paragraph E at the end of this notice.

8. Idaho Power Co.

[Docket No. ER93–89–000]

December 30, 1992.

Take notice that on December 22, 1992, Idaho Power Company (IPC) tendered for filing an amendment to its filing of its Agreement for the Sale and Purchase of Firm Energy dated August 31, 1992 with Oregon Trail Electric Consumers Cooperative, Inc.

IPC has requested waiver of the notice provisions § 35.3 of the Commission's regulations in order to permit the Agreement to become effective on January 1, 1993, as requested in the original filing of this Agreement.

Comment date: January 13, 1993, in accordance with Standard Paragraph E at the end of this notice.

9. G. Alex Bernhardt

[Docket No. ID–2541–001]

December 30, 1992.

Take notice that on December 24, 1992, G. Alex Bernhardt (Applicant) tendered for filing a supplemental application under section 305(b) of the Federal Power Act to hold the following positions:

Director Duke Power Company
Director First Union Corporation

Comment date: January 13, 1993, in accordance with Standard Paragraph E at the end of this notice.

10. Entergy Power Development Corp.

[Docket No. EG93–9–000]

December 30, 1992.

Take notice that on December 23, 1992, Entergy Power Development Corporation (Entergy Development) filed an application under section 32 of the Public Utility Holding Company Act of 1935, as amended by section 711 of the Energy Policy Act of 1992, seeking a determination by the Commission that Entergy Development is an exempt wholesale generator. Entergy Development owns an interest in a 250 MW electric generating facility located in Richmond, Virginia.

Comment date: January 19, 1993, in accordance with Standard Paragraph E at the end of this notice.

11. Long Island Lighting Co.

[Docket No. ER93–298–000]

December 30, 1992.

Take notice that on December 24, 1992, Long Island Lighting Company (LILCO) tendered for filing an Agreement between LILCO and the Suffolk County Electrical Agency (SCEA) dated November 12, 1992, for the delivery of certain New York Power Authority power and energy to eligible customers within LILCO's service territory in Suffolk County, New York, together with a supplement thereto which consists of a Letter Agreement between LILCO and the New York Power Authority (NYPA) dated October 29, 1992. LILCO has requested a waiver

so that this filing can become effective on January 1, 1993.

Notice is further given that upon acceptance for filing or approval of the instant filing, LILCO–FERC Rate Schedule No. 42, including Supplement Nos. 1 and 2, and those portions of LILCO–FERC Rate Schedule No. 40 that govern delivery of NYPA economic development power to SCEA's economic development customers are hereby cancelled.

LILCO states that this filing has been served upon the New York State Public Service Commission, NYPA, and SCEA.

Comment date: January 13, 1993, in accordance with Standard Paragraph E at the end of this notice.

12. Richmond Power Enterprise, L.P.

[Docket No. EG93–7–000]

December 30, 1992.

Take notice that on December 23, 1992, Richmond Power Enterprise, L.P. (Richmond Power) filed an application under Section 32 of the Public Utility Holding Company Act of 1935, as amended by section 711 of the Energy Policy Act of 1992, seeking a determination by the Commission that Richmond Power is an exempt wholesale generator. Richmond Power owns and operates a 250 MW electric generating facility located in Richmond, Virginia.

Comment date: January 19, 1993, in accordance with Standard Paragraph E at the end of this notice.

13. Entergy Richmond Power Corp.

[Docket No. EG93–8–000]

December 30, 1992.

Take notice that on December 23, 1992, Entergy Richmond Power Corporation (Entergy Richmond) filed an application under section 32 of the Public Utility Holding Company Act of 1935, as amended by section 711 of the Energy Policy Act of 1992, seeking a determination by the Commission that Entergy Richmond is an exempt wholesale generator. Entergy Richmond owns an interest in a 250 MW electric generating facility located in Richmond, Virginia.

Comment date: January 19, 1993, in accordance with Standard Paragraph E at the end of this notice.

14. Northeast Utilities Service Co.

[Docket No. ER93–297–000]

December 30, 1992.

Take notice that on December 23, 1992, Northeast Utilities Service Company (NUSCO) on behalf of The Connecticut Light and Power Company (CL&P), Western Massachusetts Electric Company (WMECO), and Public Service Company of New Hampshire (PSNH) tendered for filing a Capacity, Transmission and Energy Service Agreement between CL&P and Green Mountain Power Corporation (GMP), a Bulk Power Service Agreement between CL&P and Bozrah Light and Power Company and a Firm Transmission Service Agreement Between CL&P, WMECO, and PSNH and GMP.

NUSCO requests that the Commission waive its standard notice periods and filing regulations to the extent necessary to permit the rate schedule change to become effective as early as January 1, 1993, but no later than February 1, 1993.

NUSCO states that copies of this rate schedule have been mailed or delivered to each of the parties.

NUSCO further states that the filing is in accordance with section 35 of the Commission's regulations.

Comment date: January 13, 1993, in accordance with Standard Paragraph E at the end of this notice.

15. Green Mountain Power Corp.

[Docket No. ER93–296–000]

December 30, 1992.

Take notice that on December 23, 1992, Green Mountain Power Corporation (GMP) tendered for filing a Notice of Cancellation of Power Sales Agreement between GMP and Bozrah Light and Power Company (Bozrah) (GMP Rate Schedule FERC No. 104).

GMP states that the Notice of Cancellation is part of a comprehensive arrangement under which Bozrah will discontinue the purchase of its bulk power requirements from GMP and commence the purchase of its bulk power requirements from The Connecticut Light and Power Company. GMP has requested the Commission to waive any applicable requirements in order to make each of the agreements included in this arrangement effective on January 1, 1993.

Comment date: January 13, 1993, in accordance with Standard Paragraph E at the end of this notice.

Standard Paragraphs

E. Any person desiring to be heard or to protest said filing should file a motion to intervene or protest with the Federal Energy Regulatory Commission, 825 North Capitol Street, NE., Washington, DC 20426, in accordance with Rules 211 and 214 of the Commission's Rules of Practice and Procedure (18 CFR 385.211 and 385.214). All such motions or protests should be filed on or before the comment date. Protests will be considered by the Commission in determining the appropriate action to be taken, but will not serve to make protestants parties to the proceeding. Any person wishing to become a party must file a motion to intervene. Copies of this filing are on file with the Commission and are available for public inspection.

Lois D. Cashell,

Secretary.

BILLING CODE 6717–01–M

[Beaver City Canyon, Plant No. 2 Project, FERC No. 1858–002]

Beaver City Corp.; Availability of Environmental Assessment

December 30, 1992.

In accordance with the National Environmental Policy Act of 1969 and the Federal Energy Regulatory Commission's (Commission's) regulations, 18 CFR part 380 (Order No. 486, 52 FR 47897), the Office of Hydropower Licensing together with the USDA Forest Service (FS) have reviewed the application for new minor license for the existing Beaver City Canyon Plant No. 2 Hydroelectric Project, located on the Beaver River, in Beaver County, near Beaver, Utah, and have prepared a joint environmental assessment (EA) for the relicense proposal. In the EA, the FS and the Commission staff analyze the potential environmental impacts of the project and conclude that approval of the project, with appropriate environmental measures, would not constitute a major federal action significantly affecting the quality of the human environment.

Copies of the EA are available for review in the Public Reference Branch, room 3104, of the Commission's offices at 941 North Capitol Street, NW., Washington, DC 20426.

Lois D. Cashell,

Secretary.

Take notice that the following filings have been made with the Commission:

1. Texas Eastern Transmission Corporation

[Docket No. CP93–108–000]

December 28, 1992.

Take notice that on December 14, 1992, Texas Eastern Transmission Corporation (Texas Eastern), 5400 Westheimer Court, Houston, Texas 77056–5310 filed in Docket No. CP93–

108–000 an application pursuant to section 7(c) of the Natural Gas Act for a certificate of public convenience and necessity authorizing it to provide a new incremental firm transportation service pursuant to Rate Schedule FTS–11 and to construct and operate the associated incremental facilities required to perform the proposed transportation service, all as more fully set forth in the application which is on file with the Commission and open to public inspection.

Texas Eastern requests authorization to construct, install, own and operate the following facilities required to provide the proposed transportation service:

(a) 3.0 miles of 30-inch diameter pipeline in Warren County, Ohio;

(b) 1.4 miles of 36-inch diameter pipeline in Monroe County, Ohio;

(c) 0.96 mile of 36-inch diameter pipeline loop in Greene County, Pennsylvania;

(d) Replace approximately 1.07 miles of 24-inch diameter pipeline with 36-inch diameter pipeline at the Uniontown Compressor Station discharge in Somerset County, Pennsylvania;

(e) Replace approximately 1.00 mile of 24-inch diameter pipeline with 36-inch diameter pipeline at the Bedford Compressor Station discharge in Fulton County, Pennsylvania; and

(f) Replace approximately 1.21 miles of 20-inch diameter pipeline with 36-inch diameter pipeline at the discharge of Eagle Compressor Station in Bucks County, Pennsylvania.

Texas Eastern indicates that the proposed facilities would be used to render firm incremental transportation service for Staten Island Cogeneration Corporation (Staten Island) from the existing point of interconnection between Texas Eastern and ANR Pipeline Company (ANR) near Lebanon, Ohio to an existing point of interconnection between the facilities of Texas Eastern and the Brooklyn Union Gas Company (BUG) at Goethals Bridge, New York. Texas Eastern proposes to transport and make delivery of up to 11,600 Dth equivalent of natural gas per day to Staten Island.

Texas Eastern states that the estimated total capital cost of the proposed facilities is $14,598,000. Texas Eastern indicates that the proposed facilities will be financed initially by Texas Eastern with funds on hand, borrowing under Texas Eastern's revolving credit arrangements or short-term financing.

Comment date: January 19, 1993, in accordance with Standard Paragraph F at the end of this notice.

2. Arkla Energy Resources a division of Arkla, Inc.

[Docket No. CP93–128–000]

December 29, 1992.

Take notice that on December 22, 1992, Arkla Energy Resources, a division of Arkla, Inc., (AER), P.O. Box 21734, Shreveport, Louisiana 71151, filed in Docket No. CP93–128–000 a request pursuant to §§ 157.205, 157.211 and 157.212 of the Commission's Regulations under the Natural Gas Act (18 CFR 157.205, 157.211, 157.212) for authorization to construct and operate certain facilities under AER's blanket certificate issued in Docket No. CP82–384–000, *et al.*, pursuant to section 7 of the Natural Gas Act, all as more fully set forth in the request that is on file with the Commission and open to public inspection.

AER proposes to:

(1) Construct and operate two new sales taps and related facilities in Coal County, Oklahoma, for delivery of natural gas to Arkansas Louisiana Gas Company (ALG) for resale to two domestic customers, Stephen J. Burge, and Frank Whitt. It is projected that each customer would use approximately 1 Mcf on a peak day and 85 Mcf annually. AER states that each of the tap facilities would cost approximately $1,389.

(2) Operate an existing 1-inch tap on AER's Line OT–23 in Sebastian County, Arkansas, for delivery of natural gas for resale to ALG's domestic customer, Thomas Goodin, who is projected to use 1 Mcf on a peak day and 85 Mcf annually. AER states that this customer would manifold onto an existing tap installed for right-of-way grantor Terrell Jones in 1974.

AER states that the facilities would be financed with internally generated capital.

Comment date: February 12, 1993, in accordance with Standard Paragraph G at the end of this notice.

3. Northern Natural Gas Company

[Docket No. CP93–88–000]

December 29, 1992.

Take notice that on December 3, 1992, Northern Natural Gas Company (Northern), 1111 South 103rd Street, Omaha, Nebraska 68124–1000, filed in Docket No. CP93–88–000 an application pursuant to section 7(b) of the Natural Gas Act for permission and approval to abandon six individually certificated transportation and exchange agreements between Northern and EL Paso Natural Gas Company (EL Paso), all as more fully set forth in the application which is on file with the Commission and open to public inspection.

Specifically, Northern proposes to abandon its Rate Schedules T–1, T–3, T–25, X–21, X–58 and X–68 contained in its FERC Gas Tariff, Original Volume No. 2. Northern indicates that proper notice was given by Northern and El Paso for the termination of the service under these agreements are no longer required and the abandonment requested will not impact the remaining service of Northern of EL Paso. Finally, Northern states that EL Paso has received authorization from the Commission to abandon the certificates issued to EL Paso for two of these agreements and is filing in a separate application to abandon its certificates issued for the remaining four agreements.

Comment date: January 19, 1993, in accordance with Standard Paragraph F at the end of this notice.

4. Panhandle Eastern Pipe Line Co.

[Docket No. CP93–110–000]

December 30, 1992.

Take notice that on December 14, 1992, Panhandle Eastern Pipe Line Company (Panhandle), P.O. Box 1642, Houston, Texas 77251–1642, filed in Docket No. CP93–110–000 a request under Section 7(b) of the Commission's Regulations under the Natural Gas Act for a certificate permitting and approving abandonment of sales service provided to the City of Hazelton, Kansas (Hazelton), an existing jurisdictional customer under Panhandle's Rate Schedule SSS–3, all as more fully set forth in the request which is on file with the Commission and open to public inspection.

Panhandle states that it is requesting authorization to abandon firm sales service provided to Hazelton under Rate Schedule SSS–3, effective January 1, 1993, as a result of Hazelton's election to terminate its firm sales service with Panhandle effective January 1, 1993. Panhandle states that Hazelton will convert to firm transportation service provided under Panhandle's Rate Schedule SCT effective January 1, 1993. No facilities are proposed to be abandoned herein.

Comment date: January 21, 1993, in accordance with Standard Paragraph F at the end of this notice.

5. Panhandle Eastern Pipe Line Co.

[Docket No. CP93–115–000]

December 30, 1992.

Take notice that on December 17, 1992, panhandle Eastern Pipe Line Company (Panhandle), P.O. Box 1642, Houston, Texas 77251–1642, filed in Docket No. CP93–115–000 a request under section 7(b) of the Commission's

Regulations under the Natural Gas Act for a certificate permitting and approving abandonment of sales services provided to Associated Natural Gas Company (Associated), under Panhandle's Rate Schedules SSS–2 to be effective January 1, 1993, all as more fully set forth in the request which is on file with the Commission and open to public inspection.

Panhandle states it is requesting authorization to abandon firm sales service provided to Associated under Rate Schedule SSS–2, effective January 1, 1993, as a result of Associated's election to terminate its firm sales service with Panhandle effective January 1, 1993. Panhandles states that Associated will convert to firm transportation service provided under Panhandle's Rate Schedule SCT effective January 1, 1993. No facilities are proposed to be abandoned herein.

Comment date: January 21, 1993, in accordance with Standard Paragraph F at the end of this notice.

6. Panhandle Eastern Pipe Line Co.

[Docket No. CP93–112–000]

December 30, 1992.

Take notice that on December 15, 1992, Panhandle Eastern Pipe Line Company (Panhandle), P.O. Box 1642, Houston, Texas 77251–1642, filed in Docket No. CP93–112–000 a request under section 7(b) of the Commission's Regulations under the Natural Gas Act for a certificate permitting and approving abandonment of transportation and sales services provided to Kansas-Nebraska Natural Gas Company (KN), under Panhandle's Rate Schedules T–41, T–61, and TT–1 to be effective October 31, 1992, all as more fully set forth in the request which is on file with the Commission and open to public inspection.

Panhandle states that by letters dated October 19, 1992, Panhandle and KN have mutually agreed to terminate Rate Schedules TT–1, T–41 and T–61 effective October 31, 1992. Panhandle further states that the existing interconnections with KN will continue to be available for open access transportation service. No facilities are proposed to be abandoned herein.

Comment date: January 21, 1993, in accordance with Standard Paragraph F at the end of this notice.

7. United Gas Pipe Line Co.

[Docket No. CP93–131–000]

December 30, 1992.

Take notice that on December 2, 1992, United Gas Pipe Line Company (United), P.O. Box 1478, Houston, Texas 77251–1478, filed a request with the Commission in Docket No. CP93–131–000 pursuant to § 157.205 of the Commission's Regulations under the Natural Gas Act (NGA) for authorization of facilities previously constructed under section 311(a) of the Natural Gas Policy Act (NGPA) and § 284.3(c) of the Commission's regulations, under United's blanket certificate issued in Docket No. CP88–6–000, all as more fully set forth in the request which is open to public inspection.

United states that the proposed facilities will enable United to provide transportation services under its blanket transportation certificate through all of its facilities to all current and potential shippers. United also states that it has sufficient capacity to provide the proposed service without detriment to its other existing customers.

Comment date: February 16, 1993, in accordance with Standard Paragraph G at the end of this notice.

Standard Paragraphs

F. Any person desiring to be heard or make any protest with reference to said file with the Federal Energy Regulatory Commission, 825 North Capitol Street, N.E., Washington, DC 20426, a motion to intervene or a protest in accordance with the requirements of the Commission's Rules of Practice and Procedure (18 CFR 385.211 and 385.214) and the Regulations under the Natural Gas Act (18 CFR 157.10). All protests filed with the Commission will be considered by it in determining the appropriate action to be taken but will not serve to make the protestants parties to the proceeding. Any person wishing to become a party to a proceeding or to participate as a party in any hearing therein must file a motion to intervene in accordance with the Commission's Rules.

Take further notice that, pursuant to the authority contained in and subject to jurisdiction conferred upon the Federal Energy Regulatory Commission by sections 7 and 15 of the Natural Gas Act and the Commission's Rules of Practice and Procedure, a hearing will be held without further notice before the Commission or its designee on this filing if no motion to intervene is filed within the time required herein, if the Commission on its own review of the matter finds that a grant of the certificate is required by the public convenience and necessity. If a motion for leave to intervene is timely filed, or if the Commission on its own motion believes that a formal hearing is required, further notice of such hearing will be duly given.

Under the procedure herein provided for, unless otherwise advised, it will be unnecessary for the applicant to appear or be represented at the hearing.

G. Any person or the Commission's staff may, within 45 days after the issuance of the instant notice by the Commission, file pursuant to Rule 214 of the Commission's Procedural Rules (18 CFR 385.214) a motion to intervene or notice of intervention and pursuant to § 157.205 of the Regulations under the Natural Gas Act (18 CFR 157.205) a protest to the request. If no protest is filed within the time allowed therefore, the proposed activity shall be deemed to be authorized effective the day after the time allowed for filing a protest. If a protest is filed and not withdrawn within 30 days after the time allowed for filing a protest, the instant request shall be treated as an application for authorization pursuant to section 7 of the Natural Gas Act.

Lois D. Cashell,

Secretary.

[FR Doc. 93–229 Filed 1–5–93; 8:45 am]

BILLING CODE 6717–01–M

[Docket Nos. TA93–1–20–000 and TM93–8–20–000]

Algonquin Gas Transmission Co.; Notice of Proposed Changes in FERC Gas Tariff

December 30, 1992.

Take notice that Algonquin Gas Transmission Company ("Algonquin") on December 23, 1992, tendered for filing proposed changes in its FERC Gas Tariff, Third Revised Volume No. 1, as set forth in the revised tariff sheets:

Proposed to be effective February 1, 1993

6 Rev Sheet No. 63

Proposed to be effective March 1, 1993

2 Rev 16 Rev Sheet No. 21
2 Rev 16 Rev Sheet No. 22
2 Rev 16 Rev Sheet No. 25
2 Rev 16 Rev Sheet No. 26
2 Rev 16 Rev Sheet No. 27
2 Rev 16 Rev Sheet No. 28
2 Rev 16 Rev Sheet No. 29

Algonquin states that the revised tariff Sheet Nos. 21 through 29, listed above, are being filed as part of Algonquin's regularly scheduled Annual Purchased Gas Adjustment ("PGA") and Transportation Cost Adjustment ("TCA") to reflect the standby service costs to be charged by Texas Eastern Transmission Corporation ("Texas Eastern"), Transportation and Compression by Others' Costs ("T&C Costs") from Texas Eastern and Transcontinental Gas Pipe Line Corporation and purchased gas costs to be charged by its various suppliers.

Algonquin states that the effect of the change in rates in the listed sheets is to

decrease the demand charges by $0.4400 per MMBtu and to decrease the commodity charges by $0.4373 per MMBtu under all of Algonquin's firm sales rate schedules from those rates contained in Algonquin's last quarterly PGA and TCA filing, made October 29, 1992 in Docket Nos. TQ93–2–20–001 and TM93–5–20–000 and revised December 9, 1992 per Commission Letter Order of November 24, 1992.

Algonquin states that the proposed effective date for the listed tariff sheets is March 1, 1993 with the exception of 6 Rev Sheet No. 63.

Algonquin further states that it is filing Sheet No. 63 to concurrently track the change made by Texas Eastern in the underlying rates. Pursuant to section 4.2(c) of Rate Schedule ATAP, the proposed effective date of Sheet No. 63 is February 1, 1993 to coincide with the effective date of Texas Eastern's filing. The effect of the revision in rates in Rate Schedule ATAP is to decrease the demand rate by $0.7600 per MMBtu and decrease the maximum commodity rates by $0.0241 per MMBtu.

Any person desiring to be heard or to protest said filing should file a motion to intervene or protest with the Federal Energy Regulatory Commission, 825 North Capitol Street, NE., Washington, DC 20426, in accordance with sections 385.214 and 385.211 of the Commission's Rules and Regulations. All such motions or protests should be filed on or before January 15, 1993. Protests will be considered by the Commission in determining the appropriate action to be taken but will not serve to make protestants parties to the proceeding. Any person wishing to become a party must file a motion to intervene. Copies of this filing are on file with the Commission and are available for public inspection in the Public Reference Room.

Lois D. Cashell,

Secretary.

BILLING CODE 6717–01–M

[Docket No. RP93–53–000]

Carnegie Natural Gas Co.; Petition for Temporary Waiver of Regulations and Tariff, and for Expedited Action

December 30, 1992.

Take notice that on December 23, 1992, Carnegie Natural Gas Company (Carnegie) filed a petition for waiver of § 154.305(i) (1) (iii) of the Commission's regulations and Section 23.9 of the General Terms and Conditions of Carnegie's FERC Gas Tariff to permit Carnegie to retain the balance in the refund subaccount of its Account No. 191 until such time as the Account No. 191 settlement proposal filed in Carnegie's restructuring proceeding in Docket No. RS92–30–000 becomes subject to a final Commission order.

Carnegie requests that the Commission grant temporary waiver of the requirement that it disburse to its customers within 90 days, or before January 30, 1993, the demand portion of the refund received by Carnegie from Texas Eastern Transmission Corporation (Texas Eastern) on October 30, 1992. Carnegie states that waiver is requested only for the limited period pending the outcome of the issues in Docket No. RS92–30–000 concerning the treatment upon restructuring of Carnegie's remaining unrecovered gas costs.

Carnegie states that copies of the filing have been served upon all affected customers of Carnegie and interested state commissions.

Any person desiring to be heard or to protest said filing should file a motion to intervene or protest with the Federal Energy Regulatory Commission, 825 North Capitol Street, NE., Washington, DC 20426, in accordance with 18 CFR 385.214 and 385.211 of the Commission's Rules and Regulations. All such motions or protests should be filed on or before January 7, 1993. Protests will be considered by the Commission in determining the appropriate action to be taken, but will not serve to make protestants parties to the proceeding. Any person wishing to become a party must file a motion to intervene. Copies of this filing are on file with the Commission and are available for public inspection in the public reference room.

Lois D. Cashell,

Secretary.

BILLING CODE 6717–01–M

[Docket No. TM93–8–4–000]

Granite State Gas Transmission, Inc.; Notice of Proposed Changes in Rates

December 30, 1992.

Take notice that on December 28, 1992, Granite State Gas Transmission, Inc. (Granite State), 300 Friberg Parkway, Westborough, Massachusetts 01581 filed Sixth Revised Sheet No. 24 in its FERC Gas Tariff, Second Revised Volume No. 1, proposing changes in rates for effectiveness on January 28, 1993.

According to Granite State, its filing is submitted to passthrough to its customers the take-or-pay buydown and buyout costs directly billed to Granite State by Tennessee Gas Pipeline Company (Tennessee).

Granite State states that, on December 1, 1992, Tennessee filed revised tariff sheets to recover additional transition costs in Docket Nos. RP93–37–000 and TM93–2–9–000. According to Granite State, its tariff sheet reflects the changes in Tennessee's allocation of take-or-pay costs to Granite State and also complies with the requirements of the reallocation of costs to small customers pursuant to Order No. 528–A.

According to Granite State the proposed rate changes are applicable to its jurisdictional sales services rendered to Bay State Gas Company and Northern Utilities, Inc. and to a sale to a direct customer, Pease Air Force Base. Granite State further states that copies of its filing were served upon its customers and the regulatory commissions of the States of Maine, New Hampshire and Massachusetts.

Any person desiring to be heard or to make any protest with reference to said filing should file a motion to intervene or protest with the Federal Energy Regulatory Commission, 825 North Capitol Street, NE., Washington, DC 20426 in accordance with Rules 211 and 214 of the Commission's Rules of Practice and Procedure (18 CFR 385.211 and 385.214). All such motions or protests should be filed on or before January 7, 1993. Protests will be considered by the Commission in determining the appropriate action to be taken, but will not serve to make protestants parties to the proceeding. Any person wishing to become a party to the proceeding or to participate as a party in any hearing therein must file a motion to intervene in accordance with the Commission's Rules. Copies of this filing are on file with the Commission and are available for public inspection.

Lois D. Cashell,

Secretary.

BILLING CODE 6717–01–M

[Docket No. TM93–7–4–000]

Granite State Gas Transmission, Inc.; Notice of Proposed Changes in Rates

December 30, 1992.

Take notice that on December 28, 1992, Granite State Gas Transmission, Inc. (Granite State) 300 Friberg Parkway, Westborough, Massachusetts 01581 tendered for filing the revised tariff sheets listed below in its FERC Gas Tariff, Second Revised Volume No. 1,

containing changes in rates for effectiveness on December 1, 1992:

Eighteenth Revised Sheet No. 25
Second Revised Sheet No. 66

According to Granite State, it provides storage services for Bay State Gas Company and Northern Utilities, Inc., under its Rate Schedule S–1 with storage capacity provided in a facility operated by Penn-York Energy Corporation (Penn-York) pursuant to Penn-York's Rate Schedule SS–1.

Granite State further states that Penn-York filed proposed changes in its rates for storage service under Rate Schedule SS–1 in Docket No. RP92–161–000 which were suspended until December 1, 1992. According to Granite State, Penn-York moved its suspended rate changes into effect on December 1, 1992.

Granite State states that its filing tracks in its Rate Schedule S–1 the revised rates made effective on December 1, 1992 by the motion filed by Penn-York in Docket No. RP92–161–000.

Granite State states that copies of its filing were served on its storage service customers, Bay State Gas Company and Northern Utilities, Inc. and also on the regulatory commissions of the states of Maine, Massachusetts and New Hampshire.

Any person desiring to be heard or to protest said filing should file a motion to intervene or protest with the Federal Energy Regulatory Commission, 825 North Capitol Street, NE., Washington, DC 20426, in accordance with sections 211 and 214 of the Commission's Rules of Practice and Procedure (18 CFR 385.211 and 385.214). All such motions or protests should be filed on or before January 7, 1993. Protests will be considered by the Commission in determining the appropriate action to be taken, but will not serve to make protestants parties to the proceeding. Any person wishing to become a party must file a motion to intervene. Copies of this filing are on file with the Commission and are available for public inspection.

Secretary.

[FR Doc. 93–222 Filed 1–5–93; 8:45 am]

BILLING CODE 6717–01–M

[Project No. 1855–006]

New England Power Co.; Notice Dismissing Complaint

December 29, 1992.

New England Power Company is the licensee for the Bellows Falls Project No. 1855, located on the Connecticut River in Cheshire and Sullivan Counties, New Hampshire, and in Windham and Windsor Counties, Vermont.[1] Horace A. and Betty B. Bezanson, and their daughter Marcia S. Calloway (collectively, the Bezansons), own property within the project boundary over which New England Power has flowage rights.[2] On December 28, 1989, the Bezansons filed a complaint [3] alleging that New England Power [4] intended to convey certain property rights with respect to land within the project boundary and adjacent to the Bezansons' to facilitate the construction of a wood chip storage and transfer facility adjacent to the Bezanson's property. The wood chip facility was to be developed by Woodland Fiber, Inc. on land owned by Cersosimo Lumber Company over which New England Power has flowage rights.

On October 7, 1992, the Director, Division of Project Compliance and Administration (Director), sent a status request letter to the parties. The letter noted that during its preliminary investigation of the complaint the Commission staff had received informal indications that Woodland Fiber, Inc. may no longer be planning to construct the contemplated wood chip storage and transfer facility, such that the complaint may be moot. The letter asked the parties to advise the Commission of the current status of the matter, including any recommendations the parties might have with respect to future proceedings on the complaint.

Both parties responded to the Director's letter.[5] Marcia Calloway, on behalf of the Bezansons, responded first, indicating that she is "not privy to the plans" of either Woodland Fiber, Inc. or Cersosimo Lumber Company, and is "therefore unable to tell you the exact status of their intention * * *." Her letter refers to a recent application by Cersosimo for an access right-of-way permit, from which "complainants can only assume that the Woodland Fiber project is still viable." Accordingly, "complainants request the Commission to consider this matter as open and continue the proceeding pending definite withdrawal of the Woodland Fiber, Inc. wood chip storage and transfer facility project."

New England Power contends, in its response to the Director, that the complaint has been rendered moot and should therefore be dismissed. New England Power's response includes a letter to New England Power [6] from Ramsey, McLaren, the firm that had been retained by Woodland Fiber, Inc. to secure the permits and approvals necessary for the construction of the wood chip facility. That letter describes the current status of the proposed wood chip facility as follows:

3. In May 1991 the property owner advised Woodland Fiber that no further land lease extensions would be granted and that the purchase option had to be exercised if Woodland Fiber wanted to continue with its permit and approval process. Woodland Fiber did not exercise the purchase option.

4. The state Land Use Permit application was terminated at that time and the local site plan and zoning approvals subsequently expired due to an absence of activity within the statutory time period.

5. To the best of our knowledge, Woodland Fiber has no intention of resuming any activities necessary for the establishment of a wood fiber storage and transfer facility at this site and we have therefore closed the file. [Emphasis in original.]

New England sent a copy of its response to Marcia Calloway. No response to New England Power's letter was filed.

Based on the above-described correspondence in the record, there appears to be no present plans to construct and operate the proposed wood chip storage and transfer facility. Inasmuch as the complaint was predicated on the development of that facility, the complaint does not present a current controversy. Therefore, the complaint is dismissed, but without prejudice to refiling in the event that the proposal to construct the wood chip facility is revived.

This notice constitutes final agency action. Requests for rehearing by the Commission may be filed within 30

---

[1] 8 FERC ¶61,122 (1979).

[2] The Bellows Falls Project includes a 2,804-acre reservoir that extends approximately 26 miles upstream from the project's dam. The project boundary includes land along the shoreline that New England Power needs for the operation and maintenance of the project. New England Power has title in fee to only a small portion of this land, and has flowage easements over the rest.

[3] Notice of the complaint was published in the Federal Register (55 *FR* 19979, May 14, 1990).

[4] The complaint was filed against New England Power Service Company, an affiliate of New England Power Company, which is the licensee. New England Power filed an answer on June 13, 1990.

[5] See letter from Marcia S. Calloway, dated October 14 and filed October 19, 1992, and letter from Mark E. Slade, attorney for New England Power, dated November 6 and filed November 9, 1992, both addressed to the Commission's Secretary.

[6] See letter from Hal J. Wilkins to Mark Slade, dated November 4, 1992.

days of the issuance of this notice, pursuant to 18 CFR 385.713.

Lois D. Cashell,

Secretary.

[FR Doc. 93–109 Filed 1–5–93; 8:45 am]

BILLING CODE 6717–01–M

[Docket No. RP93–52–000]

Northern Natural Gas Co.; Notice of Proposed Changes in FERC Gas Tariff

December 30, 1992.

Take notice that Northern Natural Gas Company (Northern) on December 23, 1992, tendered for filing to become part of Northern's FERC Gas Tariff, the following tariff sheets, proposed to become effective January 1, 1993:

Fourth Revised Volume No. 1

Third Revised Sheet No. 56
Third Revised Sheet No. 57
Third Revised Sheet No. 58
Substitute Third Revised Sheet No. 56
Substitute Third Revised Sheet No. 57
Substitute Third Revised Sheet No. 58

Original Volume No. 2

One Hundred Twenty-Third Revised Sheet No. 1C
Substitute 123 Revised Sheet No. 1C

Northern states that the filing of the revised tariff sheets reflects notice to Northern's customers of the potential shifting of costs from the IGIC to the PGA. The Northern Distributor Group has challenged the inclusion of certain Pre-July 1991 costs in the IGIC and alleged that those costs should be more appropriately recovered through the PGA. Pursuant to this filing, Northern's Reconciliation Adjustment would increase $.057 to $.118. Northern states that it would defer collection of the $.057 increase pending resolution of the Northern Distributor Group's protest of Northern's IGIC Reconciliation Report filed April 30, 1992. Northern requests, at a minimum, that the Commission find the filing constitutes sufficient legal notice to the customers that if the Pre-July 1991 IGIC costs are to be recovered in the PGA, then the Reconciliation Adjustment will be modified accordingly.

Any person desiring to be heard or to protest said filing should file a motion to intervene or protest with the Federal Energy Regulatory Commission, 825 North Capitol Street, NE., Washington, DC 20426, in accordance with Rules 214 and 211 of the Commission's Rules of Practice and Procedure (18 CFR 385.214 and 385.211). All such petitions or protests must be filed on or before January 7, 1993. Protests will be considered by the Commission in determining the appropriate action to be taken, but will not serve to make protestants parties to the proceeding. Any person wishing to become a party must file a petition to intervene. Copies of this filing are on file with the Commission and are available for public inspection.

Lois D. Cashell,

Secretary.

BILLING CODE 6717–01–M

[Docket No. RP93–51–000]

Northwest Pipeline Corp.; Petition for Limited Waiver of Tariff Provisions

December 30, 1992.

Take notice that on December 21, 1992, Northwest Pipeline Corporation (Northwest) petitions the Commission for a limited waiver of the Commission's first-come, first-served policy as reflected in Section 1 of Northwest's TF–1 Rate Schedule and in the Priority Date provisions of section 12 of First Revised Volume 1–A of Northwest's FERC approved tariff, in order to allow the permanent assignment of firm transportation capacity presently held by Kern River Gas Supply Corporation (KRGS) to KRGS' producer-suppliers who have entered into "buy/sell" agreements with KRGS.

Northwest seeks waiver of the Commission's first-come, first-served policy in order to implement replacement firm transportation agreements with Petro-Canada, Salmon, CHMI, and WRI, who will each succeed to a portion of KRGS' interests under the Transportation Agreement pursuant to proposed assignments.

Northwest states that by providing firm transportation service directly to Salmon, Petro-Canada, CHMI, and WRI instead of indirectly through KRGS, simply eliminates KRGS as an unnecessary conduit in these suppliers securing transportation services on the Northwest system.

Northwest requests that the Commission grant any necessary waivers of the Commission's first-come, first-served policy and Northwest's applicable tariff provisions to permit KRGS' permanent assignment of its firm capacity on Northwest to Salmon, Petro-Canada, CHMI, and WRI.

Any person desiring to be heard or to protest said filing should file a motion to intervene or protest with the Federal Energy Regulatory Commission, 825 North Capitol Street, NE., Washington, DC 20426, in accordance with 18 CFR 385.214 and 385.211 of the Commission's Rules and Regulations. All such motions or protests should be filed on or before January 7, 1993. Protests will be considered by the Commission in determining the appropriate action to be taken, but will not serve to make protestants parties to the proceeding. Any person wishing to become a party must file a motion to intervene. Copies of this filing are on file with the Commission and are available for public inspection in the public reference room.

Lois D. Cashell,

Secretary.

Northwest Pipeline Corp.; Notice of Compliance Filing

December 30, 1992.

Take notice that on December 8, 1992, Northwest Pipeline Corporation (Northwest) made a filing to comply with Ordering Paragraph (B) of Federal Energy Regulatory Commission order issued September 24, 1992, in the above docket. Northwest provided justification of Order No. 500/528 recovery of a certain amount associated with transportation discounts included in five of Northwest's take-or-pay buyout/buydown settlements.

Any person desiring to protest said filing should file a protest with the Federal Energy Regulatory Commission, 825 North Capitol Street, NE., Washington, DC 20426, in accordance with Rule 211 of the Commission's Rules of Practice and Procedure 18 CFR 385.211. All such protests should be filed on or before January 7, 1993. Protests will be considered by the Commission in determining the appropriate action to be taken, but will not serve to make protestants parties to the proceeding. Copies of this filing are on file with the Commission and are available for public inspection.

Lois D. Cashell,

Secretary.

Panhandle Eastern Pipe Line Co.; Informal Settlement Conference

December 30, 1992.

Take notice that an informal settlement conference will be convened in this proceeding on Wednesday, January 13, 1993, at 10 a.m. The conference will be held at the offices of the Federal Energy Regulatory Commission, 810 First Street, NE.,

Washington, DC, for the purpose of exploring the possible settlement of all issues raised in the above-referenced docket.

Any party, as defined in 18 CFR 385.102(c) or any participant, as defined in 18 CFR 385.102(b) is invited to attend. Persons wishing to become a party must move to intervene and receive intervenor status pursuant to the Commission's regulations, 18 CFR 385.214.

For additional information, contact Carmen Gastilo at (202) 208–2182 or Joanne Leveque at (202) 208-5705.

BILLING CODE 6717–01–M

[Docket No. RP93–23–001]

Transcontinental Gas Pipe Line Corp.; Notice of Proposed Change in FERC Gas Tariff

December 30, 1992.

Take notice that Transcontinental Gas Pipe Line Corporation (TGPL) on December 21, 1992, tendered for filing a certain tariff sheets to Third Revised Volume No. 1 of its FERC Gas Tariff (Tariff). The proposed effective date of the revised tariff sheets is December 13, 1992.

On November 12, 1992, TGPL filed Third Revised Sheet No. 62 to the Tariff to permit TGPL to discount its Commodity Producer Settlement Payment (PSP) charge for quantities of gas received and redelivered by TGPL in its Rate Zones 1, 2 or 3 under its Rate Schedules IT and FT. By order issued on December 11, 1992 in the referenced proceeding (Order), the Commission accepted and suspended effective December 13, 1992 Third Revised Sheet No. 62 subject to refund and subject to modifications and conditions.

Specifically, the Order required TGPL to file tariff sheets including language permitting TGPL to discount all of its take-or-pay commodity surcharges, including those for transportation in Zones 4, 5 and 6, in a non-discriminatory manner. The Order further required TGPL's filing to include the appropriate rate sheets reflecting maximum and minimum rates for all of TGPL's take-or-pay surcharges not already filed. TGPL states that the purpose of the instant filing is to comply with the Order.

Any person desiring to protest said filing should file a protest with the Federal Energy Regulatory Commission, 825 North Capitol Street, NE., Washington, DC 20426, in accordance with Rule 211 of the Commission's Rules of Practice and Procedure 18 CFR 385.211. All such protests should be filed on or before January 7, 1993. Protests will be considered by the Commission in determining the appropriate action to be taken, but will not serve to make protestants parties to the proceeding. Copies of this filing are on file with the Commission and are available for public inspection.

ENVIRONMENTAL PROTECTION AGENCY

[FRL–4552–7]

Agency Information Collection Activities Under OMB Review

AGENCY: Environmental Protection Agency (EPA).

ACTION: Notice.

SUMMARY: In compliance with the Paperwork Reduction Act (44 U.S.C. 3501 *et seq.*), this notice announces that the Information Collection Request (ICR) abstracted below has been forwarded to the Office of Management and Budget (OMB) for review and comment. The ICR describes the nature of the information collection and its expected cost and burden.

DATES: Comments must be submitted on or before February 5, 1993. For further information, or to obtain a copy of this ICR, contact Sandy Farmer at EPA (202) 206–2740.

SUPPLEMENTARY INFORMATION:

Office of Pesticides and Toxic Substances

Title: Section 12(b) Notification of Chemical Exports (EPA ICR No.: 0795.07; OMB No.: 2070–0030). This is a reinstatement of a previously approved collection.

Abstract: Under section 12(b)(2) of the Toxic Substances Control Act (TSCA), those who export or intend to export federally regulated chemical substances (or mixtures) must notify the EPA Administrator annually of the export or intent to export. EPA will then notify the government of the importing country of the Agency's action concerning the regulated chemical. Respondents submit to EPA one annual notice per chemical, or list of chemicals, for each country to which they are intending to export. A notice consists of: the name and the address of the exporter, the name (or list) of the chemical(s) to be exported, the country of import, the date of export, and the citation of the TSCA section (4, 5, 6, or 7) requiring the chemicals to be reviewed for export.

Burden Statement: The estimated public reporting burden for this collection of information is 38 hours per respondent annually. On average a respondent will prepare 74 export notices each requiring 0.5 hour. This estimate includes the time to read the instructions, gather existing information, prepare the chemical lists and submit the annual notice.

Respondents: Exporters of TSCA 12(b) chemicals.

Estimated No. of Respondents: 162.

Estimated No. of Responses per Respondent: 74.

Estimated Total Annual Burden on Respondents: 6,162 hours.

Frequency of Collection: Annually and on occasion.

Send comments regarding the burden estimate, or any other aspect of the information collection, including suggestions for reducing the burden to: Sandy Farmer, U.S. Environmental Protection Agency, Information Policy

Branch (PM 223Y), 401 M Street, SW, Washington, DC 20460.

and

Matthew Mitchell, Office of Management and Budget, Office of Information and Regulatory Affairs, 725 17th Street, NW., Washington, DC 20503.

Dated: December 30, 1992.

Paul Lapsley,

Director, Regulatory Management Division.

BILLING CODE 6560–50–M

FEDERAL COMMUNICATIONS COMMISSION

Public Information Collection Requirements Submitted to Office of Management and Budget for Review

December 28, 1992.

The Federal Communications Commission has submitted the following information collection requirements to OMB for review and clearance under the Paperwork Reduction Act of 1980 (44 U.S.C. 3507).

Copies of these submissions may be purchased from the Commission's copy contractor, Downtown Copy Center, 1990 M Street, NW., suite 640, Washington, DC 20036, (202) 452–1422. For further information on these submissions contact Judy Boley, Federal Communications Commission, (202) 632–7513. Persons wishing to comment on these information collections should contact Jonas Neihardt, Office of Management and Budget, room 3235 NEOB, Washington, DC 20503, (202) 395–4814.

OMB Number: 3060–0054.
Title: Application for Exemption From Ship Station Requirements
Form Number: FCC Form 820
Action: Revision of a currently approved collection
Respondents: Individuals or households and business or other for-profit (including small businesses)
Frequency of Response: On occasion reporting
Estimated Annual Burden: 200 responses; 1.166 hours average burden per response; 233 hours total annual burden
Needs and Uses: Applicants are required to complete FCC Form 820 to apply for exemption from radio provisions of statute, treaty, or international agreement. The forms is being revised to remove data elements that are no longer necessary and to re-word and reformat questions to simplify completion of the form.

OMB Number: 3060–0184.
Title: Section 73.1740, Minimum Operating Schedule
Action: Extension of a currently approved collection
Respondents: Businesses or other for-profit (including small businesses)
Frequency of Response: On occasion reporting
Estimated Annual Burden: 330 responses; 0.5 hours average burden per response; 165 hours total annual burden
Needs and Uses: Section 73.1740 requires licensees of commercial broadcast stations to notify the FCC in Washington, DC when events beyond their control make it impossible to continue operation or to adhere to the required operating schedules set forth in this section. In addition, the FCC must be notified when normal operation is resumed. No further authority is needed for limited operation or discontinued operation for a period not exceeding 30 days. Should events beyond the licensees control make it impossible for compliance within the required 30-day time period, an informal written request shall be submitted to the FCC requesting the amount of additional time that the licensee deems necessary. The data are used by FCC staff to authorized temporarily a limited operation or a discontinuance of operation.

Federal Communications Commission.

Donna R. Searcy,

Secretary.

BILLING CODE 6718–02–M

FEDERAL FINANCIAL INSTITUTIONS EXAMINATION COUNCIL

Appraisal Subcommittee; Interim Order Granting Commonwealth of the Northern Mariana Islands Emergency Temporary Waiver Relief and Request for Comments

[Docket No. AS92–5]

AGENCY: Appraisal Subcommittee, Federal Financial Institutions Examination Council.

ACTION: Interim order granting Commonwealth of the Northern Mariana Islands ("CNMI") emergency temporary waiver relief from State appraiser certification and licensure requirements and request for comments.

SUMMARY: The Appraisal Subcommittee ("ASC") of the Federal Financial Institutions Examination Council ("FFIEC"), with the FFIEC's approval, is issuing an interim Order granting CNMI emergency temporary waiver relief under section 1119(b)[1] of title XI of the Financial Institutions Reform, Recovery, and Enforcement Act of 1989 ("FIRREA"), as amended.[2] This interim relief will run from January 1, 1993, until the effective date of the ASC's final Order on this matter. The ASC also is soliciting comments from interested members of the public regarding CNMI's temporary waiver request.

DATES: Effective date of interim Order is January 1, 1993. Written comments on this Notice must be submitted on or before the close of business on February 5, 1993.

ADDRESSES: Copies of the request for temporary waiver relief and supporting documentation are available for public inspection at: Appraisal Subcommittee, 2100 Pennsylvania Avenue, NW., suite 200, Washington, DC 20037. Written comments may be mailed to the Appraisal Subcommittee at this location, and those comments also will be made available for public inspection.

FOR FURTHER INFORMATION CONTACT: Edwin W. Baker, Executive Director, or Marc L. Weinberg, General Counsel, at (202) 634–6520, Appraisal Subcommittee, 2100 Pennsylvania Avenue, NW., suite 200, Washington, DC 20037.

SUPPLEMENTARY INFORMATION:

I. Background

After December 31, 1992, all federally regulated financial institutions must use State licensed or certified appraisers, as appropriate, in federally related transactions.[3] Thus, each State should have in place at that time its entire regulatory scheme for certifying, licensing and supervising real estate appraisers.

Section 1119(b) of title XI provides the ASC and the States with a degree of flexibility in dealing with extraordinary circumstances that may occur at any time at December 31st. This Section enables the ASC to waive, on a temporary basis and with the FFIEC's approval,[4] any State certification or licensing requirement on a written finding that: (1) "There is a scarcity of certified or licensed appraisers to perform appraisals in connection with federally related transactions"; and (2) that the scarcity is "leading to significant delays in the performance of such appraisals." Either a State in compliance with title XI or the ASC can make a written "scarcity/delay" finding. A State, however, cannot grant or deny a waiver under section 1119(b); that authority belongs only to the ASC.

---

[1] 12 U.S.C. 3348(b).

[2] Public Law 101–73, 103 Stat. 183 (1989), as amended by Public Law 102–233, 105 Stat. 1761, 1792 (1991), Public Law 102–242, 105 Stat. 2330, 2386 (1991), Public Law 102–550, 106 Stat. 3672 (1992), and Public Law 102–485, 106 Stat. 2771 (1992).

[3] See Section 1119(a) of title XI, 12 U.S.C. 3348(a).

[4] On December 30, 1992, the Chairman of the FFIEC has approved this action pursuant to authority delegated by the Council.

Congress intended that the ASC exercise this waiver authority "cautiously."[5] Temporary waivers terminate when the ASC "determines that such * * * delays have been eliminated."

In April 1992, the ASC adopted rules governing the handling of temporary waiver requests.[6] In order for a waiver request to be received by the ASC for processing, ASC Rule 1102.2 requires a State appraiser regulatory agency to include in its request:

(a) * * * a written, duly authorized determination by the * * * Agency that there is a scarcity of State licensed or State certified appraisers leading to significant delays in obtaining appraisals in federally related transactions;

(b) The requirement or requirements of State law from which relief is being sought;

(c) A description of all significant problems currently being encountered in efforts to comply with title XI;

(d) The nature of the scarcity of certified or licensed appraisers (including supporting documentation);

(e) The extent of the delays anticipated or experienced in obtaining the services of certified or licensed appraisers (including supporting documentation);

(f) The reasons why the requester believes that the requirement or requirements are causing the scarcity of certified or licensed appraisers and the service delays; and

(g) A specific plan for expeditiously alleviating the scarcity and the service delays.

Rule 1102.4 requires the ASC to publish a notice promptly in the **Federal Register** respecting the received request which must "contain a concise general statement of the nature and basis for the action and (must) give interested persons 30 calendar days from its publication in which to submit written data, views and arguments." The ASC then, under Rule 1102.5, must "either grant or deny a waiver in whole, in part, and upon specified terms and conditions" within "45 calendar days of the date of publication of the notice * * * in the **Federal Register**." The ASC retains significant flexibility in the case of an emergency. If the ASC determines that an emergency exists, "the ASC may issue an interim approval Order simultaneously with its action" publishing the Rule 1102.4 notice in the **Federal Register**.

II. CNMI's Request

On December 21, 1992, the ASC received a letter dated December 16, 1992, from Lorenzo I. De Leon Guerrero, the Governor of CNMI. The letter requested a one-year waiver, i.e., from January 1 through December 31, 1993, from the requirement to use certified or licensed real estate appraisers within CNMI. CNMI stated that, while it has made "substantial, documented progress," it continues "to encounter significant problems in [its] efforts to comply with Title XI" and has "a serious shortage of [certified or licensed] appraisers."

More specifically, CNMI stated that only four appraisers in CNMI "theoretically qualify for appraisal work" and that, "[d]espite good faith efforts * * *, we still can't qualify the people we have available, In practice, we have only one person who might be able to meet Title XI requirements. This person must complete required courses." However, no appraisal education providers are situated on CNMI, and the closest educational provider is on the island of Guam, 120 miles south by air. CNMI concluded that "[e]ducation is our dilemma. It relates directly to our present scarcity of appraisers."

CNMI further represented that this scarcity of appraisers causes "inordinate delays in connection with federally related transactions. Six retail banks operate in CNMI.* * * Many people seek federally guaranteed home loans. Business loan applications are brisk. We have significant appraiser business and presently no local qualified appraisers to serve it." CNMI concedes that appraisers who are licensed or certified in Guam are willing to come to CNMI to perform appraisals. The use of such appraisers, however, "means delay" and "significant and burdensome costs to loan applicants."

CNMI noted that it has a specific plan for resolving the scarcity and delays. A one-year waiver will "allow our local appraisers time to finish the required appraisal courses. At least one of our local appraisers has started the course work, presently only available on Guam." CNMI also is "working on getting the qualified Guam instructors to come to the CNMI to teach appraisal courses." In sum, CNMI promised to "work hard to make the plan a success."

III. Finding of an Emergency Under Rule 1102.5

On the basis of the foregoing representations of CNMI's Governor, the ASC finds that an emergency exists in CNMI. Absent emergency interim relief, CNMI's appraisers who have not been licensed or certified would be unable to perform appraisals in connection with federally related transactions for federally regulated lenders during the period of January 1, 1993, until the time that the ASC makes a final determination respecting CNMI's temporary waiver request under Rule 1102.5. Those lenders would be forced to fly into CNMI State certified or licensed appraisers from elsewhere, *e.g.*, Guam, Hawaii or the United States mainland. In the worst case, such appraisers would not be available and real estate loans in federally related transactions could not be made in compliance with federal law. And, in the best case, significant delays and additional costs would likely result.

IV. Order

On the basis of the foregoing and with the concurrence of the FFIEC, the ASC finds that an emergency exists in CNMI under section 1119(b) of title XI and 12 CFR part 1102, subpart A, thereunder, and orders temporary interim waiver relief under those provisions for CNMI for the period beginning on January 1, 1993, through the date on which the ASC will make a final determination respecting CNMI's temporary waiver request, not to exceed February 22, 1993. Thus, during the time that this Order is effective within CNMI, the federally regulated lenders specified in section 1120 of Title XI[7] may use appraisers who are not licensed or certified so long as appraisals are performed in a manner that is consistent with the appraisal regulations, requirements, guidelines and standards of the appropriate federal financial institution regulatory agency.[8] By the Appraisal Subcommittee of the Federal Financial Institutions Examination Council.

Dated: December 30, 1992.

Fred D. Finke,

Chairman.

FEDERAL RESERVE SYSTEM

Barnett Merger Corp., et al.; Acquisitions of Companies Engaged in Permissible Nonbanking Activities

The organizations listed in this notice have applied under § 225.23(a)(2) or (f) of the Board's Regulation Y (12 CFR 225.23(a)(2) or (f)) for the Board's approval under section 4(c)(8) of the Bank Holding Company Act (12 U.S.C. 1843(c)(8)) and § 225.21(a) of Regulation Y (12 CFR 225.21(a)) to acquire or control voting securities or assets of a company engaged in a nonbanking activity that is listed in § 225.25 of Regulation Y as closely related to banking and permissible for bank holding companies. Unless otherwise noted, such activities will be conducted throughout the United States.

Each application is available for immediate inspection at the Federal Reserve Bank indicated. Once the application has been accepted for processing, it will also be available for inspection at the offices of the Board of Governors. Interested persons may express their views in writing on the question whether consummation of the proposal can "reasonably be expected to produce benefits to the public, such as greater convenience, increased competition, or gains in efficiency, that outweigh possible adverse effects, such as undue concentration of resources, decreased or unfair competition, conflicts of interests, or unsound banking practices." Any request for a hearing on this question must be accompanied by a statement of the reasons a written presentation would not suffice in lieu of a hearing, identifying specifically any questions of fact that are in dispute, summarizing the evidence that would be presented at a hearing, and indicating how the party commenting would be aggrieved by approval of the proposal.

Unless otherwise noted, comments regarding each of these applications must be received at the Reserve Bank indicated for the application or the offices of the Board of Governors not later than January 26, 1993.

A. Federal Reserve Bank of Atlanta (Zane R. Kelley, Vice President) 104 Marietta Street, N.W., Atlanta, Georgia 30303:

1. Barnett Merger Corp., Jacksonville, Florida; to acquire Barnett Banks Trust Company, N.A., Jacksonville, Florida, and thereby engage in trust company functions pursuant to § 225.25(b)(3) of the Board's Regulation Y.

2. Main Street Banks Incorporated, Covington, Georgia; to acquire First Federal Savings Bank of Georgia, and thereby engage in operating a savings association pursuant to § 225.25(b)(9) of the Board's Regulation Y.

B. Federal Reserve Bank of St. Louis (Randall C. Sumner, Vice President) 411 Locust Street, St. Louis, Missouri 63166:

1. Union Planters Corporation, Memphis, Tennessee; to acquire First Federal Savings Bank of Maryville, Maryville, Tennessee, and thereby engage in operating a savings association pursuant to § 225.25(b)(9); and in the sale of credit life, accident, and health insurance as principal, agent, or broker, directly related to the extensions of credit by First Federal and limited to assuring the repayment of the outstanding balance due on the extension of credit in the event of the death, disability, or involuntary unemployment of the debt pursuant to § 225.25(b)(8)(i) of the Board's Regulation Y.

Board of Governors of the Federal Reserve System, December 30, 1992.

BILLING CODE 6210–01–F

FEDERAL TRADE COMMISSION

[Dkt 9254]

Alliant Techsystems Inc.; Proposed Consent Agreement With Analysis To Aid Public Comment

AGENCY: Federal Trade Commission.

ACTION: Proposed consent agreement.

SUMMARY: In settlement of alleged violations of federal law prohibiting unfair acts and practices and unfair methods of competition, this consent agreement, accepted subject to final Commission approval, would require, among other things, a Minnesota-based defense systems contractor that provides ammunition, for a 10-year period, to obtain Commission approval before: acquiring the assets or stock of any company engaged in systems contracting for certain tank or lightweight ammunition; or selling or transferring Alliant's stock or assets to a company engaged in systems contracting for certain types of ammunition. In addition, the respondent would be required to terminate its proposed acquisition of Olin.

DATES: Comments must be received on or before March 8, 1993.

ADDRESSES: Comments should be directed to: FTC/Office of the Secretary, room 159, 6th St. and Pa. Ave., NW., Washington, DC 20580.

FOR FURTHER INFORMATION CONTACT: Laura Wilkinson, FTC/S–2308, Washington, DC 20580. (202) 326–2830.

SUPPLEMENTARY INFORMATION: Pursuant to section 6(f) of the Federal Trade Commission Act, 38 Stat. 721, 15 U.S.C.

46 and § 3.25(f) of the Commission's Rules of Practice (16 CFR 3.25(f)), notice is hereby given that the following consent agreement containing a consent order to cease and desist, having been filed with and accepted, subject to final approval, by the Commission, has been placed on the public record for a period of sixty (60) days. Public comment is invited. Such comments or views will be considered by the Commission and will be available for inspection and copying at its principal office in accordance with § 4.9(b)(6)(ii) of the Commission's Rules of Practice (16 CFR 4.9(b)(6)(ii)).

Agreement Containing Consent Order

In the matter of Alliant Techsystems Inc., a corporation.

The agreement herein, by and between Alliant Techsystems Inc. ("Alliant"), a corporation, by its duly authorized officer and its attorney, and counsel for the Federal Trade Commission ("the Commission"), is entered into in accordance with the Commission's Rule governing consent order procedures. In accordance therewith the parties hereby agree that:

1. Alliant is a corporation organized, existing and doing business under the laws of the State of Delaware, with its office and principal place of business located at 5901 Lincoln Drive, Edina, Minnesota 55436.

2. Alliant has been served with a copy of the complaint issued by the Federal Trade Commission charging it with violations of section 7 of the Clayton Act, as amended, and section 5 of the Federal Trade Commission Act, as amended. Alliant denies said charges.

3. Alliant admits all the jurisdictional facts set forth in the Commission's complaint in this proceeding.

4. Alliant waives:

a. Any further procedural steps;

b. The requirement that the Commission's decision contain a statement of findings of fact and conclusions of law;

c. All rights to seek judicial review or otherwise challenge or contest the validity of the Order entered pursuant to this agreement; and,

d. All rights under the Equal Access to Justice Act.

5. This agreement shall not become part of the public record unless and until it is accepted by the Commission. If this agreement is accepted by the Commission, it will be placed on the public record for a period of sixty (60) days and information in respect thereto publicly released. The Commission thereafter may either withdraw its acceptance of this agreement and so notify Alliant, in which event it will take such action as it may consider appropriate, or issue and serve its decision, in disposition of the proceeding.

6. This agreement is for settlement purposes only and does not constitute an admission by Alliant that the law has been violated as alleged in the complaint issued by the Commission.

7. This agreement contemplates that, if it is accepted by the Commission, and if such acceptance is not subsequently withdrawn by the Commission pursuant to the provisions of § 3.25(f) of the Commission's Rules, the Commission may, without further notice to Alliant, 1) issue its decision containing the following Order in disposition of the proceeding, and 2) make information public with respect thereto. When so entered, this Order shall have the same force and effect, and may be altered, modified or set aside in the same manner and within the same time provided by statute for other orders. This Order shall become final upon service. Delivery by the U.S. Postal Service of the decision containing the agreed to Order to Alliant's address as stated in this agreement shall constitute service. Alliant waives any right it may have to any other manner of service. The complaint may be used in construing the terms of this Order, and no agreement, understanding, representation or interpretation not contained in the Order or this agreement may be used to vary or contradict the terms of the Order.

8. Alliant has read the complaint and Order contemplated hereby. Alliant understands that it may be liable for civil penalties in the amount provided by law for each violation of the Order after it becomes final.

Order

I.

For purposes of this Order, the following definitions shall apply:

"Alliant" means Alliant Techsystems Inc., as well as its directors, officers, employees, representatives, agents, parents, divisions, subsidiaries, successors, and assigns, as well as the directors, officers, employees and agents of its parents, divisions and subsidiaries, successors, and assigns.

"Olin" means Olin Corporation, as well as its directors, officers, employees, representatives, agents, parents, divisions, subsidiaries, successors, and assigns, as well as the directors, officers, employees and agents of its parents, divisions and subsidiaries, successors, and assigns.

"Systems contractor for 30mm lightweight ammunition or 120mm tank ammunition" means any company that supplies or has supplied completed rounds of 30mm lightweight ammunition or completed rounds of 120mm tank ammunition to any customer in the United States, including but not limited to the United States Army, or that is developing completed rounds of 30mm lightweight ammunition or completed rounds of 120mm tank ammunition for any customer in the United States, including but not limited to the United States Army.

II.

It is ordered That, for a period commencing on the date this Order becomes final and continuing for ten (10) years, Alliant shall not, without the prior approval of the Commission, directly or indirectly, through subsidiaries or otherwise, acquire: (1) Any interest in the whole or any part of the stock, share capital, or equity of any systems contractor for 33mm lightweight ammunition or 120mm tank ammunition; or (2) any assets of a systems contractor for 30mm lightweight ammunition or 120mm tank ammunition. *Provided*, however, that this Paragraph II shall not apply to the acquisition of products or services in the ordinary course of business.

III.

It is further ordered That, for a period commencing on the date this Order becomes final and continuing for ten (10) years, Alliant shall not, without the prior approval of the Commission, directly or indirectly, through subsidiaries or otherwise, sell or otherwise transfer to any systems contractor for 30mm lightweight ammunition or 120mm tank ammunition: (1) Any interest in or any part of the stock, share capital, or equity of Alliant, or (2) any assets used for or previously used for (and still suitable for use for) systems contracting of 30mm lightweight ammunition or 120mm tank ammunition. *Provided*, however, that this Paragraph III shall not apply to the sale of products or services in the ordinary course of business.

IV.

It is further ordered That, for a period commencing on the date this Order becomes final and continuing for ten (10) years, Alliant shall notify the Commission at least thirty (30) days prior to any proposed change in the corporation that may affect compliance obligations arising out of the Order, such as dissolution, assignment or sale resulting in the emergence of a successor corporation, the creation or

dissolution of any subsidiary engaged as systems contractor for 30mm lightweight ammunition or 120mm tank ammunition, or any other change that may affect compliance obligations arising out of the Order.

V.

It is further ordered That, unless Alliant has already done so, it will, not later than fourteen (14) days after this Order becomes final: (1) Terminate any agreement that provides for or contemplates the acquisition of, or exchange of stock for, Olin's Ordnance Division and/or its Physics International Subsidiary, including but not limited to the transaction agreement signed on or about August 4, 1992; (2) return or destroy all documents containing or recording confidential information provided to Alliant by Olin in connection with acquisition negotiations or agreements; and (3) recover from Olin or have Olin destroy all documents containing or recording confidential information provided by Olin by Alliant in connection with acquisition negotiations or agreements. Nothing herein contained shall relieve Alliant from any obligation of confidentiality imposed by agreement among Alliant and Olin.

VI.

It is further ordered That Alliant shall, within sixty (60) days after the date this Order becomes final, file with the Commission a report, in writing, setting forth in detail the manner and form in which it has complied with this Order. Within one year after the Order becomes final, and annually for the next nine years. Alliant shall submit to the Commission a verified written report setting forth in detail the manner and form in which it intends to comply, is complying, or has complied with the Order.

Analysis of Proposed Consent Order To Aid Public Comment

The Federal Trade Commission ("Commission") has accepted provisionally an agreement containing a proposed consent order from Alliant Techsystems Inc. ("Alliant"), concerning Alliant's proposed acquisition of Olin Corporation's ("Olin") Ordnance Division and Physics International Company. Olin is Alliant's only competitor in systems contracting for 120mm tank ammunition and 30 mm lightweight ammunition in the United States. The proposed order requires Alliant to seek prior approval for certain mergers or acquisitions for a period of ten (10) years.

The proposed consent order has been placed on the public record for sixty (60) days for reception of comments by interested persons. Comments received during this period will become part of the public record. After sixty (60) days, the Commission will again review the agreement and the comments received and will decide whether it should withdraw from the agreement or make final the agreement's proposed order.

On or about August 4, 1992, Alliant and Olin signed a definitive agreement under which Olin would exchange its Ordnance Division and Physics International subsidiary for approximately 2.82 million shares of newly issued Alliant common stock plus Alliant's assumption of $65 million of Olin debt. On November 6, 1992, the Federal Trade Commission filed a preliminary injunction action against Alliant in the United States District Court for the District of Columbia to enjoin the proposed acquisition. The Commission won a preliminary injunction on November 18, 1992; the district court's supplemental opinion supporting the injunction was issued on November 23, 1992. The court found that the merger would preclude the Army from conducting a competitive bid for an upcoming multiyear contract, and that the anticompetitive effects of the merger were not counterbalanced by competing efficiency and other considerations alleged by defendants. *FTC* v. *Alliant Techsystems Inc.*, Civ. Action No. 92–2499–LFO, Supplemental Memorandum at 6–7, 21–22, 25–28 (November 23, 1992).

On December 7, 1992, the Commission issued an administrative complaint against Alliant which alleges that Alliant's proposed acquisition of Olin violates section 5 of the Federal Trade Commission Act, 15 U.S.C. 45, as amended, and that, if consummated, such acquisition would violate section 7 of the Clayton Act, 15 U.S.C. 18, as amended, and section 5 of the Federal Trade Commission Act, 15 U.S.C. 45, as amended. The complaint alleges that both Alliant and Olin are competitors in systems contracting for 120mm tank ammunition and 30mm lightweight ammunition in the United States. The complaint alleges that these markets are highly concentrated and that entry into the markets is difficult or unlikely. The complaint alleges that the effect of the proposed acquisition may be substantially to lessen competition or tend to create a monopoly in the relevant markets in the United States.

The first paragraph of the proposed order defines the terms "Alliant," "Olin" and "system contractor for 30mm lightweight ammunition or 120mm tank ammunition" as used in the order. Paragraph II bans Alliant from acquiring, directly or indirectly, without the prior approval of the Federal Trade Commission, any stock or assets of any company engaged in systems contracting for 30mm lightweight or 120mm tank ammunition in the United States. Paragraph III bans Alliant from selling or transferring its stock or assets to a company engaged in systems contracting for 30mm lightweight or 120mm tank ammunition without the prior approval of the Federal Trade Commission. These bans last for a period of ten (10) years from the date the order becomes final.

Paragraph IV of the proposed order requires that Alliant notify the Commission at least thirty (30) days prior to any proposed change in the corporation, such as dissolution, assignment or sale resulting in the emergence of a successor corporation, the creation or dissolution of any subsidiary engaged in systems contracting for 30mm lightweight or 120mm tank ammunition in the United States, or any other change that may affect compliance obligations arising out of the Order.

Paragraph V of the proposed order requires that within fourteen (14) days after the order becomes final, Alliant must terminate its proposed acquisition of Olin. Additionally, Alliant must return or destroy any documents containing confidential information obtained from Olin and recover or have Olin destroy any confidential documents Alliant supplied to Olin.

Paragraph VI of the proposed order requires Alliant to file with the Commission, within sixty (60) days after service of the order, a report, in writing, setting for in detail the manner and form in which it has complied with this order. Alliant is also required to file with the Commission annual reports detailing its compliance with the order.

The agreement is for settlement purposes only and does not constitute an admission by Alliant that the law has been violated as alleged in the complaint issued by the Commission.

The purpose of this analysis is to facilitate public comment on the proposed order, and it is not intended to constitute an official interpretation of the agreement and proposed order or to modify in any way their terms.

Benjamin I. Berman,

Acting Secretary.

BILLING CODE 6750–01–M

[Docket C–3406]

American Psychological Association; Prohibited Trade Practices, and Affirmative Corrective Actions

AGENCY: Federal Trade Commission.

ACTION: Consent order.

SUMMARY: In settlement of alleged violations of federal law prohibiting unfair acts and practices and unfair methods of competition, this consent order prohibits, among other things, a Washington, DC association from restricting the dissemination of truthful, non-deceptive information by its members. In addition, the respondent is prohibited from banning payments by psychologists to patient-referral services. Finally, the respondent must cease its affiliation with any state, regional or other psychological association that imposes similar restrictions.

DATES: Complaint and Order issued December 16, 1992. [1]

FOR FURTHER INFORMATION CONTACT: Elizabeth R. Hilder, FTC/S–3115, Washington, DC 20580. (202) 326–2545.

SUPPLEMENTARY INFORMATION: On Tuesday, October 6, 1992, there was published in the **Federal Register**, 57 FR 46028, a proposed consent agreement with analysis In the Matter of American Psychological Association, for the purpose of soliciting public comment. Interested parties were given sixty (60) days in which to submit comments, suggestions or objections regarding the proposed form of the order.

No comments having been received, the Commission has ordered the issuance of the complaint in the form contemplated by the agreement, made its jurisdictional findings and entered an order to cease and desist, as set forth in the proposed consent agreement, in disposition of this proceeding.

(Sec. 6, 38 Stat. 721; 15 U.S.C. 46. Interprets or applies sec. 5, 38 Stat. 719, as amended; 15 U.S.C. 45)

[File No. 902 3145]

CC Pollen Company, et al.; Proposed Consent Agreement With Analysis To Aid Public Comment

AGENCY: Federal Trade Commission.

ACTION: Proposed consent agreement.

SUMMARY: In settlement of alleged violations of Federal law prohibiting unfair acts and practices and unfair methods of competition, this consent agreement, accepted subject to final Commission approval, would prohibit, among other things, a Phoenix-based firm, and its owners, from making false claims about the effect consumption of their bee pollen products has in regard to allergies, aging, impotence, sexual disfunction, weight loss and antibiotic treatment, and require that they have scientific evidence to support any other health-benefit claims they make about any food or other product for human consumption, in the future. In addition, the respondents would be prohibited from producing or distributing any advertisement that is represented to be something other than a paid ad, and required to prominently disclose in all future infomercials they create that the programs are paid ads. Finally, the respondents would be required to pay $200,000 as disgorgement of profits.

DATES: Comments must be received on or before March 8, 1993.

ADDRESSES: Comments should be directed to: FTC/Office of the Secretary, room 159, 6th St. and Pa. Ave., NW., Washington, DC 20580.

FOR FURTHER INFORMATION CONTACT: Brinley Williams, Cleveland Regional Office, Federal Trade Commission, 668 Euclid Avenue, Suite 520–A, Cleveland, OH 44114, (216) 522–4210.

SUPPLEMENTARY INFORMATION: Pursuant to section 6(f) of the Federal Trade Commission Act, 38 Stat. 721, 15 U.S.C. 46 and § 2.34 of the Commission's Rules of Practice (16 CFR 2.34), notice is hereby given that the following consent agreement containing a consent order to cease and desist, having been filed with and accepted, subject to final approval, by the Commission, has been placed on the public record for a period of sixty (60) days. Public comment is invited. Such comments or views will be considered by the Commission and will be available for inspection and copying at its principal office in accordance with § 4.9(b)(6)(ii) of the Commission's Rules of Practice (16 CFR 4.9(b)(6)(ii)).

Agreement Containing Consent Order To Cease and Desist

The Federal Trade Commission having initiated an investigation of certain acts and practices of C C Pollen Company, a corporation, and Bruce R. Brown, Carol M. Brown, and Royden Brown, individually and as officers of said corporation, hereinafter sometimes referred to as proposed respondents, and it now appearing that proposed respondents are willing to enter into an agreement containing an Order to Cease and Desist from the use of the acts or practices being investigated.

It is hereby agreed by and between proposed respondents and their attorney and counsel for the Federal Trade Commission that:

1. Proposed respondents C C Pollen Company, a corporation, and Bruce R. Brown, Carol M. Brown, and Royden Brown, individually and as officers of said corporation, have an office or principal place of business located at 3627 East Indian School Road, Suite 209, Phoenix, Arizona 85018.

2. Proposed respondents admit all the jurisdictional facts set forth in the draft Compliant here attached.

3. Proposed respondent waive:

(a) Any further procedural steps;

(b) The requirement that the Commission's Decision contain a statement of findings of fact and conclusions of law;

(c) All rights to seek judicial review or otherwise to challenge or contest the validity of the Order entered pursuant to this Agreement; and

(d) All claims under the Equal Access to Justice Act.

4. This Agreement shall not become part of the public record of the proceeding unless and until it is accepted by the Commission. If this Agreement is accepted by the Commission, it, together with the draft Complaint contemplated thereby, will be placed on the public record for a period of sixty (60) days and information with respect thereto publicly released. The Commission thereafter may either withdraw its acceptance of this Agreement and so notify proposed respondents, in which event it will take such action as it may consider appropriate, or issue and serve its Complaint (in such form as the circumstances may require) and Decision, in disposition of the proceeding.

5. This Agreement is for settlement purposes only and does not constitute an admission by proposed respondents of facts other than jurisdictional facts, or of violations of law as alleged in the draft Complaint here attached.

6. This Agreement contemplates that, if it is accepted by the Commission, and if such acceptance is not subsequently withdrawn by the Commission pursuant to the provisions of § 2.34 of the

Commission's Rules, the Commission may, without further notice to proposed respondents, (1) issue its Complaint corresponding in form and substance with the draft Complaint and its Decision containing the following Order to Cease and Desist in disposition of the proceeding, and (2) make information public with respect thereto. When so entered, the Order to Cease and Desist shall have the same force and effect and may be altered, modified, or set aside in the same manner and within the same time provided by statute for other orders. The Order shall become final upon service. Delivery by the United States Postal Service of the Complaint and Decision containing the agreed-to Order to proposed respondents' address as stated in this Agreement shall constitute service. Proposed respondents waive any right they may have to any other manner of service. The Complaint attached thereto may be used in construing the terms of the Order. No agreement, understanding, representation, or interpretation not contained in the Order or the Agreement may be used to vary or contradict the terms of the Order.

7. Proposed respondents have read the proposed Complaint and Order contemplated hereby. They understand that once the Order has been issued, they will be required to file one or more compliance reports showing that they have fully complied with the Order. Proposed respondents further understand that they may be liable for civil penalties in the amount provided by law for each violation of the Order after it becomes final.

Order

The following definition shall apply throughout this Order:

Bee pollen product means any product(s) intended for human consumption or use consisting in whole or in part of bee pollen, bee propolis, and/or royal jelly in any form.

I

It is Ordered That respondents CC Pollen Company, a corporation, and Bruce R. Brown, Carol M. Brown, and Royden Brown, individually and as officers of said corporation, their successors and assigns, and their officers, agents, representatives and employees, directly or through any partnership, corporation, subsidiary, division or other device in connection with the advertising, packaging, labeling, promotion, offering for sale, sale or distribution of any product or service in or affecting commerce, as "commerce" is defined in the Federal Trade Commission Act, do forthwith cease and desist from creating, producing, selling or disseminating:

(A) Any advertisement that misrepresents, directly or by implication, that is not a paid advertisement; and

(B) Any commercial or other video advertisement fifteen (15) minutes in length or longer, or intended to fill a broadcasting or cablecasting time slot of fifteen (15) minutes in length or longer, that does not display visually, in a clear and prominent manner and for a length of time sufficient for an ordinary consumer to read, within the first thirty (30) seconds of the commercial and immediately before each presentation of ordering instructions for the product or service, the followlng disclosure:

The program you are watching is a paid advertisement for [the product or service].

Provided that, for the purposes of this provision, the oral or visual presentation of a telephone number or address for viewers to contact to place an order for the product or service shall be deemed a presentation of ordering instructions so as to require the display of the disclosure provided herein.

Provided further That should the Federal Trade Commission adopt a trade regulation rule requiring different disclosures or a different frequency of making such disclosures than that required by subpart I(B), above, compliance with such trade regulation rule shall be deemed compliance with subpart I(B).

II

It is further ordered That respondents C C Pollen Company, a corporation, and Bruce R. Brown, Carol M. Brown, and Royden Brown, individually and as officers of said corporation, their successors and assigns, and their officers agents, representatives and employees, directly or through any partnership, corporation, subsidiary, division or other device, in connection with the advertising, offering for sale, sale or distribution of any bee pollen product in or affecting commerce, as "commerce" is defined in the Federal Trade Commission Act, do forthwith cease and desist from representing, directly or by implication, that:

(A) Consumption of any been pollen product cannot or will not result in an allergic reaction;

(B) Consumption of any bee pollen product will permanently alleviate all pollen allergy symptoms;

(C) Consumption of any bee pollen product slows or prevents or reverse the aging process;

(D) Consumption of any bee pollen product can cure, or prevent, or alleviate impotence and/or sexual dysfunction;

(E) Consumption of any been pollen product can cause weight loss;

(F) Any bee pollen product is an effective antibiotic for human use.

Provided, however, That use of any statement approved by the United States Food and Drug Administration ("FDA") for inclusion on the above label of the product will be deemed not to violate this part when its use is consistent with the FDA approval.

III

It is further ordered That respondents C C Pollen Company, a corporation, and Bruce R. Brown, Carol M. Brown, and Royden Brown, individually and as officers of said corporation, their successors and assigns, and their officers, agents, representatives and employees, directly or through any partnership, corporation, subsidiary, division or other device, in connection with the advertising, offering for sale, sale or distribution of any product or service for human consumption or use, in or affecting commerce, as "commerce" is defined in the Federal Trade Commission Act, do forthwith cease and desist from representing, directly or by implication, that any such product or service will have any effect on the user's health or physical condition unless, at the time of making such representation, respondents possess and rely upon competent and reliable scientific evidence that substantiates the representation. For purposes of this Order, "competent and reliable scientific evidence" shall mean tests, analyses, research, studies or other evidence based on the expertise of professionals in the relevant area that have been conducted and evaluated in an objective manner by persons qualified to do so, using procedures generally accepted by others in the profession to yield accurate and reliable results.

IV

It is further ordered That respondents, their successors and assigns, shall pay Two Hundred Thousand Dollars ($200,000) to the United States Treasury as disgorgement. Such payment shall be by two cashier's checks or certified checks made payable to the Treasurer of the United States, the first such check, in the amount of One Hundred Thousand Dollars ($100,000), to be tendered within five (5) days of the date of service of this Order, and the second, also in the amount of One Hundred Thousand Dollars ($100,000), to be tendered no later than one year to the day after this Agreement becomes final. Respondents shall provide security for the second payment in a manner agreed to by the parties before provisional acceptance of this Order by the Federal Trade Commission. In the event of any default in payment, which default continues for more than ten (10) days beyond the due date of payment, respondents shall also pay interest as computed under 28 U.S.C. 1961, which shall accrue on the unpaid balance from the date of default until the date the balance is fully paid.

V

It is further ordered That for a period of three (3) years from the date that a representation covered by this Order is last disseminated, respondents shall maintain and upon request make available to the Federal Trade Commission for inspection and copying:

(A) All materials that were relied upon by respondents in disseminating any representation covered by this Order; and

(B) All reports, tests, studies, surveys, demonstrations or other evidence in any respondent's possession or control that contradict, qualify or call into question such representation or the basis upon which respondents relied for such representation, including complaints from consumers.

VI

It is further ordered That respondent CC Pollen Company shall:

(A) Within thirty (30) days after service of this Order, provide a copy of this Order to each of respondent's current principals,

officers, directors and managers, and provide a complete copy of Parts I through III of this Order to all personnel, agents and representatives having advertising or policy responsibility with respect to the subject matter of this Order, and to each employee of CC Pollen Company who is engaged in the sale of CC Pollen products; and

(B) For a period of seven (7) years from the date of entry of this Order, provide a copy of this Order to each of respondent's principals, officers, directors and managers, and provide a complete copy of Parts I through III of this Order to all personnel, agents and representatives having advertising or policy responsibility with respect to the subject matter of this Order, and to each employee of CC Pollen Company who is engaged in the sale of CC Pollen products, within three (3) days after the person assumes his or her position.

VII

It is further ordered That respondent CC Pollen Company shall notify the Commission at least thirty (30) days prior to the effective date of any proposed change in the corporate respondent such as dissolution, assignment or sale resulting in the emergence of a successor corporation, the creation or dissolution of subsidiaries, or any other change in the corporation which may affect compliance obligations arising out of this Order.

VIII

It is further ordered That respondents Bruce R. Brown, Carol M. Brown, and Royden Brown shall, for a period of seven (7) years from the date of entry of this Order, notify the Federal Trade Commission within thirty (30) days of the discontinuance of his or her present business or employment and of his or her affiliation with any new business or employment. Each notice of affiliation with any new business or employment shall include the respondent's new business address and telephone number, current home address, and a statement describing the nature of the business or employment and his or her duties and responsibilities.

IX

It is further ordered That respondents shall, for at least three (3) years after service of this Order, maintain and make available to the Federal Trade Commission upon request, for inspection and copying, complete records regarding respondents' compliance with this Order.

X

It is further ordered That respondents shall, within sixty (60) days after service of this Order, and at such other times as the Federal Trade Commission may require, file with the Commission a report, in writing, setting forth in detail the manner and form in which they have complied with this Order.

Analysis of Proposed Consent Order To Aid Public Comment

The Federal Trade Commission has accepted, subject to final approval, an agreement to a proposed Consent Order from C C Pollen Company and its principals, Royden Brown, Bruce Brown and Carol Brown.

The proposed Consent Order has been placed on the public record for sixty (60) days for receipt of comments by interested persons. Comments received during this period will become part of the public record. After sixty (60) days, the Commission will again review the agreement and the comments received and will decide whether it should withdraw from the agreement and take other appropriate action, or make final the proposed Order contained in the agreement.

This matter concerns two program-length television advertisements for C C Pollen's bee pollen products, *TV Insiders* and *The Search for the Fountain of Youth*, as well as C C Pollen's print advertisements for these products.

The Complaint alleges that C C Pollen Company engaged in deceptive advertising in violation of section 5 of the Federal Trade Commission Act by falsely claiming that the television advertisements were not paid-for advertisements but rather were independent and objective documentary or news programs.

The Complaint also alleges that C C Pollen violated sections 5 and 12 of the FTC Act by making false and unsubstantiated claims that consumption of any bee pollen product cannot result in an allergic reaction; that consumption of C C Pollen Company's bee pollen products will permanently alleviate all of the consumer's pollen allergy symptoms; that consumption of bee pollen products slows or prevents or reverses the aging process; that consumption of bee pollen products can cure, or prevent, or alleviate impotence and/or sexual dysfunction; that consumption of bee pollen products causes weight loss; and that bee pollen projects, such as those advertised by C C Pollen Company, are an effective antibiotic for human use.

The Complaint further alleges that C C Pollen falsely implied that it had a reasonable basis for each of these claims. According to the Complaint, C C Pollen did not have a reasonable basis for making these claims.

The Consent Order contains provisions designed to prevent future misrepresentations concerning the nature of C C Pollen's program-length advertisements. Paragraph I of the Order prohibits C C Pollen and the three named officers of the company from misrepresenting that any advertisement is an independent program, and not an advertisement. Paragraph I also provides that any television advertisement 15 minutes or more in length must contain a clear and prominent visual message which states that the program is a paid advertisement. The disclosure must be made at the beginning of the advertisement and prior to any ordering instructions.

Paragraph II of the Order prohibits respondents from claiming that consumption of any bee pollen product cannot or will not result in an allergic reaction; that consumption of any bee pollen product will permanently alleviate all pollen allergy symptoms; that consumption of any bee pollen product slows or prevents or reverses the aging process; that consumption of any bee pollen product can cure, or prevent, or alleviate impotence and/or sexual dysfunction; that consumption of any bee pollen product can cause weight loss; and that any bee pollen product is an effective antibiotic for human use.

Paragraph III requires substantiation consisting of competent and reliable scientific evidence for all future claims concerning any product for human use or consumption having any effect on the user's health or physical condition.

Paragraph IV requires the respondents to pay to the United States Treasury Two Hundred-Thousand Dollars ($200,000) as disgorgement, with $100,000 to be paid within five days of the date of service of the Order and the remaining $100,000 to be paid within one year after the Order becomes final.

The remainder of the Order contains standard record-retention and notification provisions.

The purpose of this analysis is to facilitate public comment on the proposed Order. It is not intended to constitute an official interpretation of the agreement and proposed Order or to modify in any way their terms.

Benjamin I. Berman,

Acting Secretary.

BILLING CODE 6750–01–M

[File No. 922 3155]

Alan V. Phan, d/b/a Harcourt Companies; Proposed Consent Agreement With Analysis To Aid Public Comment

AGENCY: Federal Trade Commission.

ACTION: Proposed consent agreement.

SUMMARY: In settlement of alleged violations of federal law prohibiting unfair acts and practices and unfair methods of competition, this consent agreement, accepted subject to final Commission approval, would prohibit,

among other things, a California marketer of "Jazz cigarettes", a non-tobacco product, from representing that smoking such products poses no health risk, that smoking such products does not pose any of the health risks associated with smoking cigarettes, and that the smoke contains no tar. In addition, the respondent would be prohibited from making any representations about the comparative or absolute health or safety attributes, benefits or risks of any cigarette or smoking product, unless it is substantiated by reliable scientific evidence.

DATES: Comments must be received on or before March 8, 1993.

ADDRESSES: Comments should be directed to: FTC/Office of the Secretary, room 159, 6th St. and Pa. Ave., NW., Washington, DC 20580.

FOR FURTHER INFORMATION CONTACT: Jeffrey Klurfeld or Kerry O'Brien, San Francisco Regional Office, Federal Trade Commission, 901 Market St., Suite 570, San Francisco, CA 94103. (415) 744–7920.

SUPPLEMENTARY INFORMATION: Pursuant to section 6(f) of the Federal Trade Commission Act, 38 Stat. 721, 15 U.S.C. 46 and § 2.34 of the Commission's Rules of Practice (16 CFR 2.34), notice is hereby given that the following consent agreement containing a consent order to cease and desist, having been filed with and accepted, subject to final approval, by the Commission, has been placed on the public record for a period of sixty (60) days. Public comment is invited. Such comments or views will be considered by the Commission and will be available for inspection and copying at its principal office in accordance with § 4.9(b)(6)(ii) of the Commission's Rules of Practice (16 CFR 4.9(b)(6)(ii)).

Agreement Containing Consent Order To Cease and Desist

In the Matter of Alan V. Phan, a/k/a Alan V. Pasqualle, an individual trading and doing business as Harcourt Companies.

The Federal Trade Commission having initiated an investigation of certain acts and practices of Alan V. Phan, an individual trading and doing business as Harcourt Companies ("proposed respondent"), and it is now appearing that proposed respondent is willing to enter into an agreement containing an order to cease and desist from the acts and practices being investigated,

It is hereby agreed By and between Alan V. Phan and counsel for the Federal Trade Commission that:

1. Proposed respondent Alan V. Phan is the owner of Harcourt Companies, a California sole proprietorship. His principal office and place of business is located at 10915 Bloomfield Avenue, Los Alamitos, CA 90720.

2. Proposed respondent admits all the jurisidictional facts set forth in the draft complaint here attached.

3. Proposed respondent waives:

a. Any further procedural steps;

b. The requirement that the Commission's decision contain a statement of findings of fact and conclusions of law;

c. All rights to seek judicial review or otherwise to challenge or contest the validity of the order entered pursuant to this agreement; and

d. All claims under the Equal Access to Justice Act, 5 U.S.C. 504.

4. This agreement shall not become part of the public record of the proceeding unless and until it is accepted by the Commission. If this agreement is accepted by the Commission, it, together with the draft of complaint contemplated thereby, will be placed on the public record for a period of sixty (60) days and information in respect thereto publicly released. The Commission thereafter may either withdraw its acceptance of this agreement and so notify the proposed respondent, in which event it will take such action as it may consider appropriate, or issue and serve its complaint (in such form as the circumstances may require) and decision, in disposition of the proceeding.

5. This agreement is for settlement purposes only and does not constitute an admission by proposed respondent of facts, other than jurisdictional facts, or of violations of law as alleged in the draft of complaint here attached.

6. This agreement contemplates that, if it is accepted by the Commission, and if such acceptance is not subsequently withdrawn by the Commission pursuant to the provisions of § 2.34 of the Commission's Rules, the Commission may, without further notice to proposed respondent, (a) issue its complaint corresponding in form and substance with the draft of complaint here attached and its decision containing the following order to cease and desist in disposition of the proceeding and (b) make information public in respect thereto. When so entered, the order to cease and desist shall have the same force and effect and may be altered, modified or set aside in the same manner and within the same time provided by statute for other orders. The order shall become final upon service. Delivery by the U.S. Postal Service of the complaint and decision containing the agreed-to order to proposed respondent's address as stated in this agreement shall constitute service. Proposed respondent waives any right he may have to any other manner of service. The complaint may be used in construing the terms of the order, and no agreement, understanding, representation, or interpretation not contained in the order or the agreement may be used to vary or contradict the terms of the order.

7. Proposed respondent has read the proposed complaint and order contemplated hereby. Proposed respondent understands that once the order has been issued, he will be required to file one or more compliance reports showing that he has fully complied with the order. Proposed respondent further understands that he may be liable for civil penalties in the amount provided by law for each violation of the order after it becomes final.

Order

I.

It is ordered That respondent Alan V. Phan, an individual trading and doing business as Harcourt Companies, and his successors and assigns, in connection with the manufacturing, labelling, advertising, promotion, offering for sale, sale, or distribution of Jazz or any product containing substantially similar ingredients, in or affecting commerce, as "commerce" is defined in the Federal Trade Commission Act, do forthwith cease and desist from representing, in any manner, directly or by implication, that:

A. Smoking such product poses no health risk for the user.

B. Smoking such product does not pose any of the health risks associated with smoking tobacco cigarettes.

C. Such product's smoke contains no "tar."

It is further ordered That respondent Alan V. Phan, an individual trading and doing business as Harcourt Companies, and his successors and assigns, in connection with the manufacturing, labelling, advertising, promotion, offering for sale, sale, or distribution of any smoking product, in or affecting commerce, as "commerce" is defined in the Federal Trade Commission Act, do forthwith cease and desist from making any misrepresentation, in any manner, directly or by implication, regarding the display of health warnings required by the Federal Cigarette Labeling and Advertising Act.

III.

It is further ordered That respondent Alan V. Phan, an individual trading and

doing business as Harcourt Companies, and his successors and assigns, in connection with the manufacturing, labelling, advertising, promotion, offering for sale, sale, or distribution of any cigarette, as defined in 15 U.S.C. 1332, or any other smoking product, in or affecting commerce, as "commerce" is defined in the Federal Trade Commission Act, do forthwith cease and desist from representing, in any manner, directly or by implication, the comparative or absolute health or safety attributes, benefits, or risks associated with smoking such product, unless such representation is true and, at the time of making such representation, respondent possesses and relies upon competent and reliable scientific evidence that substantiates the representation. For purposes of this Order, "competent and reliable scientific evidence" shall mean tests, analyses, research, studies or other evidence based on the expertise of professionals in the relevant area, that has been conducted and evaluated in an objective manner by persons qualified to do so, using procedures generally accepted in the profession to yield accurate and reliable results.

IV.

It is further ordered That respondent Alan V. Phan, an individual trading and doing business as Harcourt Companies, and his successors and assigns, in connection with the manufacturing, labelling, advertising, promotion, offering for sale, sale, or distribution of any product in or affecting commerce, as "commerce" is defined in the Federal Trade Commission Act, do forthwith cease and desist from representing, in any manner, directly or by implication, that using such product is effective in aiding people to quit smoking tobacco products, unless, at the time of making such representation, respondent possesses and relies upon competent and reliable scientific evidence that substantiates the representation.

V.

It is further ordered That respondent shall:

A. Within thirty (30) days from the date of service of this Order, distribute a copy of the Complaint and Order to each past or present distributor of Jazz.

B. Distribute a copy of the Complaint and Order to each new distributor of Jazz within thirty (30) days of the date that individual or entity becomes a distributor;

C. Distribute a copy of the Complaint and Order to each future purchaser of Jazz, or any other transferee, who acquires, with or without valuable consideration, more than thirty (30) cartons of Jazz.

D. For ten (10) years from the date of service of this Order, distribute a copy of the Complaint and Order to each managerial employee of respondent, and to each salesperson of respondent's products, whether they are independent sales agents or employees of respondent.

E. Within ten (10) days from the date of service of this Order, distribute a copy of the Complaint and Order to any individual or entity who is involved in the preparation and placement of advertisements or promotional materials, or communicates with customers or prospective customers regarding the efficacy or safety of any product covered by this Order.

VI.

It is further ordered That for five (5) years after the last date of dissemination of any representation covered by this Order, respondent, or his successors and assigns, shall maintain and upon request make available to the Federal Trade Commission for inspection and copying:

A. All materials that were relied upon in disseminating such representation; and

B. All test, reports, studies, surveys, demonstrations or other evidence in his possession or control that contradict, qualify, or call into question such representation, or the basis relied upon for such representation, including complaints from consumers.

VII.

It is further ordered That respondent shall, for a period of ten (10) years after the date of service of this Order upon him, promptly notify the Commission, in writing, of his discontinuance of his present business or employment and of his affiliation with a new business or employment. For each such new affiliation, the notice shall include the name and address of the new business or employment, a statement of the nature of the new business or employment, and a description of respondent's duties and responsibilities in connection with the new business or employment.

VIII.

It is further ordered That respondent shall, within sixty (60) days from the date of service of this Order upon them, and at such other times as the Commission may require, file with the Commission a report, in writing, setting forth in detail the manner and form in which they have complied with this Order.

Analysis of Proposed Consent Order to Aid Public Comment

The Federal Trade Commission has accepted an agreement, subject to final approval, to a proposed consent order from respondent Alan V. Phan, an individual trading and doing business as Harcourt Companies.

The proposed consent order has been placed on the public record for sixty (60) days for reception of comments by interested persons. Comments received during this period will become part of the public record. After sixty (60) days, the Commission will again review the agreement and the comments received and will decide whether it should withdraw from the agreement and take other appropriate action or make final the agreement's proposed order.

This matter concerns the advertising of "Jazz Cigarettes" ("Jazz"), a nontobacco product. Because Jazz does not contain tobacco, it is not a "cigarette," as that term is defined in the Federal Cigarette Labeling and Advertising Act, 15 U.S.C. 1332. The Commission's complaint charges that respondent's advertising contained false and unsubstantiated representations concerning the health risks associated with smoking Jazz, and Jazz's efficacy in helping people to quit smoking tobacco products.

Specifically, the complaint alleges that respondent falsely represented that: (1) Smoking Jazz poses no health risk for the user; (2) smoking Jazz does not pose any of the health risks associated with smoking tobacco cigarettes; (3) Jazz smoke contains no tar; and (4) Jazz packages do not display the Surgeon General's health warnings because smoking Jazz does not pose the health and safety risks that have been associated with smoking tobacco cigarettes. The complaint also alleges that respondent lacked substantiation for his claim that smoking Jazz is effective in aiding people to quit smoking tobacco products.

The proposed consent order contains provisions designed to remedy the violations charged and to prevent the respondent from engaging in similar acts and practices in the future.

Part I of the proposed order prohibits respondent from representing that (1) smoking Jazz poses no health risk for the user; (2) smoking Jazz does not pose any of the health risks associated with smoking tobacco cigarettes; and (3) Jazz's smoke contains no tar. Part I of the proposed order also covers these representations when made about a product that contains substantially similar ingredients as those contained in Jazz.

Part II of the proposed order prohibits respondent from making any misrepresentation regarding the display of health warnings required by the Federal Cigarettes Labeling and Advertising Act on any smoking product.

As fencing-in relief, Part III of the proposed order provides that if respondent represents that comparative or absolute health or safety attributes, benefits, or risks associated with smoking any cigarette or any other smoking product, the representation must be true and respondent must possess competent and reliable scientific evidence that substantiates the representation.

Part IV of the proposed order provides that if respondent represents that a product helps people to quit smoking tobacco products, respondent must possess competent and reliable scientific evidence that substantiates the representation.

The proposed order also requires respondent to maintain materials relied upon to substantiate claims covered by the order, to distribute copies of the order to past, present and future distributors of Jazz, to distribute copies of the order to certain future purchasers of Jazz, to notify the Commission of certain changes in respondent's business or employment, and to file one or more reports detailing compliance with the order.

The purpose of this analysis is to facilitate public comment on the proposed order. It is not intended to constitute an official interpretation of the agreement and proposed order or to modify in any way their terms.

S.C. Johnson & Son, Inc.; Proposed Consent Agreement with Analysis To Aid Public Comment

AGENCY: Federal Trade Commission.

ACTION: Proposed Consent Agreement.

SUMMARY: In settlement of alleged violations of federal law prohibiting unfair acts and practices and unfair methods of competition, this consent agreement, accepted subject to final Commission approval, would require, among other things, a Wisconsin-based manufacturer of home care products to divest its assets used in the production, manufacture and sale of continuous action and aerosol air freshener products and furniture care products, in order to acquire certain assets of the Drackett Company, a subsidiary of Bristol-Myers Squibb Company. In addition, for a 10-year period, Johnson must obtain Commission approval before acquiring any interest in any air freshener or furniture care product manufacturer or distributor.

DATES: Comments must be received on or before March 8, 1993.

ADDRESSES: Comments should be directed to: FTC/Office of the Secretary, room 159, 6th St. and Pa. Ave., NW., Washington, DC 20580.

FOR FURTHER INFORMATION CONTACT: Steven A. Newborn, FTC/S–2308, Washington, DC 20580. (202) 326–2682.

SUPPLEMENTARY INFORMATION: Pursuant to section 6(f) of the Federal Trade Commission Act, 38 Stat. 721, 15 U.S.C. 46 and Section 2.34 of the Commission's Rules of Practice (16 CFR 2.34), notice is hereby given that the following consent agreement containing a consent order to cease and desist, having been filed with and accepted, subject to final approval, by the Commission, has been placed on the public record for a period of sixty (60) days. Public comment is invited. Such comments or views will be considered by the Commission and will be available for inspection and copying at its principal office in accordance with § 4.9(b)(6)(ii) of the Commission's Rules of Practice (16 CFR 4.9(b)(6)(ii)).

Agreement Containing Consent Order

In the matter of S.C. Johnson & Son, Inc. a corporation.

The Federal Trade Commission ("Commission") having initiated an investigation of the proposed acquisition by S.C. Johnson & Son, Inc. ("Johnson"), a corporation, of all the voting securities of The Drackett Company ("Drackett"), from Bristol-Myers Squibb Company ("BMS"), a corporation, and certain assets of BMS relating to Drackett's international business, and it now appearing that Johnson, hereinafter sometimes referred to as "proposed respondent", is willing to enter into an Agreement Containing Consent Order ("Agreement") to divest certain assets, to cease and desist from certain acts, and to provide for certain other relief.

It is Hereby Agreed by and between Johnson, by its duly authorized officers and its attorneys, and counsel for the Commission that:

1. Proposed respondent Johnson is a corporation organized, existing, and doing business under and by virtue of the laws of the State of Wisconsin, with its office and principal place of business located at 1525 Howe Street, Racine, Wisconsin 53403–5011.

2. BMS is a corporation, organized, existing, and doing business under and by virtue of the laws of the State of

[1] Copies of the Complaint and the Decision and Order are available from the Commission's Public Reference Branch, H–130, 6th Street & Pennsylvania Avenue, NW., Washington, DC 20580.

Delaware, with its office and principal place of business located at 345 Park Avenue, New York, New York 10154–0037.

3. Drackett is a corporation, organized, existing, and doing business under and by virtue of the laws of the State of Delaware, with its office and principal place of business located at 201 East Fourth Street, Cincinnati, Ohio 45202.

4. Proposed respondent admits all the jurisdictional facts set forth in the draft of compiaint here attached.

5. Proposed respondent waives:

(a) Any further procedural steps;

(b) The requirement that the Commission's decision contain a statement of findings of fact and conclusions of law;

(c) All rights to seek judicial review or otherwise to challenge or contest the validity of the order entered pursuant to this Agreement; and

(d) Any claim under the Equal Access to Justice Act.

6. This Agreement shall not become part of the public record of the proceedings unless and until it is accepted by the Commission. If this Agreement is accepted by the Commission it, together with the draft of complaint contemplated thereby, will be placed on the public record for a period of sixty (60) days and information in respect thereto publicly released. The Commission thereafter may either withdraw its acceptance of this Agreement and so notify the proposed respondent, in which event it will take such action as it may consider appropriate, or issue and serve its complaint (in such form as the circumstances may require) and decision, in disposition of the proceeding.

7. This Agreement is for settlement purposes only and does not constitute an admission by proposed respondent that the law has been violated as alleged in the draft of complaint here attached.

8. This Agreement contemplates that, if it is accepted by the Commission, and if such acceptance is not subsequently withdrawn by the Commission pursuant to the provisions of Section 2.34 of the Commission's Rules, the Commission may, without further notice to proposed respondent, (1) issue its complaint corresponding in form and substance with the draft of complaint here attached and its decision containing the following order to divest and cease and desist, and for other relief in disposition of the proceeding, and (2) make information public with respect thereto. When so entered, the order shall have the same force and effect and may be altered, modified, or set aside in the same manner and within the same time provided by statute for other orders. The order shall become final upon service. Delivery by the United States Postal Service of the complaint and decision containing the agreed-to order to proposed respondent's address as stated in this Agreement shall constitute service. Proposed respondent waives any right it may have to any other manner of service. The complaint may be used in construing the terms of the order, and no agreement, understanding, representation, or interpretation not contained in the Agreement or the order may be used to vary or contradict the terms of the order.

9. Proposed respondent has read the proposed complaint and order contemplated hereby. Johnson understands that once the order has been issued, it will be required to file one or more compliance reports showing it has fully complied with the order. Proposed respondent further understands that it may be liable for civil penalties in the amount provided by law for each violation of the order after it becomes final.

Order

I.

As used in this order, the following definitions shall apply:

A. "Johnson" means S.C. Johnson & Son, Inc., its predecessors, successors and assigns, divisions, subsidiaries, affiliates, companies, groups, partnerships and joint ventures that S.C. Johnson & Son, Inc. controls, directly or indirectly, and their directors, officers, employees, agents and representatives, and their respective successors and assigns.

B. "BMS" means Bristol-Myers Squibb Company, its predecessors, successors and assigns, divisions, subsidiaries, affiliates, companies, groups, partnerships and joint ventures that Bristol-Myers Squibb Company controls, directly or indirectly, and their directors, officers, employees, agents and representatives, and their respective successors and assigns.

C. "Drackett" means The Drackett Company, its predecessors, successors and assigns, divisions, subsidiaries, affiliates, companies, groups, partnerships and joint ventures that The Druckett Company controls, directly or indirectly, the their directors, officers, employees, agents and representatives, and their respective successors and assigns.

D. "Acquisition" means the acquisition by Johnson from BMS of all the voting securities of Drackett, a wholly-owned subsidiary of BMS, and certain assets of BMS relating to Drackett's international business.

E. "Air freshener products" means products designed to combat and eliminate offensive odors in the home that are applied by aerosol spray, or in liquid, solid, wick or other forms and that are distributed to consumers primarily through grocery, drug, and mass merchandise stores.

F. "Furniture care products" means household polishes and dusting aids designed to clean, shine, and protect furniture and other household surfaces, which are applied by aerosol spray or in cream, paste, liquid and other forms and that are distributed to consumers primarily through grocery, drug, and mass merchandise stores.

G. "Renuzit Assets" means all of Drackett's rights, title and interest in and to:

(1) Air freshener products, including, but not limited to, the brands and trademarks "Renuzit", "Renuzit Adjustable", "Renuzit Roommate", "Renuzit Freshell", "Renuzit Fragrance Jar", "Renuzit Aerosol", and "Renuzit Fresh 'n Dry";

(2) Furniture care products, including, but not limited to, the brands and trademarks "Endust" and "Behold", but excluding the brand and trademark "Jr. Muscle" outside the United States; and

(3) All of Drackett's assets and businesses associated with the development, production, distribution, and sale for resale of air freshener products and furniture care products and as further delineated in the subparagraphs of Schedule A, attached hereto and made a part hereof.

II.

It is ordered That:

A. Johnson shall divest, absolutely and in good faith, within twelve (12) months of the date this order becomes final, the Renuzit Assets; provided, however, Johnson is not required to divest any of the Renuzit Assets identified in Schedule A, Part 2, if such assets are not needed by the acquirer or acquirers ("acquirer(s)") in connection with the development, production, distribution, and sale for resale of air freshener products or furniture care products.

B. Johnson shall divest the Renuzit Assets only to an acquirer or acquirers ("acquirer(s)") that receive the prior approval of the Commission, and only in a manner that receives the prior approval of the Commission. The purpose of the divestiture of the Renuzit Assets is to ensure the continuation of the assets as an ongoing, viable enterprise engaged in the same businesses in which the Renuzit Assets

presently are employed, and to remedy the lessening of competition resulting from the proposed Acquisition as alleged in the Commission's complaint.

C. At the time of divestiture, Johnson shall make available to the acquirer(s) such Johnson personnel, assistance and training as the acquirer(s) might reasonably need to transfer Drackett technology and know-how included in the Renuzit Assets, and shall continue providing such personnel, assistance and training at Johnson's cost for a period of time (not to exceed six (6) months) sufficient to satisfy the acquirer(s)' management that its personnel are appropriately trained in the technology and know-how. At the time of divestiture, Johnson shall also divest any additional, incidental assets of Drackett and make any further arrangements for administrative services within the first six (6) months after divestiture that may be reasonably necessary to assure the viability and competitiveness of the Renuzit Assets.

D. Johnson shall ensure that substantially the same services that BMS agreed to provide Johnson pursuant to the Acquisition Agreement dated October 26, 1992, between Johnson and BMS covering Johnson's acquisition of Drackett ("Acquisition Agreement"), shall be provided to the acquirer(s), upon the acquirer's request and on the same terms as such services are provided to Johnson, during the period that BMS has agreed to provide Johnson such services pursuant to the Acquisition Agreement.

E. Johnson will provide and ensure that BMS also provides reasonable cooperation and assistance to the acquirer(s) in obtaining approvals for the transfer of all registrations, leases, licenses, certifications, permits, or similar documents relating to the Renuzit Assets.

F. Johnson shall comply with all terms of the Agreement to Hold Separate, attached hereto and made a part hereof. The Agreement to Hold Separate shall continue in effect until such time as Johnson has divested the Renuzit Assets or until such other time as the Agreement to Hold Separate provides.

G. Johnson shall take such actions as are necessary to maintain the viability and marketability of the Renuzit Assets and to prevent the destruction, removal, wasting, deterioration or impairment of any of the Renuzit Assets except in the ordinary course of business and except for ordinary wear and tear that does not affect the viability and marketability of the Renuzit Assets.

III.

It is further ordered That:

A. If Johnson has not divested, absolutely and in good faith and with the Commission's prior approval, the Renuzit Assets within twelve (12) months of the date this order becomes final, Johnson shall consent to the appointment by the Commission of a trustee to divest the Renuzit Assets. In the event the Commission or the Attorney General brings an action pursuant to section 5(1) of the Federal Trade Commission Act, 15 U.S.C. 45(1), or any other statute enforced by the Commission, Johnson shall consent to the appointment of a trustee in such action. Neither the appointment of a trustee nor a decision not to appoint a trustee under this Paragraph shall preclude the Commission or the Attorney General from seeking civil penalties or any other relief available to it, including a court-appointed trustee, pursuant to section 5(1) of the Federal Trade Commission Act, or any other statute enforced by the Commission, for any failure by Johnson to comply with this order.

B. If a trustee is appointed by the Commission or a court pursuant to Paragraph III.A. of this order, Johnson shall consent to the following terms and conditions regarding the trustee's power, duties, authorities, and responsibilities:

1. The Commission shall select the trustee, subject to the consent of Johnson, which consent shall not be unreasonably withheld. The trustee shall be a person with experience and expertise in acquisitions and divestitures.

2. The trustee shall, subject to the prior approval of the Commission, have the exclusive power and authority to divest the Renuzit Assets, and in addition, after a period of six (6) months, to divest the trademark "Vanish" along with the Renuzit Assets, together with any additional, incidental assets of Johnson, including those relating to the "Vanish" trademark, and make any further arrangements for administrative services that may be reasonably necessary to assure the viability and competitiveness of the Renuzit Assets and the "Vanish" trademark.

3. The trustee shall have twelve (12) months from the date the Commission approves the trust agreement described in Paragraph B.8. to accomplish the divestiture. If, however, at the end of the twelve-month period, the trustee has submitted a plan of divestiture or believes that divestiture can be accomplished within a reasonable time, the divestiture period may be extended by the Commission or by the court (in the case of a court-appointed trustee). Provided, however, the Commission may only extend the divestiture period two (2) times.

4. The trustee shall have full and complete access to the personnel, books, records, and facilities related to the Renuzit Assets, or any other relevant information, as the trustee may reasonably request. Johnson shall develop such financial or other information as such trustee may reasonably request and shall cooperate with any reasonable request of the trustee. Johnson shall take no action to interfere with or impede the trustee's accomplishment of the divestiture. Any delays in divestiture caused by Johnson shall extend the time for divestiture under this Paragraph in an amount equal to the delay, as determined by the Commission or the court for a court-appointed trustee.

5. Subject to Johnson's absolute and unconditional obligation to divest at no minimum price and the purpose of the divestiture as stated in Paragraph II.B. of this order, the trustee shall use his or her best efforts to negotiate the most favorable price and terms available with each acquirer for the divestiture. The divestiture shall be made in the manner set out in Paragraph II; provided, however, if the trustee receives bona fide offers from more than one acquirer, and if the Commission determines to approve more than one such acquirer, the trustee shall divest to the acquirer(s) selected by Johnson from among those approved by the Commission.

6. The trustee shall serve, without bond or other security, at the cost and expense of Johnson, on such reasonable and customary terms and conditions as the Commission or a court may set. The trustee shall have authority to employ, at the cost and expense of Johnson, such consultants, accountants, attorneys, investment bankers, business brokers, appraisers, and other representatives and assistants as are reasonably necessary to carry out the trustee's duties and responsibilities. The trustee shall account for all monies derived from the sale and all expenses incurred. After approval by the Commission and, in the case of a court-appointed trustee, by the court, of the account of the trustee, including fees for his or her services, all remaining monies shall be paid at the direction of Johnson and the trustee's power shall be terminated. The trustee's compensation shall be based at least in significant part on a commission arrangement contingent on the trustee's divesting the Renuzit Assets.

7. Johnson shall indemnify the trustee and hold the trustee harmless against any losses, claims, damages, liabilities, or expenses arising out of, or in connection with, the performance of the trusteeship, including all reasonable fees of counsel and other expenses incurred in connection with the preparation for, or defense of any claim, whether or not resulting in any liability, except to the extent that such liabilities, claims, or expenses result from misfeasance, negligence, willful or wanton acts, or bad faith by the trustee.

8. Within thirty (30) days after appointment of the trustee, and subject to the prior approval of the Commission and, in the case of a court-appointed trustee, of the court, Johnson shall execute a trust agreement that transfers to the trustee all rights and powers necessary to permit the trustee to effect the divestiture required by this order.

9. If the trustee ceases to act or fails to act diligently, a substitute trustee shall be appointed in the same manner as provided in Paragraph III.A. of this order.

10. The Commission or, in the case of a court-appointed trustee, the court, may on its own initiative or at the request of the trustee issue such additional orders or directions as may be necessary or appropriate to accomplish the divestiture required by this order.

11. The trustee shall have no obligation or authority to operate or maintain either the Renuzit Assets or those assets associated with the "Vanish" trademark.

12. The trustee shall report in writing to Johnson and to the Commission every thirty (30) days concerning the trustee's efforts to accomplish divestiture.

IV.

It is further ordered That Johnson shall maintain the viability and marketability of the "Vanish" trademark together with any additional, incidental assets of Johnson relating to the "Vanish" trademark, and shall not sell, transfer, encumber (other than in the normal course of business), or otherwise impair their marketability or viability, pending divestiture without the prior approval of the Commission.

V.

It is further ordered That, within sixty (60) days after the date this order becomes final and every sixty (60) days thereafter until Johnson has fully complied with the provisions of Paragraphs II and III of this order, Johnson shall submit to the Commission a verified written report setting forth in detail the manner and form in which it intends to comply, is complying, or has complied with those provisions. Johnson shall include in its compliance reports, among other things that are required from time to time, a full description of all substantive contacts or negotiations for the divestiture, including the identity of all parties contacted. Johnson also shall include in its compliance reports copies of all written communications to and from such parties, all internal memoranda, and all reports and recommendations concerning divestiture.

VI.

It is further ordered That, for a ten (10) year period commencing on the date this order becomes final, Johnson shall cease and desist from acquiring, without the prior approval of the Federal Trade Commission, directly or indirectly, through subsidiaries, partnerships or otherwise.

(1) Any equity or other interest in, or the whole or any part of the stock or share capital of, any person or business that is engaged in the development, production, distribution, and sale for resale of air freshener products or furniture care products in the United States; provided, however, that individual employees of Johnson and each pension, benefit or welfare plan or trust controlled by Johnson may acquire, for investment purposes only, an interest of not more than two (2) percent of the stock or share capital of such person or business;

(2) Any equity or other interest in, or the whole or any part of the stock or share capital of, any person or business that owns or licenses a brand or trademark used in connection with the sale of air freshener products or furniture care products in the United States; provided, however, that individual employees of Johnson and each pension, benefit or welfare plan or trust controlled by Johnson may acquire, for investment purposes only, an interest of not more than two (2) percent of the stock or share capital of such person or business; or

(3) Any assets used or previously used (and still suitable for use) in the manufacture or production of air freshener products or furniture care products; provided, however, that Johnson may, in the ordinary course of business, make purchases of used equipment suitable for manufacturing air freshener products and/or furniture care products totalling not more than $1 million per year.

One (1) year from the date this order becomes final and annually thereafter for nine (9) years on the anniversary date of this order, Johnson shall file with the Secretary of the Federal Trade Commission a verified written report of its compliance with this Paragraph.

VII.

It is further ordered That, for the purposes of determining or securing compliance with this order, and subject to any legally recognized privilege, upon written request and on reasonable notice to Johnson, Johnson shall permit any duly authorized representatives of the Commission:

A. Access, during office hours and in the presence of counsel, to inspect and copy all books, ledgers, accounts, correspondence, memoranda and other records and documents in the possession or under the control of Johnson relating to any matters contained in this consent order; and

B. Upon five (5) days notice to Johnson, and without restraint or interference from Johnson, to interview officers or employees of Johnson, who may have counsel present, regarding such matters.

VIII.

It is further ordered That Johnson shall notify the Commission at least thirty (30) days prior to any change that may affect compliance obligations arising out of the order, including but not limited to, any change in Johnson such as dissolution, assignment, or sale resulting in the emergency of a successor, the creation or dissolution of subsidiaries, or any other change.

Schedule A

Johnson shall divest all of the Renuzit Assets pursuant to the terms of this order. The associated assets identified in Paragraph I.G.(3) of this order shall include all assets, properties, business and goodwill, tangible and intangible, utilized by Drackett in the development, production, distribution and sale of air freshener products and furniture care products, including, without limitation, the following:

Part 1

(1) All customer lists, vendor lists, catalogs, sales promotion literature, advertising materials, marketing information, product development information, research materials, technical information, management information systems, software, inventions, trade secrets, technology, know-how, specifications, designs, drawings, processes and quality control data;

(2) Intellectual property rights, patents and patent applications and the

formulas, copyrights, trademarks and trade names, service marks:

(3) All rights, title and interest in and to the contracts entered in the ordinary course of business with customers (together with associated bid and performance bonds), suppliers, sales representatives, brokers and distributors, agents, inventors, product testing and laboratory research institutions, providers of electronic data exchange services, personal property lessors, personal property lessees, licensors, licensees, consignors and consignees;

(4) All rights under warranties and guarantees, express or implied;

(5) All books, records, files, financial statements and supporting documents;

(6) All items of prepaid expense.

Part 2

(1) The Franklin, Kentucky plant, all machinery, fixtures, equipment, vehicles, furniture, tools and all other tangible personal property;

(2) Inventory;

(3) Accounts and notes receivable;

(4) All Environmental Protection Agency and all other federal and state regulatory agency registrations and applications, and all documents related thereto; and

(5) All rights, title and interest in and to owned or leased real property, together with appurtenances, licenses and permits.

Analysis of Proposed Consent Order To Aid Public Comment

The Federal Trade Commission ("Commission") has accepted provisionally a proposed Consent Order and Agreement to Hold Separate from S.C. Johnson & Son, Inc. ("SCJ").

The proposed Consent Order has been placed on the public record for sixty (60) days for reception of comments by interested persons. Comments received during this period will become part of the public record. After sixty (60) days, the Commission will again review the agreement and the comments received and will decide whether it should withdraw from the agreement or make final the agreement's proposed order.

On October 26, 1992, SCJ entered into an agreement with Bristol-Myers Squibb Company ("BMS") to buy all of the voting securities of the Drackett Company ("Drackett"), a wholly-owned subsidiary of BMS, and certain assets of BMS relating to Drackett's international business. The proposed complaint alleges that the proposed acquisition, if consummated, would constitute a violation of section 7 of the Clayton Act, as amended, 15 U.S.C. 18 and section 5 of the FTC Act, as amended, 15 U.S.C. 45 in the markets for the manufacturer and sale of air freshener products and furniture care products in the United States.

The proposed Consent Order provides that SCJ shall divest all of the assets relating to Drackett's air freshener products and furniture care products businesses (the "Renuzit Assets") within twelve (12) months of the Order becoming final. If the divestiture is not completed within twelve (12) months, the Commission will appoint a trustee to complete the divestiture. If the Renuzit Assets are not divested by the trustee after an additional six (6) months, the proposed Order provides that all of the assets relating to Drackett's toilet bowl cleaning products the "Vanish Assets", shall also be divested with the Renuzit Assets.

The Hold Separate Agreement provides that pending divestiture, the Renuzit Assets shall be operated independently of SCJ. Under the provisions of the proposed Order, SCJ is also required to provide the Commission with a report of its compliance with the divestiture provisions of the Order within sixty (60) days following the date this Order becomes final, and every sixty (60) days thereafter until SCJ has completely divested the Renuzit Assets. The proposed Order will also require SCJ to cease and desist for ten (10) years from acquiring, without Federal Trade Commission approval, any interest in assets suitable for the manufacture, sale, or distribution of air freshener products or furniture care products in the United States. SCJ will also be required to file with the Commission annual reports of its compliance with the Order.

The purpose of this analysis is to facilitate public comment on the proposed Order, and it is not intended to constitute an official interpretation of the agreement and proposed Order or to modify in any way their terms.

Benjamin I. Berman,

Acting Secretary.

BILLING CODE 6750–01–M

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Food and Drug Administration

[Docket No. 92N–0448]

Boehringer Ingelheim Animal Health, Inc., Withdrawal of Approval of NADA

AGENCY: Food and Drug Administration, HHS.

ACTION: Notice.

SUMMARY: The Food and Drug Administration (FDA) is withdrawing approval of a new animal drug application (NADA) held by Boehringer Ingelheim Animal Health, Inc. The NADA provides for the use of True Antibiotic 10 Lactating Cow Mastitis Treatment (procaine penicillin G). The firm requested the withdrawal of approval. In a final rule published elsewhere in this issue of the **Federal Register**, FDA is amending the regulations by removing the entry that reflects the approval.

EFFECTIVE DATE: January 19, 1993.

FOR FURTHER INFORMATION CONTACT: Mohammad I. Sharar, Center for Veterinary Medicine (HFV–216), Food and Drug Administration, 7500 Standish Pl., Rockville, MD 20855, 301–295–8749.

SUPPLEMENTARY INFORMATION: Boehringer Ingelheim Animal Health, Inc., 2621 North Belt Highway, St. Joseph, MO 64506, is the sponsor of NADA 65–466 which provides for the use of True Antibiotic 10 Lactating Cow Mastitis Treatment. In its letter dated August 10, 1992, the sponsor requested the withdrawal of approval of the NADA.

Therefore, under authority delegated to the Commissioner of Food and Drugs (21 CFR 5.10) and redelegated to the Center for Veterinary Medicine (21 CFR 5.84), and in accordance with § 514.115 *Withdrawal of approval of applications* (21 CFR 514.115), notice is given that approval of NADA 65–466 and all supplements and amendments thereto is hereby withdrawn, effective January 19, 1993.

In a final rule published elsewhere in this issue of the **Federal Register**, FDA is amending 21 CFR 526.1696a(f) to reflect the withdrawal of approval of this NADA.

Dated: December 16, 1992.

Gerald B. Guest,

Director, Center for Veterinary Medicine.

BILLING CODE 4160–01–F

[Docket Nos. 91N–0429 and 91P–0325]

Alpha Therapeutic Corp.; Revocation of U.S. License No. 744–071

AGENCY: Food and Drug Administration, HHS.

ACTION: Notice.

SUMMARY: The Food and Drug Administration (FDA) is announcing the revocation of the establishment license (U.S. License No. 744–071) and the product license issued to Alpha

Therapeutic Corp. (doing business as Alpha Plasma Center) for the manufacture of Source Plasma. Alpha Therapeutic Corp. has multiple Centers at various locations under its licenses. Only the Alpha Plasma Center in Odessa, TX, is affected by this revocation. A notice of opportunity for a hearing (NOOH) on a proposal to revoke the licenses was published in the Federal Register of January 21, 1992 (57 FR 2281). On February 14, 1992, Alpha Therapeutic Corp. requested a hearing. On March 20, 1992, Alpha Therapeutic Corp. withdrew its request for a hearing. On March 20, 1992, Alpha Therapeutic Corp. also withdrew a petition (Docket No. 91P–0325) requesting reconsideration of FDA's decision to institute proceedings for the revocation of U.S. License No. 744–071.

DATES: The revocation of the above establishment and product license is effective on January 6, 1993.

FOR FURTHER INFORMATION CONTACT: JoAnn M. Minor, Center for Biologics Evaluation and Research (HFB–132), Food and Drug Administration, 8800 Rockville Pike, Bethesda, MD 20892, 301–295–8188.

SUPPLEMENTARY INFORMATION: FDA is revoking the establishment license (U.S. License No. 744–071) and the product license issued to Alpha Therapeutic Corp., doing business as Alpha Plasma Center, located at 2100 Andrews Hwy., Odessa, TX 79761, for the manufacture of Source Plasma. Other locations under the Alpha Therapeutic Corp. license are not affected by this revocation.

By letter dated April 26, 1991, FDA advised Alpha Therapeutic Corp. that FDA intended to initiate proceedings to revoke the licenses. In the Federal Register of January 21, 1992 (57 FR 2281), FDA published a NOOH on the proposed revocation of the licenses pursuant to 21 CFR 12.21(b), as provided in 21 CFR 601.5(b). As described in the NOOH, the grounds for the proposed license revocation included the following: (1) The results of the most recent FDA inspections of Alpha Plasma Center in February 1991, (2) the results of an FDA investigation of Alpha Plasma Center conducted concurrently with the February 1991 inspections, (3) a determination by FDA that the deviations documented during the February 1991 inspections and investigation of Alpha Plasma Center showed significant and continued noncompliance with the applicable Federal regulations and the provisions of the establishment's license, and (4) a determination by FDA that the violations at the Alpha Plasma Center were significant and willful. FDA noted that documentation in support of the proposed revocations had been placed on file for public examination with Dockets Management Branch (HFA–305), Food and Drug Administration, rm. 1–23, 12420 Parklawn Dr., Rockville, MD 20857.

The NOOH provided 30 days for Alpha Therapeutic Corp. to submit any written request for a hearing, as specified in 21 CFR 12.21(b), and 60 days to submit any written data justifying a hearing. The NOOH further provided 60 days for other interested persons to submit written comments on the proposed revocations. FDA advised Alpha Therapeutic Corp., by telephone, that the NOOH had been published, and forwarded a copy of the NOOH to Alpha Therapeutic Corp., by facsimile transmission, on February 3, 1992.

Alpha Therapeutic Corp. responded to the NOOH by letter dated February 14, 1992. The letter requested a hearing concerning the proposal to revoke the establishment and the product licenses issued for the Alpha Plasma Center location. The letter also stated that data justifying a hearing would be submitted by March 23, 1992. By letter dated March 20, 1992, the firm informed FDA that after further consideration, and in light of the financial impact, Alpha Therapeutics Corp. was withdrawing its request for a hearing. By a separate letter dated March 20, 1992, Alpha Therapeutic Corp. also withdrew a petition (Docket No. 91N–0325) that requested reconsideration of FDA's decision to institute proceedings for the revocation of U.S. License No. 744–071.

No other written comments on the proposed revocations were received within the prescribed 60 days specified in the NOOH. Accordingly, under 21 CFR 12.38(a)(1), 601.7, 601.8, and the Public Health Service Act (sec. 351 (42 U.S.C. 262)), and under authority delegated to the Commissioner of Food and Drugs (21 CFR 5.10) and redelegated to the Director and Deputy Director, Center for Biologics Evaluation and Research (21 CFR 5.67(d)), the establishment license (U.S. License No. 744–071) and the product license issued to Alpha Therapeutic Corp. for the manufacture of Source Plasma are revoked, effective January 6, 1993.

Dated: December 15, 1992.

Kathryn C. Zoon,

Director, Center for Biologics Evaluation and Research.

BILLING CODE 4160–01–F

[Docket No. 92N–0501]

Lyphomed, et al.; Withdrawal of Approval of 30 Abbreviated New Drug Applications

AGENCY: Food and Drug Administration, HHS.

ACTION: Notice.

SUMMARY: The Food and Drug Administration (FDA) is withdrawing approval of 30 abbreviated new drug applications (ANDA's). The holders of the ANDA's notified the agency in writing that the drug products were no longer marketed and requested that the approval of the applications be withdrawn.

EFFECTIVE DATE: February 5, 1993.

FOR FURTHER INFORMATION CONTACT: Lola E. Batson, Center for Drug Evaluation and Research (HFD–360), Food and Drug Administration, 7500 Standish Pl., Rockville, MD 20855, 301–295–8038.

SUPPLEMENTARY INFORMATION: The holders of the ANDA's listed in the table in this document have informed FDA that these drug products are no longer marketed and have requested that FDA withdraw approval of the applications. The applicants have also, by their request, waived their opportunity for a hearing.

ANDA No.	Drug	Applicant
/0–522	Aminocaproic Acid Injection, USP, 250 milligrams (mg)/milliliters (mL)	Lyphomed, 2045 North Cornell Ave., Melrose Park, IL 60160–1002.

89–415	Procainamide Hydrochloride Injection, USP, 100 mg/mL	Do.
89–416	Procainamide Hydrochloride Injection, USP, 500 mg/mL	Do.

Therefore, under section 505(e) of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 355(e)), and under authority delegated to the Director, Center for Drug Evaluation and Research (21 CFR 5.82), approval of the ANDA's listed above, and all amendments and supplements thereto, is hereby withdrawn, effective February 5, 1993.

Dated: December 16, 1992.

Carl C. Peck,

Director, Center for Drug Evaluation and Research.

BILLING CODE 4160–01–F

[Docket No. 91E–0491]

Determination of Regulatory Review Period for Purposes of Patent Extension; Pravachol®; Correction

AGENCY: Food and Drug Administration, HHS.

ACTION: Notice; correction.

SUMMARY: The Food and Drug Administration (FDA) is correcting the notice of its determination of the regulatory review period for purposes of patent term extension for Pravachol® (pravastatin sodium) that appeared in the **Federal Register** of March 10, 1992 (57 FR 8461). The notice incorrectly identified the applicant for patent term extension as "E. R. Squibb & Sons, Inc." The notice should have identified the applicant as "Sankyo Co., Ltd." In addition, the notice incorrectly stated: "[T]he applicable regulatory review period for Pravachol® is 2,189 days. Of this time, 1,040 days occurred during the testing phase of the regulatory review period, while 1,149 days occurred during the approval phase." The notice should have stated: "[T]he applicable regulatory review period for Pravachol® is 2,191 days. Of this time, 1,187 days occurred during the testing phase of the regulatory review period, while 1,004 days occurred during the approval phase." A correction to the March 10, 1992, notice was published in the **Federal Register** of April 24, 1992 (57 FR 15090); the latter notice contained errors and should be disregarded.

FOR FURTHER INFORMATION CONTACT: John S. Ensign, Office of Health Affairs (HFY–20), Food and Drug Administration, 5600 Fishers Lane, Rockville, MD 20857, 301–443–1382.

1. In FR Doc. 92–5596, appearing on page 8461 in the **Federal Register** of Tuesday, March 10, 1992, the following corrections are made:

On page 8462, in the first column, under the caption "SUPPLEMENTARY INFORMATION:", in the third complete paragraph, in line 14, "E. R. Squibb & Sons, Inc." is corrected to read "Sankyo Co., Ltd."; on the same page, in the second column, in the first complete paragraph, in line 3, "2,189" is corrected to read "2,191"; in line 4, "1,040" is corrected to read "1,187"; and in line 6, "1,149" is corrected to read "1,004".

Dated: December 17, 1992.

Stuart L. Nightingale,

Associate Commissioner for Health Affairs.

[FR Doc. 93–97 Filed 1–5–93; 8:45 am]

BILLING CODE 4160–01–F

Advisory Committee; Notice of Meeting

AGENCY: Food and Drug Administration, HHS.

ACTION: Notice.

SUMMARY: This notice announces a forthcoming meeting of a public advisory committee of the Food and Drug Administration (FDA). This notice also summarizes the procedures for the meeting and methods by which interested persons may participate in open public hearings before FDA's advisory committees.

MEETING: The following advisory committee meeting is announced:

Vaccines and Related Biological Products Advisory Committee

Date, time, and place. January 26, 1993, 8:30 a.m., Conference rms. D and E, Parklawn Bldg., 5600 Fishers Lane, Rockville, MD.

Type of meeting and contact person. Open public hearing, 8:30 a.m. to 9:30 a.m., unless public participation does not last that long; open committee discussion, 9:30 a.m. to 5 p.m.; Jack Gertzog, Center for Biologics Evaluation and Research (HFB–5), Food and Drug Administration, 5600 Fishers Lane, Rockville, MD 20857, 301–295–8226.

General function of the committee. The committee reviews and evaluates data on the safety and effectiveness of vaccines intended for use in the diagnosis, prevention, or treatment of human diseases.

Agenda—Open public hearing. Interested persons may present data, information, or views, orally or in writing, on issues pending before the committee. Those desiring to make formal presentations should notify the contact person before January 20, 1993, and submit a brief statement of the general nature of the evidence or arguments they wish to present, the names and addresses of proposed

participants, and an indication of the approximate time required to make their comments.

Open committee discussion. The committee will discuss: (1) The influenza virus vaccine formulation for the 1993 through 1994 influenza season, (2) a live oral cholera vaccine (Swiss Serum and Vaccine Institute), and (3) the reorganization of the Center for Biologics Evaluation and Research.

FDA public advisory committee meetings may have as many as four separable portions: (1) An open public hearing, (2) an open committee discussion, (3) a closed presentation of data, and (4) a closed committee deliberation. Every advisory committee meeting shall have an open public hearing portion. Whether or not it also includes any of the other three portions will depend upon the specific meeting involved. There are no closed portions for the meetings announced in this notice. The dates and times reserved for the open portions of each committee meeting are listed above.

The open public hearing portion of each meeting shall be at least 1 hour long unless public participation does not last that long. It is emphasized, however, that the 1 hour time limit for an open public hearing represents a minimum rather than a maximum time for public participation, and an open public hearing may last for whatever longer period the committee chairperson determines will facilitate the committee's work.

Public hearings are subject to FDA's guideline (subpart C of 21 CFR part 10) concerning the policy and procedures for electronic media coverage of FDA's public administrative proceedings, including hearings before public advisory committees under 21 CFR part 14. Under 21 CFR 10.205, representatives of the electronic media may be permitted, subject to certain limitations, to videotape, film, or otherwise record FDA's public administrative proceedings, including presentations by participants.

Meetings of advisory committees shall be conducted, insofar as is practical, in accordance with the agenda published in this **Federal Register** notice. Changes in the agenda will be announced at the beginning of the open portion of a meeting.

Any interested person who wishes to be assured of the right to make an oral presentation at the open public hearing portion of a meeting shall inform the contact person listed above, either orally or in writing, prior to the meeting. Any person attending the hearing who does not in advance of the meeting request an opportunity to speak will be allowed to make an oral presentation at the hearing's conclusion, if time permits, at the chairperson's discretion.

The agenda, the questions to be addressed by the committee, and a current list of committee members will be available at the meeting location on the day of the meeting.

Transcripts of the open portion of the meeting will be available from the Freedom of Information Office (HFI–35), Food and Drug Administration, rm. 12A–16, 5600 Fishers Lane, Rockville, MD 20857, approximately 15 working days after the meeting, at a cost of 10 cents per page. The transcript may be viewed at the Dockets Management Branch (HFA–305), Food and Drug Administration, rm. 1–23, 12420 Parklawn Dr., Rockville, MD 20857, approximately 15 working days after the meeting, between the hours of 9 a.m. and 4 p.m., Monday through Friday. Summary minutes of the open portion of the meeting will be available from the Freedom of Information Office (address above) beginning approximately 90 days after the meeting.

This notice is issued under section 10(a)(1) and (2) of the Federal Advisory Committee Act (5 U.S.C. app. 2), and FDA's regulations (21 CFR part 14) on advisory committees.

Dated: December 21, 1992.

Jane E. Henney,

Deputy Commissioner for Operations.

[FR Doc. 93–98 Filed 1–5–93; 8:45 am]

BILLING CODE 4160–01–F

Indian Health Service

National Environmental Policy Act; Categorical Exclusions

AGENCY: Indian Health Service (IHS), HHS.

ACTION: List of IHS program actions that are categorically excluded from the requirement to conduct further evaluation under the National Environmental Policy Act (NEPA).

SUMMARY: This notice provides a list of classes of IHS actions that normally do not have a significant impact on the environment and, therefore, do not require environmental impact statements (EIS) or environmental assessments (EA) under Council on Environmental Quality (CEQ) regulations (40 CFR parts 1500–1508) or Department of Health and Human Services (HHS) procedures (HHS General Administration Manual Part 30). All actions involving construction are reviewed to determine if extraordinary or exceptional circumstances exist that prevent the action from meeting the criteria established for this listing.

EFFECTIVE DATE: January 6, 1993.

FOR FURTHER INFORMATION CONTACT: Director, Division of Environmental Health (DEH), Office of Environmental Health and Engineering (OEHE), IHS, Public Health Service (PHS), HHS, room 5A–39, Parklawn Building, 5600 Fishers Lane, Rockville, Maryland 20857; or telephone (301) 443–1043.

SUPPLEMENTARY INFORMATION: Regulations of the CEQ at 40 CFR parts 1500–1508 require Federal agencies to adopt procedures to supplement and implement their regulations. The HHS, by giving notice in the **Federal Register** (45 FR 76519), has adopted such procedures and included them in the HHS General Administration Manual Part 30. The CEQ approved the HHS procedures on October 2, 1980. Paragraphs 1507.3 and 1508.4 of the CEQ regulations provide for the definition of categories of actions that do not individually or cumulatively have a significant effect on the human environment and therefore, do not require the preparation of an EIS or an EA. Paragraph 30–20–40 of the HHS General Administration Manual establishes categories of exclusion for Departmental actions and provides for the listing of actions by Operating Divisions within the Department. The IHS, as an agency of the PHS, hereby gives notice of its listing of actions which normally can be categorically excluded from further environmental review.

If a proposed action belongs to an excluded category but one or more extraordinary or exceptional circumstances (as defined in Part K) apply, then an EA must be prepared for the purpose of determining whether an EIS is warranted.

The IHS provides comprehensive health care services to more than 1 million American Indians and Alaska Natives. The goal of the IHS program is to raise the health status of American Indians and Alaska Natives to the highest level possible. In carrying out this goal, the program has three main objectives: (1) To deliver the highest quality health services possible; (2) to assist tribes and native corporations to develop their capacity to manage health programs; and (3) to serve as an advocate for American Indians and Alaska Natives in health related matters.

The IHS program is carried out through a health services delivery system, designed to provide a broad mix of preventive, curative, rehabilitative, and environmental services. The type of health services delivery system

employed varies from Area to Area. Population, health indices, and facilities and services available from sources other than the IHS are evaluated to determine the methods IHS uses to provide services.

The IHS program consists of two major systems: (1) A Federal health care delivery system, administered by Federal employees, and (2) a tribal health delivery system, administered by tribes and tribal groups under grants, contracts or cooperative agreements. The categorical exclusions apply to IHS program actions whether carried out directly by the IHS, or funded or otherwise sponsored by the IHS. The IHS contracts, grants, and cooperative agreements are actions defined in NEPA and are subject to the IHS review procedures established to ensure NEPA compliance, including provisions covering extraordinary and exceptional circumstances. The NEPA compliance for the tribal health care delivery system is ensured through IHS administrative procedures for contracts, grants, and cooperative agreements.

The selection of IHS program actions to list as categorical exclusions has been determined, in part, by agency experience in complying with NEPA, during the past 10 years. Actions required to provide health care services will not have significant impact on the environment except when exceptional or extraordinary circumstances exist. The IHS has categorically excluded these actions, since enactment of NEPA; however, actions involving construction normally have required completion of an environmental review/assessment.

The IHS administers programs for the construction of domestic sanitation facilities (water, wastewater, and solid waste) for Indian homes and communities, construction of new or replacement health care facilities and staff quarters, and renovations to existing health care facilities and quarters units.

Environmental reviews/assessments of construction projects undertaken during the past 10 years have concluded that an EIS was not required for any of them. Approximately 2,300 sanitation facilities construction projects and fewer than 60 health care facilities/staff quarters construction projects have been approved during this time.

The type of program and procedures employed to administer the construction of sanitation facilities for Indian homes and communities, and the consistent determinations that these projects do not have a significant impact on the environment, are the basis for the decision to list most sanitation facilities projects are categorically excluded.

Factors considered in making this determination include:

1. Projects are undertaken to improve health and/or environment.

2. Projects are untaken at the request and with approval of the tribal governing body, which provides for discussion and evaluation of the project and its impacts.

3. Projects are normally constructed on tribally owned or individually owned tribal land within reservation boundaries.

4. Projects are constructed to comply with all current applicable environmental regulations and plans and specifications are submitted to State and Federal agencies as necessary for review and comment.

5. Projects are constructed to provide utilities (water, sewer, solid waste) either for existing American Indian or Alaska Native homes or for new homes constructed with Federal, tribal, State or other resources. New homes are constructed at sites and locations approved by the Tribal Governing Board. Utilities are not provided for future development or undeveloped parcels, and capacity provided is limited to that routinely provided by standard engineering practice for the current design population.

6. The IHS projects fall into the category of minor construction projects based on cost. During the last 10 years, 85 of the 2,300 projects exceeded $1 million, and the average estimated cost was $250,000.

7. Standard IHS procedures require documentation of an environmental review of each construction project to identify any exceptional or extraordinary circumstances and to ensure compliance with all environmental laws, regulations, and executive orders; e.g., those concerning floodplains, wetlands, endangered species, etc. This review is required early in the project planning process.

The categorical exclusion for construction of health care facilities and staff quarters has been limited to renovation or new construction at existing health care delivery sites, and construction or development of relatively small facilities at new locations. The procedures noted in item 7 above for sanitation facilities construction projects also apply to all health care facility and staff quarters construction projects. Most health care facility and staff quarters renovation projects can be classified as minor construction projects based on cost. Fewer than 200 major renovation projects have been undertaken and only a few were funded at a level exceeding $1 million.

Categorical Exclusions

A. Health Services

Direct delivery of medical, dental, nursing, and other related health services; e.g., patient care/counseling administered from hospitals, health centers, health stations, satellite clinics, and in private homes by IHS staff or contract providers to authorized recipients.

B. Research

Research activities that are consistent with the mission of IHS including: (a) Biological and behavioral studies conducted in laboratories, clinics, and the field; (b) studies on the development and delivery of prevention and treatment services and their administration and financing; and (c) evaluations of prevention and treatment.

C. Pesticides

Application of pesticides which are not classified for restricted use under provisions of the Federal Insecticide, Fungicide and Rodenticide Act when used for routine pest control purposes.

D. Contracts, Grants, and Cooperative Agreements

Contracts, grants, and cooperative agreements and continuations, supplements, extensions, and amendments of these documents for IHS programs or actions that are categorically excluded. (Includes Self-Determination Act contracts, Contract Health Care contracts, etc.)

E. Technical Assistance

Action involving the provision of technical assistance to American Indian and Alaska Native tribes and groups, other Federal agencies, State and local governments, and non-profit organizations are excluded. These actions include but are not limited to:

1. The provision of technical assistance to American Indian and Alaska Native tribes and groups for the purpose of developing management capabilities needed to enable eventual tribal assumption of health program operation;

2. The provision of technical assistance to American Indian and Alaska Native tribes and groups for the purpose of developing capabilities in the areas of epidemiology, disease reduction, injury prevention, environmental improvement, and the operation and maintenance of sanitation facilities; and

3. The assignment of IHS personnel to agencies/organizations for the purpose of providing technical expertise (e.g.,

investigation, diagnosis, consultation, counseling) in health programs.

F. Management and Administrative Support

Routine management and administrative support actions.

G. Training, Education, and Manpower Development

The award of training grants, scholarships, and the provision of other types of training and educational assistance are excluded. These actions include:

1. Support for development of professional and paraprofessional health competencies;
2. Support for development of American Indian and Alaskan Natives health management capabilities;
3. Support for development of tribal and community capabilities in the areas of environmental improvement, disease reduction, injury control, and operation and maintenance of sanitation facilities;
4. Support for training and education of IHS personnel necessary for the efficient accomplishment of the IHS program; and
5. Educational activities including development of disease prevention and treatment and presentation of such material to American Indian and Alaskan Natives.

H. Statistics, Data Processing, and Information Gathering

Actions associated with statistics and information collection and dissemination are excluded. These actions typically involve:

1. Collection of demographic or morbidity data and analysis for program management and budget justification purposes;
2. Epidemiologic studies;
3. Environmental surveillance activities (e.g., sample collection, analysis, and monitoring of air, food, water, and wastewater) to determine quality as a basis for ensuring necessary corrective action;
4. Engineering studies and investigations including soil boring and test well drilling to gather data for the purpose of determining engineering feasibility and to permit facility design;
5. Updating existing data bases and data processing;
6. Printing and distributing reports; and
7. Developing new/redesignating existing data systems to meet specific program needs.

I. Indian Health Service Owned and Leased Facilities

Actions related to the IHS owned and leased facilities, or actions funded by IHS at tribally owned (or leased) and managed facilities as listed below, are excluded:

1. Maintenance and day-to-day operation of the physical plant and repairs to plant and equipment, or replacement-in-kind of utilities and building components;
2. Acquisition of equipment, provided all requirements for permits, registrations, and licenses are met, and provided the equipment involves use of generally accepted technology;
3. Building alteration or renovation that does not substantially change the function or general appearance of existing buildings;
4. Construction or lease of new facilities (including portable facilities and trailers) where such lease or construction:

(a) Is at the site of an existing health care facility and the facility capacity is not substantially increased,

(b) Is for buildings of less than 12,000 square feet of useable space when less than five acres of surface land area are involved at a new site, or

(c) Is for projects other than buildings when less than five acres of surface land area are involved at a new site;

5. Facility planning and design including funding of such activities;
6. Acquisition of space by lease, use agreement, transfer, gift or similar arrangement for which:

(a) The intended use of the space is consistent with the functional design of the building, and

(b) The acquisition is consistent with an applicable master plan, if such plan exists;

7. The acquisition, sale, release, abandonment, closure or transfer of real property, provided the action:

(a) Is consistent with any applicable master plan, if such a plan exists,

(b) Conforms to local zoning and land use ordinances, if such ordinances exist,

(c) Is consistent with the functional design of the facility,

(d) Would not violate applicable Federal, State, or local environmental protection or historic preservation laws, and

(e) Satisfies the requirements of applicable comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) section 120 (h) provisions.

J. Construction of Sanitation Facilities

Actions associated with construction of sanitation facilities to serve Indian homes and communities, except that the following actions are not excluded:

(1) Construction of a sanitary landfill at a new solid waste disposal site, and

(2) Construction of a new wastewater treatment facility with direct discharge of treated sewage to surface waters.

K. Extraordinary or Exceptional Circumstances

Under extraordinary circumstances, the normally excluded actions described above may have a significant environmental effect; such actions are not categorically excluded. Actions that can be characterized by, or may cause any of, the conditions described below are examples of actions that are not categorically excluded:

1. Those with potential to change the existing environment where such change violates directives or other controls that are imposed by any governmental body having jurisdiction, for the purpose of protecting or otherwise affecting that environment;
2. Those with potential or real threat of violation, or continued violation, of an applicable Federal, State, or local law or requirement imposed for protection of the environment or to ensure public health and safety;
3. Those likely to cause controversy with respect to the types or extent of the resulting environmental effects where such controversy is based on pertinent and substantial issues;
4. Those involving the use of technology where the possible effects are highly uncertain or involve unique or unknown risks and where such technology has not been assessed previously for environmental impact;
5. Those which have adverse effects on unique geographic characteristics (e.g., historic, archeological, or cultural resources, park recreation or refuge lands, wilderness areas, wild or scenic rivers, sole or principal drinking water aquifers, prime farmlands, wetlands, floodplains, coastal management zones or ecological or critical areas including those listed on the Department of Interiors National Register of National Landmarks);
6. Those which establish a precedent for future action or represent a decision in principle about future actions with potentially significant environmental effects;
7. Those which have adverse effects on properties listed or eligible for listing on the National Register of Historic Places;
8. Those which have adverse effects on species listed by the Federal Government as endangered or Threatened Species, or which have adverse effects on any designated critical habitat for these species;
9. Those which require assessment in accordance with Executive Order 11988 (Floodplain Management), or Executive

Order 11990 (Protection of Wetlands), or the Fish and Wildlife Coordination Act; and

10. Those which involve the use, transfer, or lease of real property which has been determined, after investigation in accordance with the provisions of CERCLA 120 (h), to have been used as a storage facility for hazardous waste for more than 1 year; and

11. Construction projects which are significantly greater in scope or size than normally experienced for a particular category of action.

Dated: December 29, 1992.

BILLING CODE 4160–16–M

National Institutes of Health

John E. Fogarty International Center for Advanced Study in the Health Sciences; Meeting of the Fogarty International Center Advisory Board

Pursuant to Public Law 92–463, notice is hereby given of the twenty-third meeting of the Fogarty International Center (FIC) Advisory Board, February 9, 1993, in the Lawton Chiles International House (Building 16), at the National Institutes of Health.

The meeting will be open to the public from 8:30 a.m. to 2:30 p.m. The morning agenda will include a report by the Director, FIC; a report of the meeting of the NIH Director's Advisory Committee; and a status report on FIC's long-range planning.

The afternoon agenda will be a report on a minority scientists international training initiative and a report on emerging infections.

In accordance with the provisions of sections 552b(c)(4) and 552b(c)(6), title 5, U.S.C. and section 10(d) of Public Law 92–463, the meeting will be closed to the public from 2:30 p.m. to adjournment for the review of applications for International Research Fellowships, Senior International Fellowships, Fogarty International Research Collaboration Awards, AIDS International Research Training Program, nominations for Scholars-in-Residence award, and proposals for Scholars Conferences.

Myra Halem, Committee Management Assistant, Fogarty International Center, Building 31, room B2C08, National Institutes of Health, Bethesda, Maryland 20892 (301–496–1491), will provide a summary of the meeting and a roster of the committee members upon request.

Dr. Coralie Farlee, Assistant Director for International Legislation and Advisory Activities, Fogarty International Center (Executive Secretary), Building 31, Room B2C08, telephone 301–496–1491, will provide substantive program information.

Catalog of Federal Domestic Assistance Program No. 93.154, Special International Postdoctoral Research Program in Acquired Immunodeficiency Syndrome and No. 93.989, Senior International Awards program.

Dated: December 23, 1992.

Susan K. Feldman,

Committee Management Officer, NIH.

BILLING CODE 4140–01–M

Notice of Meeting of the National Advisory Council for Human Genome Research

Pursuant to Public Law 92–463, notice is hereby given of the meeting of the National Advisory Council for Human Genome Research, National Center for Human Genome Research, January 24 and 25, 1993, in Chevy Chase I & II, Embassy Suites Hotel, Chevy Chase Pavilion, 4300 Military Road, NW., Wisconsin at Western Avenue, Washington, DC.

This meeting will be open to the public on January 25, 1993, from 8:30 a.m. to 10 a.m. to discuss administrative details or other issues relating to committee activities. Attendance by the public will be limited to space available.

In accordance with the provisions set forth in sections 552b(c)(4) and 552b(c)(6), title 5, U.S.C. and section 10(d) of Public Law 92–463, the meeting will be closed to the public on January 24 from 7 p.m. to recess and on January 25, 1993, from 10 a.m. to adjournment, for the review, discussion and evaluation of individual grant applications. The applications and the discussions could reveal confidential trade secrets or commercial property such as patentable material, and personal information concerning individuals associated with applications, the disclosure of which would constitute a clearly unwarranted invasion of personal privacy.

Dr. Elke Jordan, Deputy Director, National Center for Human Genome Research, National Institutes of Health, Building 38A, room 605, Bethesda, Maryland 20892, (301) 496–0844, will furnish the meeting agenda, rosters of Committee members and consultants, and substantive program information upon request.

BILLING CODE 4140–01–M

National Center for Nursing Research; Meeting: National Advisory Council for Nursing Research and its Subcommittees

Pursuant to Public Law 92–463, notice is hereby given of the meetings of the National Advisory Council for Nursing Research, National Center for Nursing Research; and its Subcommittees, February 1–3, 1993, Building 31C, Conference Room 6, National Institutes of Health, Bethesda, Maryland 20892.

Meetings of the full Council and its Subcommittees will be held at times and places listed below. Attendance by the public will be limited to space available.

The full Council will meet in open session on February 2, from 8:30 a.m. to 4 p.m. and on February 3, from approximately 11 a.m. to adjournment. Agenda items will include the NCNR Director's Report, Molecular Biology Task Force and Interface for the Biological Studies Plan with NIH Strategic Plan, National Nursing Research Agenda Phase II Priorities, and Report on the Division of Extramural Programs.

The Planning Subcommittee will meet in open session February 1, in Building 31B, NCNR Conference Room (5B–03), from 12 noon to 2:30 p.m. to discuss long-term and strategic planning and policy issues.

The Nursing Resources and Health Policy Subcommittee will meet in open session February 1, in Building 31C, Conference Room 6, from 12 noon to 2 p.m. to discuss nursing resources and health policy as they relate to nursing science and the achievement of quality and effective outcomes in patient care.

The Communications Subcommittee will meet in open session February 1, in Building 31C, Conference Room 6, from 2:30 p.m. to 4:30 p.m. to discuss goals and strategies for enhancing communications with specific audiences.

The National Nursing Research Agenda Subcommittee will meet in open session February 1, in Building 31B, NCNR Conference Room (5B–03), from 9 a.m. to 11:30 a.m. to discuss the National Nursing Research Agenda in general and the Priority Expert Panels in particular.

In accordance with the provisions set forth in sections 552b(c)(4) and 552b(c)(6), title 5, U.S. Code and section 10(d)) of Public Law 92–463, the meeting of the Research Subcommittee will be closed to the public on February 1, from 2:30 p.m. to 4:30 p.m., and the meeting of the full Council on February 3, from 8:30 a.m. to approximately 11 a.m. for the review, discussion, and evaluation of individual grant applications. The applications and the discussions could reveal confidential trade secrets or commercial property such as patentable material, and personal information concerning individuals associated with the applications, the disclosure of which would constitute a clearly unwarranted invasion of personal privacy.

Dr. Ethel Jackson, Executive Secretary, National Advisory Council for Nursing Research, National Institutes of Health, Building 31, room 5B25, Bethesda, Maryland 20892, (301) 496–0472, will provide a summary of the meeting, roster of committee members, and substantive program information upon request.

(Catalog of Federal Domestic Assistance Program No. 93.361, Nursing Research, National Institutes of Health.)

Dated: December 23, 1992.

Susan K. Feldman,

Committee Management Officer, NIH.

BILLING CODE 4140–01–M

National Eye Institute; Meeting of the National Advisory Eye Council

Pursuant to Public Law 92–463, notice is hereby given of the meeting of the National Advisory Eye Council (NAEC) on February 4 and 5, 1993, in Building 31C, Conference Room 6, National Institutes of Health, Bethesda, Maryland.

The NAEC meeting will be open to the public from 8:30 a.m. until approximately 11:30 a.m. on Thursday, February 4, 1993. Following opening remarks by the Director, NEI, there will be presentations by the staff of the Institute and discussions concerning Institute programs and policies. Attendance by the public at the open sessions will be limited to space available.

In accordance with provisions set forth in sections 552b(c)(4) and 552b(c)(6), title 5, U.S.C. and section 10(d) of Public Law 92–463, the meeting of the NAEC will be closed to the public from approximately 11:30 a.m. on Thursday, February 4 until adjournment on Friday, February 5 for the review, discussion, and evaluation of individual grant applications. These applications and the discussions could reveal confidential trade secrets or commercial property such as patentable material, and personal information concerning individuals associated with the applications, the disclosure of which would constitute a clearly unwarranted invasion of personal privacy.

Ms. Lois DeNinno, Committee Management Officer, National Eye Institute, Building 31, room 6A04, National Institutes of Health, Bethesda, Maryland 20892, (301) 496–9110, will provide a summary of the meeting, roster of committee members, and substantive program information upon request.

BILLING CODE 4140–01–M

National Institute of Neurological Disorders and Stroke; Meeting

Pursuant to Public Law 92–463, notice is hereby given of meetings of committees of the National Institute of Neurological Disorders and Stroke (NINDS). These meetings will be open to the public to discuss program planning, program accomplishments and special reports or other issues relating to committee business as indicated in the notice.

The Council meeting will be open to the public on February 4, 1993, as listed below. The agenda includes a report by the Director, NINDS, and a report by the Director, Division of Intramural Research, NINDS. Attendance by the public will be limited to space available.

These meetings will be closed to the public as indicated below in accordance with the provisions set forth in sections 552b(c)(4) and 552b(c)(6), title 5, U.S.C. and sections 10(d) of Public Law 92–463, for the review, discussion and evaluation of individual grant applications. These applications and discussions could reveal confidential trade secrets or commercial property such as patentable material, and personal information concerning individuals associated with the applications, the disclosure of which would constitute a clearly unwarranted invasion of personal privacy.

Summaries of meetings, rosters of committee members, and other information pertaining to the meetings can be obtained from the Executive Secretary or the Scientific Review Administrator indicated.

Name of Committee: The Planning Subcommittee of the National Advisory Neurological Disorders and Stroke Council.

Date: February 3, 1993.

Place: National Institutes of Health, Building 31, Conference Room 8A28, 9000 Rockville Pike, Bethesda, MD 20892.

Open: 1 p.m.–3 p.m.
Closed: 3 p.m.–recess.

Name of Committee: National Advisory Neurological Disorders and Stroke Council.

Dates: February 4–5, 1993.

Place: National Institutes of Health, Shannon Building—Wilson Hall, Bethesda, MD 20892.

Open: February 4, 9 a.m.–1 p.m.

Closed: February 4, 1 p.m.–recess, February 5, 8:30 a.m.–adjournment.

Executive Secretary: Constance W. Atwell, Ph.D. Special Assistant for Extramural Activities, NINDS, National Institutes of Health Bethesda, MD 20892, Telephone: (301) 496–9248.

Name of Committee. Neurological Disorders Program Project Review A Committee.

Dates: February 13–15, 1993.

Place: Pier 66 Resort and Marina, 2301 S.E. 17th Causeway, Fort Lauderdale, FL 33316.

Open: February 13, 7:30 p.m.–8 p.m.

Closed. February 13, 8 p.m.–recess, February 14, 8:30 a.m.–recess, February 15, 8:30 a.m–adjournment.

Scientific Review Administrator: Dr. Katherine Woodbury, Federal Building, room 9C–14, National Institutes of Health, Bethesda, MD 20892, Telephone: (301) 496–9223.

Name of Committee: Training Grant and Career Development Review Committee.

Dates: February 22–23, 1993.

Place: Holiday Inn Chevy Chase, 5520 Wisconsin Avenue, Chevy Chase, MD 20815.

Open: February 22, 8:30 a.m.–9 a.m.

Closed. February 22, 9 a.m.–recess, February 23, 8 a.m.–adjournment.

Scientific Review Administrator: Dr. Herbert Yellin, Federal Building, room 9C–10, National Institutes of Health, Bethesda, MD 20892, Telephone: (301) 496–9223.

Name of Committee: Neurological Disorders Program Project Review B Committee.

Dates. February 25–27, 1993.

Place: Holiday Inn Bethesda, 8120 Wisconsin Avenue, Bethesda, MD 20814.

Open February 25, 7 p.m.–7:30 p.m.

Closed: February 25, 7:30 p.m.–recess, February 26, 8:30 a.m.–recess, February 27, 8:30 a.m.–adjournment.

Scientific Review Administrator: Dr. Paul Sheehy, Federal Building, room 9C–14, National Institutes of Health, Bethesda, MD 20892, Telephone: (301) 496–9223.

(Catalog of Federal Domestic Assistance Program No. 93.853, Clinical Research Related to Neurological Disorders; No. 93.854, Biological Basis Research in the Neurosciences).

Dated: December 23, 1992.

BILLING CODE 4140–01–M

National Institute on Deafness and Other Communication Disorders; Meetings of the National Deafness and Other Communication Disorders Advisory Council and its Research Subcommittee

Pursuant to Public Law 92–463, notice is hereby given of the meetings of the National Deafness and Other Communication Disorders Advisory Council and its Training Subcommittee and Research Subcommittee on January 27–29, 1993, at the National Institutes of Health, 9000 Rockville Pike, Bethesda, Maryland. The meeting of the full Council will be held in Conference Room 6, Building 31C, and those of the subcommittees in Conference Room 7, Building 31C.

The meeting of the Training Subcommittee will be open to the public on January 27 from 12:30 pm to adjournment at approximately 2:30 pm. The meeting of the Research Subcommittee will be open to the public on January 27 from 2:30 pm until 3:30 pm for the discussion of policy issues. The meeting of the full Council will be open to the public on January 28 from 8:30 am until recess for a report from the Institute Director and discussion of extramural policies and procedures at the National Institutes of Health and the National Institute on Deafness and Other Communication Disorders and on January 29 from 8:30 am to approximately 9 a.m. for a report on extramural programs of the Division of Communication Sciences and Disorders.

In accordance with the provisions set forth in section 552b(c)(4) and 552b(c)(6), title 5, U.S.C. and section 10(d) of Public Law 92–463, the meeting of the Research Subcommittee on January 27 will be closed to the public from 3:30 p.m. to adjournment. The meeting of the full Council will be closed to the public on January 29 from 9 a.m. until adjournment. The closed portions of the meetings will be for the review, discussion, and evaluation of individual grant applications. The applications and the discussions could reveal confidential trade secrets or commercial property such as patentable material, and personal information concerning individuals associated with the applications, the disclosure of which would constitute a clearly unwarranted invasion of personal privacy.

Further information concerning the Council and Subcommittee meetings may be obtained from Dr. John C. Dalton, Executive Secretary, National Deafness and Other Communication Disorders Advisory Council, National Institute on Deafness and Other Communication Disorders, Executive Plaza South, room 400B, National Institutes of Health, Bethesda, Maryland 20892, 301–496–8693. A summary of the meetings and rosters of the members may also be obtained from his office.

BILLING CODE 4140–01–M

National Library of Medicine; Meetings of the Board of Regents and Subcommittees

Pursuant to Public Law 92–463, notice is hereby given of the meeting of the Board of Regents of the National Library of Medicine on February 11–12, 1993, in the Board Room of the National Library of Medicine, 8600 Rockville Pike, Bethesda, Maryland. The Subcommittee will meet on February 10 as follows:

The Extramural Programs Subcommittee, 5th-floor Conference Room, Building 38A, 2 to approximately 3:30 p.m., and the Planning Subcommittee in Conference Room B, Building 38, 4 to approximately 5 p.m. The Extramural Programs Subcommittee will be closed to the public.

The meeting of the Board will be open to the public from 3 to approximately 4 p.m. on February 11 and from 9 a.m. to adjournment on February 12 for administrative reports and program discussions. Attendance will be limited to space available.

In accordance with provisions set forth in sections 552b(c)(4), 552b(c)(6), title 5, U.S.C. and section 10(d) of Public Law 92–463, the entire meeting of the Extramural Programs Subcommittee on February 10 will be closed to the public, and the regular Board meeting on February 11 will be closed from approximately 4 to adjournment for the review, discussion, and evaluation of individual grant applications. These applications and the discussion could reveal confidential trade secrets or commercial property, such as patentable material, and personal information concerning individuals associated with the applications, the disclosure of which would constitute a clearly unwarranted invasion of personal privacy.

Mr. Robert B. Mehnert, Chief, Office of Inquiries and Publications Management, National Library of

Medicine, 8600 Rockville Pike, Bethesda, Maryland 20894, Telephone Number: 301–496–6308, will furnish a summary of the meeting, rosters of Board members, and other information pertaining to the meeting.

(Catalog of Federal Domestic Assistance Program No. 93.879—Medical Library Assistance, National Institutes of Health.)

Dated: December 23, 1992.

BILLING CODE 4140–01–M

Prospective Grant of Exclusive Patent License

AGENCY: National Institutes of Health, Public Health Service, DHHS.

ACTION: Notice.

SUMMARY: This is notice in accordance with 15 U.S.C. 209(c)(1) and 37 CFR 404.7(a)(1)(i) that the National Institutes of Health (NIH), Department of Health and Human Services, is contemplating the grant of an exclusive license in a limited field of use to practice the inventions embodies in U.S. Patent Application 07/010,424 (now U.S. Patent Application 07/445,131), entitled "Vector for Recombinant Poxvirus Expressing Rabies Virus Glycoprotein," and U.S. Patent Application 07/198,213 (now U.S. Patent Application 07/829,597), entitled "Raccoon Poxvirus As a Gene Expression and Vaccine Vector for Genes of Rabies and Other Organisms" to Fort Dodge Laboratories Inc. having a place of business at Fort Dodge, Iowa. The patent rights in these inventions have been assigned to the United States of America.

The prospective exclusive license will be for the field of veterinary biologicals. It will be royalty-bearing and will comply with the terms and conditions of 35 U.S.C. 209 and 37 CFR 404.7. The prospective exclusive license may be granted unless, within sixty days from the date of this published Notice, NIH receives written evidence and argument that establishes that the grant of the license would not be consistent with the requirements of 35 U.S.C. 209 and 37 CFR 404.7.

These inventions relate to a novel plasmid containing a recombinant infectious vaccinia poxvirus for use in the production of rabies vaccine and production of rabies virus glycoprotein antigen, antibody, and related reagents. The inventions also relate to a recombinant vector containing raccoon poxvirus as a method for inducing protective immunity against rabies virus and other organisms.

The availability of U.S. Patent Application 07/010,424, for licensing was published in the April 30, 1987 edition of the **Federal Register**. The availability of U.S. Patent Application 07/198,213 for licensing was published in the June 28, 1988 edition of the **Federal Register**. Requests for a copy of the above identified patent applications, inquiries, comments and other materials relating to the contemplated license should be directed to: Mr. Mark Hankins, J.D., Office of Technology Transfer, National Institutes of Health, Box OTT, Bethesda, Maryland 20892 (telephone: (301) 496–7735; FAX: (301) 402–0220). Properly filed competing applications for a license filed in response to this notice will be treated as objections to the grant of the contemplated license. Only written comments and/or applications for a license which are received by the NIH Office of Technology Transfer within sixty (60) days of this notice will be considered.

Dated: December 23, 1992.

Reid G. Adler,

Director, Office of Technology Transfer

Public Health Service

Treasury, Postal Service and General Government Appropriations Act of 1992; Delegation of Authority

Notice is hereby given that in furtherance of the delegation of authority of November 19, 1992, by the Secretary of Health and Human Services to the Assistant Secretary for Health, I have delegated to Director, Centers for Disease Control and Prevention, with authority to redelegate, all the authorities vested in the Assistant Secretary for Health under section 633 of the Treasury, Postal Service and General Government Act of 1992, Public Law 102–141, as amended hereafter. This delegation excludes the authority to promulgate regulations and to submit reports to Congress.

This delegation became effective upon date of signature. In addition, I have affirmed and ratified any actions taken by the Director, Centers for Disease Control and Prevention or his subordinates which, in effect, involved the exercise of the authorities delegated herein prior to the effective date of the delegation.

Dated: December 22, 1992.

James O. Mason,

Assistant Secretary for Health.

BILLING CODE 4160–16–M

DEPARTMENT OF THE INTERIOR

Bureau of Indian Affairs

Education Facilities Construction Priority List as of FY 1993

December 31, 1992.

AGENCY: Bureau of Indian Affairs, Interior.

ACTION: Notice.

SUMMARY: The Bureau of Indian Affairs (BIA) is publishing an Education Facilities Construction Policy List as of FY 1993. Publication of the Priority List in the **Federal Register** is required by statute. The Priority List includes those projects that were on the New School Construction Priority List for FY 1992 along with additions that have been made to the list. This Priority List is being published "as of FY 1993." Construction funding is not currently available for all of the Education Facilities Construction projects listed on the Priority List. As appropriations become available, Education Facilities Construction projects will be funded for construction in the order in which they are ranked.

FOR FURTHER INFORMATION CONTACT: W. "Buck" Martin, Director, Office of Construction Management, Department of the Interior, Mail Stop 2417 MIB, 1849 C Street, NW., Washington, DC 20240, telephone number (202) 208–3403.

SUPPLEMENTARY INFORMATION: The BIA is publishing the Priority List of Education Facilities Construction projects to satisfy 25 U.S.C. 2005(c) that provides: "At the time any budget request for school construction is presented, the Secretary shall publish in the **Federal Register** and submit with the budget request the current list of all school construction priorities."

The current priority ranking process is in accordance with the "Construction of School Facilities for Indian Children; School Construction Applications and Procedures" that were published in the **Federal Register** on May 22, 1979, at 44 FR 29864. Amended criteria to be used in the priority ranking of new school construction projects were published in the **Federal Register** on April 14, 1988, at 53 FR 12470.

On October 19, 1990, at 55 FR 42497, a notice was published that contained the "New School Construction Priority

List for FY 1992." The notice established a deadline of December 15, 1990, for filing applications to be considered for the FY 1993 priority ranking list.

The Conference Report for the Fiscal Year 1992 Interior and Related Agencies Appropriation Act, House Report No. 256, 102d Cong., 1st Sess., p. 46 (1991) (Conference Report) froze the "New School Construction Priority List for FY 1992." Under the current procedures, the priority list published each year has been a proposed list and subject to the availability of appropriated funds. Not all projects listed received construction funding. Those projects not funded had to file a new or updated application the next year to be considered for priority ranking. Applications were evaluated and a new list was prepared each year.

Congress provided funding for planning and design "for the top ten schools contained on the fiscal year [1992] priority list, to the extent that funds are available." Schools not funded for planning and design in FY 1992 would be funded for planning and design in FY 1993.

"[S]tarting at the top of the fiscal year 1992 list and including Pyramid Lake," construction funding was to be made available after completion of the necessary validations, planning and design. It was recognized by Congress that appropriations for FY 1992 were insufficient to provide construction funding for the ten schools listed on the New School construction Priority List of FY 1992 plus Pyramid Lake. The Conference Report stated that additional funds would be provided to complete these projects in FY 1993 and outyears.

The Conference Report further directed the Department "to review applications and prepare a new school construction priority list for fiscal year 1993, with these schools eligible for planning and design and construction funding, subject to budget constraints in fiscal year 1993 and beyond, in addition to any remaining fiscal year 1992 schools."

The Department published a notice in the Federal Register on December 6, 1991, at 56 FR 64185, that new applications and/or additional, supplemental materials in support of existing new school applications on file could be submitted for consideration for priority ranking in FY 1993. The notice established a deadline of January 31, 1992, for filing new or updated applications.

The applications submitted for inclusion on the FY 1993 list have been evaluated and priority ranked. Five (5) schools have been selected for inclusion on the new school priority list for FY 1993. Because Congress has created a continuous multi-year priority ranking list for new school construction, it is misleading to refer to the list as the priority list for FY 1993. Although some planning and design funding is available, construction funding has not been appropriated. Construction funding will not become available until funding has been provided for all the ten (10) schools on the New School Construction Priority List for FY 1992 plus the Congressional add-on, Pyramid Lake.

To prevent any confusion or misunderstanding, the Department is consolidating the FY 1992 and FY 1993 new school construction priority lists into one continuous multi-year list. For reference purposes, the list set out below is entitled: "Education Facilities Construction Priority List as of FY 1993." The list contains: The ten (10) new schools which were included on the "New School Construction Priority List for FY 1992," Nos. 1 through 10; plus Pyramid Lake, which was added by Congress, No. 11; and, the five (5) schools priority ranked for FY 1993, Nos. 12 through 16.

The priority ranking process under current procedures has been subject to criticism, primarily because of the uncertainty of the process, by Indian tribes and Indian organizations, as well as Congress. A decision had been made by the Department, prior to the FY 1992 Interior Appropriations Act, to promulgate regulations to govern the priority ranking process.

The Conference Report acknowledged the actions and directed the Department to continue efforts to revise the priority ranking process for new school construction. The Conference Report stated that emphasis should be given to tribal consultation and to improving the objectivity of the ranking process, to providing continuity to the priority ranking list and to providing procedures for handling emergency needs.

Tribal consultation meetings were held on a draft of a proposed rulemaking document in December 1991 and a proposed rule adding a new Part 294 Education Facilities Construction to title 25 of the Code of Federal Regulations should be published in the Federal Register in the near future.

Because of the current efforts to promulgate regulations and the action by Congress to create a continuous multi-year priority list, the Department does not intend to call for the filing of applications for new school construction under the current process, again. However, once the regulations are published as a final rule and are in effect, the Department will provide for the filing of applications.

As the regulations are currently drafted, not only will a notice be published in the Federal Register, but also mailed directly to all federally-recognized tribes and BIA-funded schools, whether BIA-operated, contract, or grant. The notice will advise individuals of the relevant procedures to be followed as well as the deadline for filing applications. Publication of a final rule is not anticipated until the end of 1993. Schools listed on the "Education Facilities Construction Priority List of FY 1993" will not have to reapply, but will be retained, in order, on the list. School construction projects priority ranked under the regulations will be added at the end of any schools remaining from the Education Facilities Construction Priority List as of FY 1993.

The "Education Facilities Construction Priority List as of FY 1993" is as follows:

Education Facilities Construction Priority List as of FY 1993

1. Pinon Community School Dorm
2. Eastern Cheyenne River Consolidated School
3. Rock Point Community School
4. Many Farms High School
5. Tucker Day School
6. Shoshone-Bannock/Fort Hall School
7. Standing Pine Day School
8. Chief Leschi School Complex
9. Seba Delkai Boarding School
10. Sac and Fox Settlement School
11. Pyramid Lake
12. Shiprock Alternative School
13. Tuba City Boarding School
14. Fond du Lac Ojibway School
15. Second Mesa Day School
16. Zia Day School

Eddie F. Brown,

Assistant Secretary—Indian Affairs.

BILLING CODE 4310–02–M

National Park Service

Completion of Inventory of Native American Human Remains From Hawaii in the Possession of the Peabody & Essex Museum

AGENCY: National Park Service, Interior.

ACTION: Notice.

Notice is hereby given in accordance with provisions of the Native American Graves Protection and Repartriation Act, 25 U.S.C. 3003(d), of the completion of the inventory of human remains from Hawaii in the possession of the Peabody & Essex Museum. Representatives of

culturally affiliated Native Hawaiian organizations are advised that these human remains will be retained by the museum until February 5, 1993, after which they may be repatriated to the culturally affiliated group.

The detailed inventory and assessment of these human remains has been made by the Peabody & Essex Museum curatorial staff, specialists in physical anthropology and prehistoric archeology from the Bernice Pauahi Bishop Museum, Honolulu, HI, and representatives of Hui Mālama I Nā Kūpuna 'O Hawai'i Nei, a nonprofit, Native Hawaiian organization incorporated under the laws of the State of Hawaii and recognized under 25 U.S.C. 3001 (6) to provide guidance and expertise in decisions dealing with Native Hawaiian cultural issues, particularly burial issues.

The human remains consist of a cranium collected by Charles Derby in the Sandwich (now Hawaiian) Islands in the 19th Century. The cranium was accessioned by the Essex Institute prior to 1867 and catalogued as Hawaiian. Osteological documentation revealed a "rocker jaw" and upper palate typical of Polynesian individuals. The crania is believed to be of Hawaiian cultural affiliation based on this morphology and collection history.

Based on the above mentioned information, officials of the Peabody & Essex Museum have determined pursuant to 25 U.S.C. 3001 (2) that there is a relationship of shared group identity which can be reasonably traced between these remains and present-day Native Hawaiian organizations.

This notice has been sent to officials of Hui Mālama I Nā Kūpuna 'O Hawai'i Nei and the Office of Hawaiian Affairs. Representatives of any other Native Hawaiian organization which believes itself to be culturally affiliated with these human remains should contact John R. Grimes, Curator of Archeology, Peabody & Essex Museum, East India Square, Salem MA 01970, (508) 745–1876, before February 5, 1993.

Dated: December 31, 1992.

Francis P. McManamon,

Departmental Consulting Archeologist Chief, Archeological Assistance Division.

[FR Doc 93–139 Filed 1–5–93: 8:45 am]

BILLING CODE 4310–70–M

INTERSTATE COMMERCE COMMISSION

[Ex Parte No. 514 (A)]

Privacy Act: Establishment of a System of Records; Office of Inspector General Complaint and Investigative Files

AGENCY: Interstate Commerce Commission.

ACTION: Notice of proposed new system of records and request for comments.

SUMMARY: The Commission (ICC) is establishing a new system of records under the Privacy Act of 1974, as amended (5 U.S.C. 552a), Pub. L. 93–579, to consist of the complaint and investigatory file of the ICC's Office of Inspector General (OIG). The new system of records facilitates the OIG's ability to collect, maintain, use and disclose information pertaining to individuals, thus helping to ensure that the OIG may efficiently and effectively perform its investigations and other authorized duties and activities.

DATES: Comments are due February 5, 1993.

ADDRESSES: An original and two copies of comments referring to Ex Parte No. 514 (A) should be submitted to: Office of the Secretary, Case Control Branch, room 1324, Interstate Commerce Commission, Washington, DC 20423.

FOR FURTHER INFORMATION CONTACT: S. Arnold Smith, Freedom of Information/Privacy Officer (202) 927–6317. [TDD for hearing impaired: (202) 927–5721.

SUPPLEMENTARY INFORMATION: As required by 5 U.S.C. 552a(e)(4), the ICC is notifying the public of the establishment of a new system of records in its OIG (32–20–0015). This system is being established as part of the formal creation of an OIG within the ICC under the authority of the 1988 amendments to the Inspector General Act of 1978. See Pub. L. No. 100–504, 102 Stat.251 (amending 5 U.S.C. App. 3 1978)). Among the OIG's statutory duties are the prevention and detection of fraud, waste, and abuse relating to the ICC's programs and operations through the conduct of audits and investigations and the preparation of reports to the ICC's Chairman and to Congress.

The system of records being established consists of complaint and investigatory files compiled and maintained by the OIG. Due to the law enforcement nature of these records, the proposed system may be exempted by the ICC from certain provisions of the Privacy Act including disclosure to individuals who are the subject of a record in the system. See 5 U.S.C. 552a(j)(2) and (k)(2). The exemption of the system is the subject of a companion notice of proposed rulemaking to amend ICC Rule 49 CFR 1007.12. That notice is published in the proposed rule section of today's **Federal Register**. Pursuant to 5 U.S.C. 552a(o) and OMB Circular No. A–130, the ICC has submitted its report on the proposed establishment of this system of records to both Houses of Congress and to OMB.

Unless changes are made in response to comments received from the public, this action will become effective 30 days after final publication of the proposed amendment to ICC Rule 49 CFR 1007.12. The effective date may be extended if the Director of the Office of Management and Budget (OMB) declines, in whole or in part, the ICC's request to waive the 60 day period prescribed by OMB for advance notice to it and Congress. See OMB Circular No. A–130, App.1 at section 4b.(c)(4).

Accordingly, the ICC proposes to establish the following system of records.

32–20–0015

SYSTEM NAME:

OIG Complaint and Investigative Files.

SYSTEM LOCATION:

OIG, ICC. Room 2121, Washington, DC 20423.

CATEGORIES OF INDIVIDUALS COVERED BY THE SYSTEM:

Individuals involved in complaints reported to and investigations conducted by the OIG relating to the programs and operations of the ICC.

CATEGORIES OF RECORDS IN THE SYSTEM:

Files containing information relevant to complaints and investigations. Files include all relevant correspondence, internal staff memoranda, copies of all subpoenas issued, affidavits, witness statements, transcripts of testimony and accompanying exhibits, working papers of the staff, and any other reports, documents, and records. These records are used as a basis for the issuance of subpoenas, suitability determinations, and civil, criminal, and administrative actions.

AUTHORITY FOR MAINTENANCE OF THE SYSTEM:

The authority for maintenance of the system is found under the Inspector General Act Amendments of 1988, Public Law 100–504, 102 Stat. 251 (amending 5 U.S.C. App. 3 (1978)).

ROUTINE USES OF RECORDS MAINTAINED IN THE SYSTEM, INCLUDING CATEGORIES OF USERS AND THE PURPOSES OF SUCH USES:

In addition to the disclosures generally permitted under 5 U.S.C. 552a(b), these records or information in these records may specifically be disclosed pursuant to 5 U.S.C. 552a(b)(3) as follows, provided that no routine use specified herein shall be construed to limit or waive any other routine use specified herein:

(1) To other agencies, offices, establishments, and authorities, whether federal, state, local, foreign, or self-regulatory (including, but not limited to, organizations such as professional associations or licensing boards), authorized or with the responsibility to investigate, litigate, prosecute, enforce, or implement a statute, rule, regulation, or order, where the record or information, by itself or in connection with other records or information:

(a) Indicates a violation or potential violation of law, whether criminal, civil, administrative, or regulatory in nature, and whether arising by general statute or particular program statute, or by regulation, rule, or order issued pursuant thereto, or

(b) Indicates a violation or potential violation of a professional, licensing, or similar regulation, rule or order, or otherwise reflects on the qualifications or fitness of an individual who is licensed or seeking to be licensed;

(2) To any source, private or governmental, to the extent necessary to secure from such source information relevant to and sought in furtherance of a legitimate investigation or audit;

(3) To agencies, offices, or establishments of the executive, legislative, or judicial branches of the federal or state government:

(a) Where such agency, office, or establishment has an interest in the individual for employment purposes, including a security clearance or determination as to access to classified information, and needs to evaluate the individual's qualifications, suitability, or loyalty to the United States Government, or

(b) Where an agency, office, or establishment conducts an investigation of the individual for purposes of granting a security clearance, or making a determination of qualifications, suitability, or loyalty to the United States Government or access to classified information or restricted areas, or

(c) Where the records or information in those records are relevant and necessary to a decision with regard to the hiring or retention of an employee or disciplinary or other administrative action concerning the employee, or

(d) Where disclosure is requested in connection with the award of a contract or other determination relating to a government procurement, or the issuance of a license, grant, or other benefit by the requesting agency, to the extent that the record is relevant and necessary to the requesting agency's decision on the matter, including but not limited to, disclosure to any Federal agency responsible for considering suspension or debarment action where such record would be germane to a determination of the propriety or necessity of such action, or disclosure to the United States General Accounting Office, the General Services Administration Board of Contract Appeals, or any other Federal contract board of appeals in cases relating to an agency procurement;

(4) To the Office of Personnel Management, the Office of Government Ethics, the Merit Systems Protection Board, the Office of Special Counsel, the Equal Employment Opportunity Commission, or the Federal Labor Relations Authority or its General Counsel, of records or portions thereof relevant and necessary to carry out their authorized functions, such as, but not limited to, rendering advice requested by the OIG, investigations of alleged or prohibited personnel practices (including unfair labor or discriminatory practices), appeals before official agencies, offices, panels or boards, and authorized studies or reviews of civil service or merit systems or affirmative action programs;

(5) To independent auditors or other private firms with which the OIG has contracted to carry out an independent audit or investigation, or to analyze, collate, aggregate or otherwise refine data collected in the system of records, subject to the requirement that such contractors shall maintain Privacy Act safeguards with respect to such records;

(6) To any authorized component of the ICC, the Department of Justice, or other law enforcement authority, and for disclosure by such parties:

(a) To the extent relevant and necessary in connection with litigation in proceedings before a court or other adjudicative body, where (i) the United States is a party to or has an interest in the litigation, including where the ICC, or an ICC component, or an ICC official or employee in his or her official capacity, or an individual ICC official or employee whom the Department of Justice has agreed to represent, is or may likely become a party, and (ii) the ligation is likely to affect the agency or any component thereof, or

(b) For purposes of obtaining advice, including advice concerning the accessibility of a record or information under the Privacy Act or the Freedom of Information Act;

(7) To the National Archives and Record Administration for records management inspections conducted under authority of 44 U.S.C. 2904 and 2096;

(8) To a Congressional office from the record of a subject individual in response to an inquiry from the Congressional office made at the request of the individual, but only to the extent that the record would be legally accessible to that individual;

(9) To any direct recipient of federal funds, such as a contractor, where such record reflects serious inadequacies with a recipient's personnel and disclosure of the record is for purpose of permitting a recipient to take corrective action beneficial to the Government;

(10) To debt collection contractors for the purposes of collecting debts owed to the Government, as authorized under the Debt Collection Act of 1982, 31 U.S.C. 3718, and subject to applicable Privacy Act safeguards;

(11) To a grand jury pursuant either to a federal or state grand jury subpoena, or to a prosecution request that such record be released for the purposes of its introduction to a grand jury where subpoena or request has been specifically approved by a court;

(12) To OMB for the purposes of obtaining advice regarding ICC obligations under the Privacy Act; or

(13) To the Secretary of the ICC for purpose of placing any ex parte communication, which has not already been reported to the Secretary pursuant to 49 CFR 1102.2(e), in the correspondence section of the appropriate public docket.

POLICIES AND PRACTICES FOR STORING, RETRIEVING, ACCESSING, RETAINING, AND DISPOSING OF RECORDS IN THE SYSTEM:

STORAGE:

The OIG files consist of paper records maintained in binders or folders, and on automated data storage devices. Files are secured at all times.

RETRIEVABILITY:

Indexed on disk by case number. Paper records are filed numerically by case number. At this time, records are not cross-indexed by name and/or by subject but are expected to be retrieved in this fashion in the near future.

ACCESS CONTROL:

Access to the records is limited to authorized staff in OIG and to other

authorized officials or employees of ICC on a need-to-know basis as determined by the OIG. All records are kept in limited access areas during duty hours and in locked files at all other times.

RETENTION AND DISPOSAL:

To be retained for an unlimited period of time.

SYSTEM MANAGER AND ADDRESS:

Inspector General, OIG, ICC, room 2121, Washington, DC 20423.

NOTIFICATION PROCEDURE:

See 49 CFR Part 1007.

RECORD ACCESS PROCEDURE:

Same as above.

CONTESTING RECORD PROCEDURE:

Same as above.

RECORD SOURCE CATEGORIES:

Information in these records is obtained from all individuals and entities who may assist OIG in evaluating complaints and conducting investigations authorized by Pub. L. 100–504.

SYSTEMS EXEMPTED FROM CERTAIN PROVISIONS OF THE ACT:

This system is exempted from 5 U.S.C. 552a, except subsections (b), (c)(1) and (2), (e)(4)(A) through (F), (e)(6), (7), (9), (10), and (11) and (i), under 552a(j)(2) to the extent the system of records pertains to the enforcement of criminal laws; and is exempted from 5 U.S.C. 552a(c)(3), (d), (e)(1), (e)(4)(G), (H), (I), and (f) under 5 U.S.C. 552a(k)(2), to the extent the system of records consists of investigatory materials compiled for law enforcement purposes, other than that material within the scope of the exemption at 5 U.S.C. 552a(j)(2).

5 U.S.C. App. 3 (1978) prohibits disclosure by the OIG of the identity of any employee, without the consent of the employee, who submits a complaint or provides information concerning the possible existence of an activity constituting a violation of law, rules or regulations, or mismanagement, gross waste of funds, abuse of authority, or a substantial and specific danger to the public health or safety.

Decided: December 21, 1992.

By the Commission, S. Arnold Smith, Freedom of Information/Privacy Officer.

Sidney L. Strickland, Jr.,

Secretary.

BILLING CODE 7035–01–M

[Finance Docket No. 32189]

The Broe Cos., Inc.; Continuance in Control Exemption; Central Kansas Railway, Inc.

AGENCY: Interstate Commerce Commission.

ACTION: Notice of exemption.

SUMMARY: The Commission, under 49 U.S.C. 10505, exempts The Broe Companies, Inc. from the regulatory requirements of 49 U.S.C. 11343, *et seq.*, for its continuance in control of Central Kansas Railway, Inc. (CKR) once CKR becomes a rail carrier.[1]

DATES: This exemption is effective on December 31, 1992. Petitions to reopen must be filed by January 26, 1993.

ADDRESSES: Send pleadings referring to Finance Docket No. 32189 to: (1) Office of the Secretary, Case Control Branch, Interstate Commerce Commission, Washington, DC 20423.

(2) Petitioners' representatives: Louis E. Gitomer, Suite 210, 919 18th Street, NW., Washington, DC 20006.

FOR FURTHER INFORMATION CONTACT: Richard B. Felder, (202) 927–5610.

[TDD for hearing impaired: (202) 927–5721].

SUPPLEMENTARY INFORMATION: Additional information is contained in the Commission's decision. To purchase a copy of the full decision, write to, call, or pick up in person from: Dynamic Concepts, Inc., room 2229, Interstate Commerce Commission Building, Washington, DC 20423. Telephone: (202) 289–4357/4359. [Assistance for the hearing impaired is available through TDD services (202) 927–5721].

Decided: December 23, 1992.

By the Commission, Chairman Philbin, Vice Chairman McDonald, Commissioners Simmons and Phillips.

BILLING CODE 7035–01–M

[Docket No. AB–3 (Sub-No. 104X]

Missouri Pacific Railroad Co., Abandonment Exemption; in Muskogee, McIntosh and Haskell Counties, OK

AGENCY: Interstate Commerce Commission.

ACTION: Notice of exemption.

SUMMARY: The Commission exempts from the prior approval requirements of 49 U.S.C. 10903–10904 the Abandonment by Missouri Pacific Railroad Company of 43.0 miles of its Midland Valley Branch between Shopton and Kerr McGee, OK, subject to standard labor protective conditions, environmental and historic preservation conditions, and a public use condition. In addition, interim trail use has been approved.

DATES: Provided no formal expression of intent to file an offer of financial assistance has been received, this exemption will be effective on February 5, 1993. Formal expressions of intent to file an offer [1] of financial assistance under 49 CFR 1152.27(c)(2) must be filed by January 16, 1993; petitions to stay must be filed by January 19, 1993; and petitions to reopen must be filed by February 1, 1993.

ADDRESSES: Send pleadings referring to Docket No. AB–3 (Sub-No. 104X) to:

(1) Office of the Secretary, Case Control Branch, Interstate Commerce Commission, Washington, DC 20423, and

(2) Petitioner's representatives: Joseph D. Anthofer, Jeanna L. Regier, 1416 Dodge Street, #830, Omaha, NE 68179.

FOR FURTHER INFORMATION CONTACT: Richard B. Felder (202) 927–5610, [TDD for hearing impaired: (202) 927–5721].

BILLING CODE 7035–01–M

[Docket No. AB–12 (Sub-No. 148X]

Southern Pacific Transportation Company—Abandonment Exemption—In Tyler, Jasper, and Angelina Counties, TX

Southern Pacific Transportation Company (SP) has filed a notice of exemption under 49 CFR part 1152

[1] CKR is acquiring approximately 890 miles of railroad from The Atchison, Topeka and Santa Fe Railway Company. See Finance Docket No. 32190, Central Kansas Railway, Inc.—Acquisition and Operation Exemption—Certain Lines of The Atchison, Topeka and Santa Fe Railway Company (notice of exemption filed December 10, 1992).

[1] *See Exempt. of Rail Abandonment—Offers of Finan. Assist.*, 4 I.C.C.2d 164 (1987).

Subpart F—Exempt Abandonments to abandon a 32.05-mile portion of its Rockland Branch rail line in Tyler, Jasper, and Angelina Counties, TX, between milepost 76.85, at or near the Hillister rail station, and milepost 108.90, at or near the Dolan rail station.

SP has certified that: (1) No local traffic has moved over the line for at least 2 years; (2) any overhead traffic has been rerouted over other lines; and (3) no formal complaint filed by a user of rail service on the line (or a State or local government entity acting on behalf of such user) regarding cessation of service over the line either is pending with the Commission or any U.S. District Court or has been decided in favor of a complainant within the 2-year period. SP also has been certified that it has complied with the requirements at 49 CFR 1152.50(d)(1) (notice to government agencies), 49 CFR 1105.12 (newspaper publication), 49 CFR 1105.7, and 49 CFR 1105.8.

As a condition to this exemption, any employee affected by the abandonment shall be protected under Oregon Short Line R. Co.—Abandonment—Goshen, 360 I.C.C. 91 (1979). To address whether this condition adequately protects affected employees, a petition for partial revocation under 49 U.S.C. 10505(d) must be filed.

Provided no formal expression of intent to file an offer of financial assistance (OFA) has been received, this exemption will be effective on February 6, 1993, unless stayed pending reconsideration. Petitions to stay that do not involve environmental issues,[1] formal expressions of intent to file an OFA under 49 CFR 1152.27(c)(2),[2] and trail use/rail banking statements under 49 CFR 1152.29 must be filed by January 19, 1993.[3] Petitions to reopen or requests for public use conditions under 49 CFR 1152.28 must be filed by January 27, 1993 with: Office of the Secretary, Case Control Branch, Interstate Commerce Commission, Washington, DC 20423.

A copy of any petition filed with the Commission should be sent to applicant's representative: Gary A. Laakso, Southern Pacific Building, One Market Plaza, room 846, San Francisco, CA 94105.

If the notice of exemption contains false or misleading information, use of the exemption is void *ab initio*.

Applicant has filed an environmental report which addresses the abandonment's effects, if any, on the environmental or historic resources.

The Section of Energy and Environment (SEE) will issue an environmental assessment (EA) by January 12, 1993. Interested persons may obtain a copy of the EA from SEE by writing to it (Room 3219, Interstate Commerce Commission Building, Washington, DC 20423) or by calling Elaine Kaiser, Chief, SEE, at (202) 927–6248. Comments on environmental and historic preservation matters must be filed within 15 days after the EA becomes available to the public.

Environmental, historic preservation, public use, or trail use/rail banking conditions will be imposed, where appropriate, in a subsequent decision.

Decided: December 28, 1992.

By the Commission, Julia M. Farr, Acting Director, Office of Proceedings.

Sidney L. Strickland, Jr.,

Secretary.

[FR Doc. 93–178 Filed 1–5–93; 8:45 am]

BILLING CODE 7035–01–M

[1] A stay will be routinely issued by the Commission in these proceedings where an informed decision on environmental issues (whether raised by a party or by the Section of Energy and Environment in its independent investigation) cannot be made prior to the effective date of the notice of exemption. See Exemption of Out-of-Service Rail Lines, 5 I.C.C.2d 377 (1989). Any entity seeking a stay involving environmental concerns is encouraged to file its request as soon as possible to permit this Commission to review and act on the request before the effective date of this exemption.

[2] See Exempt. of Rail Abandonment—Offers of Finan. Assist., 4 I.C.C.2d 164 (1987).

[3] The Commission will accept late-filed trail use statements so long as it retains jurisdiction to do so.

DEPARTMENT OF JUSTICE

Drug Enforcement Administration

Importer of Controlled Substances; Registration

By Notice dated November 16, 1992, and published in the **Federal Register** on November 23, 1992, (57 FR 55000), North Pacific Trading Company, 1505 SE Gideon Street, Portland, Oregon 97202, made application to the Drug Enforcement Administration to be registered as an importer of Marihuana (7370), a basic class of controlled substance listed in Schedule I.

No comments or objections have been received. Therefore, pursuant to section 1008(a) of the Controlled Substances Import and Export Act and in accordance with title 21 Code of Federal Regulations § 1311.42, the above firm is granted registration as a importer of the basic class of controlled substance listed above.

Dated: December 29, 1992.

Gene R. Haislip,

Deputy Assistant Administrator, Office of Diversion Control, Drug Enforcement Administration.

[FR Doc. 93–236 Filed 1–5–93; 8:45 am]

BILLING CODE 4410–09–M

Importation of Controlled Substances; Application

Pursuant to section 1008 of the Controlled Substances Import and Export Act (21 U.S.C. 958(i)), the Attorney General shall, prior to issuing a registration under this section to a bulk manufacturer of a controlled substance in Schedule I or II and prior to issuing a regulation under section 1002(a) authorizing the importation of such a substance, provide manufacturers holding registrations for the bulk manufacture of the substance an opportunity for a hearing.

Therefore, in accordance with 1311.42 of title 21, Code of Federal Regulations (CFR), notice is hereby given that on December 3, 1992, Research Biochemicals Inc., One Strathmore Road, Natick, Massachusetts 01760, made a written request to the Drug Enforcement Administration to be registered as an importer of Morphine (9300) a basic class of controlled substance in Schedule II. The firm plans to import 2 grams of morphine-6 glucuronide for research purposes.

Any manufacturer holding, or applying for, registration as a bulk manufacturer of this basic class of controlled substance may file written comments on or objections to the application described above and may, at the same time, file a written request for a hearing on such application in accordance with 21 CFR 1301.54 in such form as prescribed by 21 CFR 1316.47.

Any such comments, objections, or requests for a hearing may be addressed to the Deputy Assistant Administrator, Office of Diversion Control, Drug Enforcement Administration, United States Department of Justice, Washington, DC 20537, Attention: DEA Federal Register Representative (CCR), and must be filed no later than February 5, 1993.

This procedure is to be conducted simultaneously with and independent of the procedures described in 21 CFR 1311.42(b), (c), (d), (e), and (f). As noted in a previous notice at 40 FR 43745–46 (September 23, 1975), all applicants for registration to import a basic class of any controlled substance in Schedule I or II are and will continue to be required to demonstrate to the Deputy Assistant

Administrator of the Drug Enforcement Administration that the requirements for such registration pursuant to 21 U.S.C. 958(a), 21 U.S.C. 823(a), and 21 CFR 1311.42(a), (b), (c), (d), (e), and (f) are satisfied.

Dated: December 28, 1992.

Gene R. Haislip,

Deputy Assistant Administrator, Office of Diversion Control, Drug Enforcement Administration.

BILLING CODE 4410–09–M

Manufacturer of Controlled Substances; Registration

By notice dated November 16, 1992, and published in the **Federal Register** on November 23, 1992, (57 FR 55002), Toxi-Lab, Inc., 2 Goodyear, Irvine, California 92718, made application to the Drug Enforcement Administration to be registered as a bulk manufacturer of the basic classes of controlled substances listed below:

Drug	Schedule
Phencyclidine (7471)	II
1-Piperidinocyclohexanecarbonitrile (8603).	II
Benzoylecgonine (9180)	II

No comments or objections have been received. Therefore, pursuant to section 303 of the Comprehensive Drug Abuse Prevention and Control Act of 1970 and title 21, Code of Federal Regulations § 1301.54(e), the Deputy Assistant Administrator hereby orders that the application for registration submitted by the above firm for registration as a bulk manufacturer of the basic classes of controlled substances listed above is granted.

Dated: December 29, 1992.

Gene R. Haislip,

Deputy Assistant Administrator, Office of Diversion Control, Drug Enforcement Administration.

[FR Doc. 93–238 Filed 1–5–93; 8:45 am]

BILLING CODE 4410–09–M

Manufacturer of Controlled Substances; Registration

By Notice dated November 16, 1992, and published in the **Federal Register** on November 23, 1992, (57 FR 52002), Upjohn Company, 7171 Portage Road, Kalamazoo, Michigan 49001, made application to the Drug Enforcement Administration to be registered as a bulk manufacturer of 2,5-Dimethoxyamphetamine (7396), a basic class of controlled substance listed in Schedule I.

No comments or objections have been received. Therefore, pursuant to section 303 of the Comprehensive Drug Abuse Prevention and Control Act of 1970 and title 21, Code of Federal Regulations § 1301.54(e), the Deputy Assistant Administrator hereby orders that the application for registration submitted by the above firm for registration as a bulk manufacturer of the basic class of controlled substance listed above is granted.

Dated: December 29, 1992.

Gene R. Haislip,

Deputy Assistant Administrator, Office of Diversion Control, Drug Enforcement Administration.

BILLING CODE 4410–09–M

Office of Justice Programs

Office for Victims of Crime; FY 1993 Assistance to Victims of Federal Crime in Indian Country Discretionary Grant Program Application Kit

AGENCY: Office of Justice Programs, Office for Victims of Crime, DOJ.

ACTION: Public announcement of the availability of the FY 1993 Assistance to Victims of Federal Crime in Indian Country Discretionary Grant Program Application Kit for first-time applicants.

SUMMARY: The Office for Victims of Crime (OVC) is publishing this Notice of availability of the FY 1993 Discretionary Grant Application Kit for the State agencies appointed by the Governors in Alabama, Colorado, Iowa, Louisiana, Mississippi, Nebraska, North Carolina, and Texas.

DATES: Applications must be submitted to the Office for Victims of Crime by the due date indicated in the Application Kit.

ADDRESSES: Applications should be addressed to the Office for Victims of Crime, Federal Crime Victims Division, room 1386, 633 Indiana Avenue, NW., Washington, DC 20531. To obtain a copy of the Application Kit, call (202) 616–3579.

FOR FURTHER INFORMATION CONTACT: Toni Thomas, Program Specialist, at the above address. Telephone: (202) 514–6444.

SUPPLEMENTARY INFORMATION:

Authority

The action is authorized under Sec. 1404(c)(1)(B) of the Victims of Crime Act of 1984 (VOCA), as amended, 42 U.S.C. 10603(c)(1)(B).

Background

In 1988 OVC initiated a program of making grants to State victim assistance programs for the purpose of awarding subgrants to Indian tribes or tribal organizations. This has resulted in the expansion of victim assistance programs in tribal communities in 15 different States. These States are working with Indian tribes to enhance the network of services developed by using a combination of Federal, State and tribal funds. OVC now plans to extend this successful program so that other tribes in areas of Federal jurisdiction can work with State victim assistance programs to establish victim assistance services in their communities.

On November 4, 1992, the Office for Victims of Crime, published a Notice in the Federal **Register**, 57 FR 52639, announcing the FY 1993 Comprehensive Discretionary Program Plan. That publication announced the availability of $250,000 to eligible States for Assistance to Victims of Federal Crime in Indian Country. The Assistance to Victims of Federal Crime in Indian Country Discretionary Grant Application Kit, announced herein, expands upon information provided in the program plan and defines specific application requirements and deadlines.

Brenda G. Meister,

Acting Director, Office for Victims of Crime.

BILLING CODE 4410–18–M

DEPARTMENT OF LABOR

Office of the Secretary

Glass Ceiling Commission; Open Meeting

SUMMARY: Pursuant to title II of the Civil Rights Act of 1991 (Pub. L. 102–166) and section 9 of the Federal Advisory Committee Act (FACA) (Pub. L. 92–462, 5 U.S.C. app. II) a Notice of Establishment of the Glass Ceiling Commission was published in the **Federal Register** on March 30, 1992 (57 FR 10776). Pursuant to section 10(a) of FACA, this is to announce a meeting of the Commission which is to take place on Monday, January 25, 1993.

The purpose of the Commission is to, among other things, focus greater attention on the importance of eliminating artificial barriers to the advancement of minorities and women to management and decision making positions in business. The Commission has the practical task of:

(a) Conducting basic research into the practices, policies and manner in which

management and decision making positions in business are filled;

(b) Conducting comparative research of businesses and industries in which minorities and women are promoted to management and decision making positions, and businesses and industries in which minorities and women are not promoted to such positions; and

(c) Recommending measures designed to enhance opportunities for and the elimination of artificial barriers to the advancement of minorities and women to management and decision making positions.

TIME AND PLACE: The meeting will be held on Monday, January 25, 1993 from 10 a.m. to 5 p.m. at the U.S. Department of Labor, 200 Constitution Avenue, NW., room C–2313, Washington, DC.

AGENDA: The agenda for the meeting is as follows:

(a) Introduction of Commission Members;

(b) Discussion of procedures to be followed in conducting Commission business;

(c) Discussion of Commission objectives including, to the extent practicable, a delineation of specific tasks and projected time frames for achieving such objectives; and

(d) Ancillary considerations attendant to ongoing Commission activities.

PUBLIC PARTICIPATION: The meeting will be open to the public. Seating will be available to the public on a first-come, first-served basis. Seats will be reserved for the media. Handicapped individuals should contact the Commission if special accommodations are needed. Individuals or organizations wishing to submit written statements should send thirty (30) copies to Mrs. Elizabeth Leonard, Executive Director, Glass Ceiling Commission, U.S. Department of Labor, 200 Constitution Avenue, NW., room S–2018, Washington, DC 20210.

FOR FURTHER INFORMATION CONTACT: Mrs. Elizabeth Leonard, Executive Director, Glass Ceiling Commission, U.S. Department of Labor, 200 Constitution Avenue, NW., room S–2018, Washington, DC 20210, (202) 219–8271.

Signed at Washington, DC this 30th day of December, 1992.

Lynn Martin,

Secretary of Labor.

Lally Manufacturing Corp.; Adams, New York, New York Mill, NY and Port Leyden, NY; Dismissal of Application for Reconsideration

Pursuant to 29 CFR 90.18 an application for administrative reconsideration was filed with the Director of the Office of Trade Adjustment Assistance for workers at Lally Manufacturing Corporation, Adams, New York, New York Mill, New York and Port Leyden, New York. The review indicated that the application contained no new substantial information which would bear importantly on the Department's determination. Therefore, dismissal of the application was issued.

BILLING CODE 4510–30–M

Investigations Regarding Certifications of Eligibility To Apply for Worker Adjustment Assistance

Petitions have been filed with the Secretary of Labor under section 221(a) of the Trade Act of 1974 ("the Act") and are identified in the Appendix to this notice. Upon receipt of these petitions, the Director of the Office of Trade Adjustment Assistance, Employment and Training Administration, has instituted investigations pursuant to section 211(a) of the Act.

The purpose of each of the investigations is to determine whether the workers are eligible to apply for adjustment assistance under title II, chapter 2, of the Act. The investigations will further relate, as appropriate, to the determination of the date on which total or partial separations began or threatened to begin and the subdivision of the firm involved.

The petitioners or any other persons showing a substantial interest in the subject matter of the investigations may request a public hearing, provided such request is filed in writing with the Director, Office of Trade Adjustment Assistance, at the address shown below, not later than January 18, 1993.

Interested persons are invited to submit written comments regarding the subject matter of the investigations to the Director, Office of Trade Adjustment Assistance, at the address shown below, not later than January 18, 1993.

The petitions filed in this case are available for inspection at the Office of the Director, Office of Trade Adjustment Assistance, Employment and Training Administration, U.S. Department of Labor, 200 Constitution Avenue, NW., Washington, DC 20210.

Signed at Washington, DC this 21st day of December, 1992.

Marvin M. Fooks,

Director, Office of Trade Adjustment Assistance.

Job Training Partnership Act; Announcement of Proposed Noncompetitive Grant Awards

AGENCY: Employment and Training Administration, Labor.

ACTION: Notice of intent to award a noncompetitive grant.

SUMMARY: The Employment and Training Administration (ETA) announces its intent to award a noncompetitive grant to The Association for Manufacturing Technology, McLean, Virginia, for the provision of specialized services under the authority of the Job Training Partnership Act (JTPA).

DATES: It is anticipated that this grant award will be executed by January 29, 1993, and will be funded for twelve months. Submit comments by 4:45 p.m. (Eastern Time), on January 21, 1993.

ADDRESSES: Submit comments regarding this proposed assistance award to: U.S. Department of Labor, Employment and Training Administration, room C–4305, 200 Constitution Avenue, NW., Washington, DC 20210, Attention: Reda Harrison: Reference FR–DAA–008–92.

SUPPLEMENTARY INFORMATION: The Employment and Training Administration (ETA) announces its intent to award a noncompetitive grant to The Association for Manufacturing Technology (AMT) of McLean, Virginia, in accordance with the Department of Labor Manual Series (DLMS), Volume No. 2, section 836(g)(5). AMT will produce a series of national satellite teleconferencing programs on state of the art manufacturing technology designed to accelerate the implementation of advanced manufacturing technology methods for U.S. machine tool manufacturers. In line with DOL's Technical & Education Assistance for Mid- and Small-sized firms (TEAMS) initiative, AMT will test teleconferencing as a methodology for building small firm networks to train workers for high performance. The majority of member companies which will participate in the downlink broadcasts employs less than 70 persons. AMT's ultimate goal through the BETA series broadcast is to establish highly replicable outcomes for the U.S. machine tool and other industries in need of increasing the skills of their workforce.

Funds for this activity are authorized by the Job Training Partnership Act, as amended, Title IV—Federally Administered Programs. The proposed funding is approximately $100,000 for twelve months.

Signed at Washington, DC on December 17, 1992.

Robert D. Parker,

ETA Grant Officer.

[FR Doc. 93–157 Filed 1–5–93; 8:45 am]

BILLING CODE 4510–30–M

Job Training Partnership Act; Announcement of Proposed Noncompetitive Grant Award

AGENCY: Employment and Training Administration, Labor.

ACTION: Notice of intent to award a noncompetitive grant.

SUMMARY: The Employment and Training Administration (ETA) announces its intent to award a noncompetitive grant to the Bay State Center for Applied Technology of Boston, Massachusetts to participate in the development and operation of a comprehensive network of small machine shops in Western Massachusetts.

DATES: It is anticipated that this grant award will be executed by January 29, 1993, and will be funded for twenty-four months. Submit comments by 4:45 p.m. (Eastern Time), on January 21, 1993.

ADDRESSES: Submit comments regarding this proposed assistance award to: U.S. Department of Labor, Employment and Training Administration, room C–4305, 200 Constitution Avenue, NW., Washington, DC 20210, Attention: Laura Cesario; Reference FR–DAA–010–92.

SUPPLEMENTAL INFORMATION: The Employment and Training Administration (ETA) announces its intent to award a noncompetitive grant to the Bay State Center for Applied Technology, in accordance with the Department of Labor Manual Series (DLMS), Volume No. 2, section 836(g)(4). The Bay State Center for Applied Technology will be part of a partnership to develop a comprehensive skills upgrading program that will be combined with industrial modernization strategies for small and mid-sized firms. The partnership will consist of the State of Massachusetts, the Western Massachusetts National Tooling and Machining Association, and the Western Massachusetts Precision Institute. This project will support the Department of Labor Technical and Education Assistance for Mid- and Small-sized firms (TEAMS) goal to support the provision of a broad range of services in the areas of technical training and work restructuring. The partnership with the Bay State Center for Applied Technology supports the goals of TEAMS in its development and operation of a comprehensive network of small machine shops in Western Massachusetts.

Funds for this activity are authorized by the Job Training Partnership Act, as amended, Title IV—Federally Administered Programs. The proposed funding is approximately $200,000 for twenty-four months.

Signed at Washington, DC on December 17, 1992.

Robert D. Parker,

ETA Grant Officer.

BILLING CODE 4510–30–M

Job Training Partnership Act; Announcement of Proposed Noncompetitive Grant Award

AGENCY: Employment and Training Administration, Labor.

ACTION: Notice of intent to award a noncompetitive grant.

SUMMARY: The Employment and Training Administration (ETA) announces its intent to award a noncompetitive grant to the United Auto Workers Labor Employment and Training Company of New York, New York to develop a model approach for training and human resource development for small and mid-size firms in the international trade and financial sectors.

DATES: It is anticipated that this grant award will be executed by January 29, 1993, and will be funded for six months. Submit comments by 4:45 p.m. (Eastern Time), on January 21, 1993.

ADDRESSES: Submit comments regarding this proposed assistance award to: U.S. Department of Labor, Employment and Training Administration, room C–4305, 200 Constitution Avenue, NW., Washington, DC 20210, Attention: Laura Cesario; Reference FR–DAA–011–92.

SUPPLEMENTARY INFORMATION: The Employment and Training Administration (ETA) announces its intent to award a noncompetitive grant to the United Auto Workers Labor and Employment Company (UAW–LETC), in accordance with the Department of Labor Manual Series (DLMS), Volume No. 2, section 836(g)(4). In cooperation with the Port Authority of New York and the UAW–LETC, a model approach for training and human resource development for small and mid-size firms in the international trade and financial sectors would be developed. The partnership will assist World Trade Center companies in meeting their human resource needs by offering placement, training and other human resource services, specifically tailored to the needs of those companies. This project will support the Department of Labor Technical and Education Assistance for Mid- and Small-sized firms (TEAMS) goal to support the provision of a broad range of services in the areas of technical training and work restructuring. The partnership with the UAW–LETC presents a unique opportunity to develop worker skill assessment tools for use on a national basis in the service sector of the economy, an area of significant importance to the TEAMS outreach program, and one in which TEAMS needs to develop technical assistance tools.

Funds for this activity are authorized by the Job Training Partnership Act, as amended, Title IV—Federally Administered Programs. The proposed funding is approximately $75,000 for six months.

Signed at Washington, DC on December 17, 1992.

Robert D. Parker,

ETA Grant Officer.

NATIONAL AERONAUTICS AND SPACE ADMINISTRATION

[Notice 92–79]

Landsat Advisory Process

AGENCY: National Aeronautics and Space Administration.

ACTION: Request for public advice and comments.

SUMMARY: This request for public advice and comments is issued pursuant to Public Law 102–555, the Land Remote Sensing Policy Act of 1992, dated October 1992. Section 101(e) of this Law requires the Landsat Program Management to seek impartial advice and comments regarding the status, effectiveness, and diversity of the program plans from individuals who represent a broad range of public and private sector perspectives and a full spectrum of interest in the Landsat program and other data and services it provides. Those wishing to provide such advice and comments, via a survey which will be used as input for a report to Congress, can obtain further information on the Landsat advisory process by contacting Stanley R. Schneider, Landsat Advisory Process Coordinator, National Aeronautics and Space Administration, Code SED, 300 E Street, SW., Washington, DC 20546. Fax: (202) 358–3098.

DATES: Comments must be received on or before February 1, 1993.

FOR FURTHER INFORMATION CONTACT: Stanley R. Schneider at the address above.

Dated: December 30, 1992.

L.A. Fisk,

Associate Administrator for Space Science and Applications.

BILLING CODE 7510–01–M

NUCLEAR REGULATORY COMMISSION

[Docket Nos. 50–269, 50–270, and 50–287]

Duke Power Co.; Oconee Nuclear Station, Unit Nos. 1, 2, and 3; Environmental Assessment and Finding of No Significant Impact

The U.S. Nuclear Regulatory Commission (NRC) is considering issuance of amendments to Facility Operating License Nos. DPR–38, DPR–47, and DPR–55 issued to the Duke Power Company (the licensee), for operation of the Oconee Nuclear Station, Units 1, 2, 3, located in Oconee County, South Carolina.

Environmental Assessment

Identification of Proposed Action

The proposed action would revise the limitations on concentrations of radioactive material released in liquid effluents and the limitations on the dose rate resulting from radioactive material released in gaseous effluents, and reflect the relocation of the prior 10 CFR 20.106 requirements to the new 10 CFR 20.1302. These changes are in response to the new 10 CFR part 20. The review of an additional item, to revise the BASES for the liquid holdup tank TS, was not completed and consequently is not included in the amendment. It will be addressed by separate correspondence.

The Need for the Proposed Action

The proposed action is needed in order to retain operational flexibility consistent with 10 CFR part 50, Appendix I, concurrent with the implementation of the revised 10 CFR part 20.

Environmental Impacts of the Proposed Action

The proposed revision does not change the actual release rates as referenced in the TS as a dose rate to the maximally exposed member of the public. Therefore, there will be no increase in the types or amounts of effluents that may be released offsite, nor an increase in individual or cumulative occupational radiation exposures. Therefore, the Commission

concludes that there are no significant radiological environmental impacts associated with the proposed changes.

With regard to potential nonradiological impacts, the proposed changes do not affect nonradiological effluent and have no other environmental impact. Therefore, the Commission concludes that there are no significant non-radiological impacts associated with the proposed changes.

Alternative to the Proposed Action

Since the Commission's staff has concluded that there is no significant environmental impact associated with the proposed changes to the TS, any alternative to the amendments will have either no significantly different environmental impact or greater environmental impact. The principal alternative would be to deny the requested amendments. This would not reduce environmental impacts as a result of plant operation.

Alternative Use of Resources

This action does not involve the use of resources not previously considered in connection with the Final Environmental Statement related to the operation of the Oconee Nuclear Station, Units 1, 2, and 3, dated March 1972.

Agencies and Persons Consulted

The Commission's staff did not consult other agencies or persons.

Finding of No Significant Impact

The Commission has determined not to prepare an environmental impact statement for the proposed license amendments.

Based on the above environmental assessment, the Commission concludes that the proposed action will not have a significant effect on the quality of the human environment.

For further information with respect to this action, see the application dated November 5, 1992, as supplemented December 9 and 18, 1992, which is available for public inspection at the Commission's Public Document Room, 1717 H Street, NW., Washington, DC and at the Oconee County Library, 501 West South Broad Street, Walhalla, South Carolina.

Dated at Rockville, Maryland, this 30th day of December 1992.

For the Nuclear Regulatory Commission.

Timothy A. Reed,

Acting Director, Project Directorate II–3, Division of Reactor Projects—I/II, Office of Nuclear Reactor Regulation.

[FR Doc. 93–170 Filed 1–5–93; 8:45 am]

BILLING CODE 7590–01–M

[Docket Nos. 50–369 and 50–370]

Duke Power Co., McGuire Nuclear Station, Unit Nos. 1 and 2; Environmental Assessment and Finding of No Significant Impact

The U.S. Nuclear Regulatory Commission (NRC) is considering issuance of amendments to Facility Operating License Nos. NPF–9 and NPF–17 issued to the Duke Power Company (the licensee), for operation of the McGuire Nuclear Station, Units 1 and 2, located in Mecklenburg County, North Carolina.

Environmental Assessment

Identification of Proposed Action

The proposed action would revise the limitations on concentrations of radioactive material released in liquid effluents and the limitations on the dose rate resulting from radioactive material released in gaseous effluents, and reflect the relocation of the prior 10 CFR 20.106 requirements to the new 10 CFR 20.1302. These changes are in response to the new 10 CFR part 20. The review of an additional item, to revise the BASES for the liquid holdup tank TS, was not completed and consequently is not included in the amendment. It will be addressed by separate correspondence.

The Need for the Proposed Action

The proposed action is needed in order to retain operational flexibility consistent with 10 CFR part 50, appendix I, concurrent with the implementation of the revised 10 CFR part 20.

Environmental Impacts of the Proposed Action

The proposed revision does not change the actual release rates as referenced in the TS as a dose rate to the maximally exposed member of the public. Therefore, there will be no increase in the types or amounts of effluents that may be released offsite, nor an increase in individual or cumulative occupational radiation exposures. Therefore, the Commission concludes that there are no significant radiological environmental impacts associated with the proposed changes.

With regard to potential nonradiological impacts, the proposed changes do not affect nonradiological effluent and have no other environmental impact. Therefore, the Commission concludes that there are no significant nonradiological impacts associated with the proposed changes.

Alternative to the Proposed Action

Since the Commission's staff has concluded that there is no significant environmental impact associated with the proposed changes to the TS, any alternative to the amendments will have either no significantly different environmental impact or greater environmental impact. The principal alternative would be to deny the requested amendments. This would not reduce environmental impacts as a result of plant operation.

Alternative Use of Resources

This action does not involve the use of resources not previously considered in connection with the Final Environmental Statement related to the operation of William B. McGuire Nuclear Station, Units 1 and 2 dated April 1976, and its addendum dated January 1981.

Agencies and Persons Consulted

The Commission's staff did not consult other agencies or persons.

Finding of No Significant Impact

The Commission has determined not to prepare an environmental impact statement for the proposed license amendments.

Based on the above environmental assessment, the Commission concludes that the proposed action will not have a significant effect on the quality of the human environment.

For further information with respect to this action, see the application dated November 5, 1992, as supplemented December 9 and 18, 1992, which is available for public inspection at the Commission's Public Document Room, 1717 H Street, NW., Washington, DC and at the Atkins Library, University of North Carolina (UNCC Station), North Carolina 28223.

Dated at Rockville, Maryland, this 30th day of December, 1992.

For the Nuclear Regulatory Commission.

Timothy A. Reed,

Acting Director, Project Directorate II–3, Division of Reactor Projects—I/II Office of the Nuclear Reactor Regulation.

BILLING CODE 7590–01–M

[Docket Nos. 50–413 and 50–414]

Duke Power Co., et al., Catawba Nuclear Station, Unit Nos. 1 and 2; Environmental Assessment and Finding of No Significant Impact

The U.S. Nuclear Regulatory Commission (NRC) is considering issuance of amendments to Facility

Operating License Nos. NPF–35 and NPF–52 issued to the Duke Power Company (the licensee), for operation of the Catawba Nuclear Station, Units 1 and 2, located in York County, South Carolina.

Environmental Assessment

Identification of Proposed Action

The proposed action would revise the limitations on concentrations of radioactive material released in liquid effluents and the limitations on the dose rate resulting from radioactive material released in gaseous effluents, and reflect the relocation of the prior 10 CFR 20.106 requirements to the new 10 CFR 20.1302. These change are in response to the new 10 CFR part 20. The review of an additional item, to revise the BASES for the liquid holdup tank TS, was not completed and consequently is not included in the amendment. It will be addressed by separate correspondence.

The Need for the Proposed Action

The proposed action is needed in order to retain operational flexibility consistent with 10 CFR part 50, appendix I, concurrent with the implementation of the revised 10 CFR part 20.

Environmental Impacts of the Proposed Action

The proposed revision does not change the actual release rates as referenced in the TS as a dose rate to the maximally exposed member of the public. Therefore, there will be no increase in the types or amounts of effluents that may be released offsite, nor an increase in individual or cumulative occupational radiation exposures. Therefore, the Commission concludes that there are no significant radiological environmental impacts associated with the proposed changes.

With regard to potential nonradiological impacts, the proposed changes do not affect nonradiological effluent and have no other environmental impact. Therefore, the Commission concludes that there are no significant nonradiological impacts associated with the proposed changes.

Alternative to the Proposed Action

Since the Commission's staff has concluded that there is no significant environmental impact associated with the proposed changes to the TS, any alternative to the amendments will have either no significantly different environmental impact or greater environmental impact. The principal alternative would be to deny the requested amendments. This would not reduce environmental impacts as a result of plant operation.

Alternative Use of Resources

This action does not involve the use of resources not previously considered in connection with the Final Environmental Statement related to the operation of the Catawba Nuclear Station, Units 1 and 2, dated January 1983.

Agencies and Persons Consulted

The Commission's staff did not consult other agencies or persons.

Finding of No Significant Impact

The Commission has determined not to prepare an environmental impact statement for the proposed license amendments.

Based on the above environmental assessment, the Commission concludes that the proposed action will not have a significant effect on the quality of the human environment.

For further information with respect to this action, see the application dated November 5, 1992, as supplemented December 9 and 18, 1992, which is available for public inspection at the Commission's Public Document Room, 1717 H Street, NW., Washington, DC and at the York County Library, 138 East Black Street, Rock Hill, South Carolina.

Dated at Rockville, Maryland, this 30th day of December, 1992.

For the Nuclear Regulatory Commission.

Timothy A. Reed,

Acting Director, Project Directorate II–3, Division of Reactor Projects—I/II, Office of Nuclear Reactor Regulation.

[FR Doc. 93–168 Filed 1–5–93; 8:45 am]

BILLING CODE 7590–01–M

[Docket No. 50–245]

Northeast Nuclear Energy Co., Millstone Nuclear Power Station, Unit 1; Environmental Assessment and Finding of No Significant Impact

The U.S. Nuclear Regulatory Commission (the Commission) is considering issuance of a one-time exemption from 10 CFR 50, appendix J, paragraph III.A.6(b) to the Northeast Nuclear Energy Company (NNECO or the licensee) for Millstone Nuclear Power Station, Unit 1, located in New London County, Connecticut.

Environmental Assessment

Identification of the Proposed Action

The proposed action would grant a one-time exemption to provide relief from the accelerated Type A containment integrated leak rate test frequency required by appendix J to 10 CFR part 50 when two consecutive Type A tests have failed to meet their acceptance criteria.

The Need for the Proposed Action

One of the conditions of all operating licenses for water-cooled power reactors, as specified in 10 CFR 50.54(o), is that primary reactor containments shall meet the containment leakage test requirements set forth in 10 CFR part 50, appendix J.

Appendix J to 10 CFR part 50, paragraph III.A.6(b), requires, in part, that if two consecutive periodic Type A tests fail to meet the applicable acceptance criteria in III.A.5(b), a Type A test shall be performed at each plant shutdown for refueling or approximately 18 months, whichever occurs first, until two consecutive Type A tests meet the acceptance criteria in III.A.5(b), after which time the normal retest schedule specified in III.D (three tests in 10 years) may be resumed.

NRC Information Notice (IN) No. 85–71 states that licensees may submit a Corrective Action Plan (CAP) with an alternate leakage test program proposal as an exemption request for NRC staff review if it is determined that Type B and C leakage rates constitute the identified contributor to the failure of the two Type A tests. If the CAP and alternate leakage rate test program is approved, the licensee is allowed to implement the corrective action and alternate leakage rate test program in lieu of the required increase in Type A test frequency.

Millstone Unit 1 experienced failures of the "As-Found" Type A tests in 1987 and 1991, therefore, a test is required to be performed during the present operating cycle in late December 1992 or January 1993. In order to perform this required Type A test, Millstone Unit 1 would have to undergo a forced shutdown. Such a shutdown would result in an increase in occupational radiation exposure and an additional transient on the plant.

Because the licensee determined that Type C local leakage rates were the reason for the "As-Found" Type A test failures, NNECO submitted a CAP with an alternate leakage test program proposal in lieu of the required accelerated testing and a request for exemption from 10 CFR 50, Appendix J, Paragraph III.A.6(b).

Environmental Impacts of the Proposed Action

The proposed action would provide a one-time exemption from the accelerated Type A containment integrated leak rate test frequency

required by appendix J to 10 CFR part 50 when two consecutive Type A tests have failed to meet their acceptance criteria. The NRC staff has reviewed the proposed exemption and concluded that the licensee's CAP and alternate leakage rate test program are acceptable. The NRC staff finds that the CAP and alternate leakage rate test program are an acceptable alternative to the increased Type A test frequency (every 18 months) and that there is reasonable assurance that the containment leakage-limiting function will be maintained. Therefore, the subject exemption is acceptable and the licensee will return to the normal test schedule of three tests in 10 years. With the normal test schedule, Type A tests would be scheduled to be performed at the next two plant shutdowns for refueling (currently expected to be in 1994 and 1996).

Thus, radiological releases will not differ from those determined previously and the proposed exemption does not otherwise affect facility radiological effluent or occupational exposures. With regard to potential nonradiological impacts, the proposed exemption does not affect plant nonradiological effluents and have no other environmental impact. Therefore, the Commission concludes there are no measurable radiological or nonradiological environmental impacts associated with the proposed exemption.

Alternatives to the Proposed Action

Since the Commission has concluded there is no measurable environmental impact associated with the proposed exemptions, any alternatives with equal or greater environmental impact need not be evaluated. The principal alternative to the exemptions would be to deny the exemptions requested. Such action would not enhance the protection of the environment.

Alternative Use of Resources

This action does not involve the use of resources not considered previously in the Final Environmental Statement for Millstone Nuclear Power Station, Unit 1.

Agencies and Persons Consulted

The NRC staff reviewed the licensee's request and did not consult other agencies or persons.

Finding of No Significant Impact

Based on the foregoing environmental assessment, the Commission concludes that the proposed action will not have a significant effect on the quality of the human environment. Accordingly, the Commission has determined not to prepare an environmental impact statement for the proposed exemptions.

For further details with respect to this proposed action, see the licensee's letter dated November 4, 1992, which is available for public inspection at the Commission's Public Document Room, the Gelman Building, 2120 L Street, NW., Washington, DC 20555, and at the local public document room located at the Learning Resources Center, Thames Valley State Technical College, 574 New London Turnpike, Norwich, Connecticut 06360.

Dated at Rockville, Maryland this 30th day of December, 1992.

For the Nuclear Regulatory Commission.

John F. Stolz,

Director, Project Directorate I–4, Division of Reactor Projects—I/II, Office of Nuclear Reactor Regulation.

[FR Doc. 93–172 Filed 1–5–93; 8:45 am]

BILLING CODE 7590–01–M

Biweekly Notice

Applications and Amendments to Operating Licenses Involving No Significant Hazards Considerations

I. Background

Pursuant to Public Law (P.L.) 97-415, the Nuclear Regulatory Commission (the Commission or NRC staff) is publishing this regular biweekly notice. P.L. 97-415 revised section 189 of the Atomic Energy Act of 1954, as amended (the Act), to require the Commission to publish notice of any amendments issued, or proposed to be issued, under a new provision of section 189 of the Act. This provision grants the Commission the authority to issue and make immediately effective any amendment to an operating license upon a determination by the Commission that such amendment involves no significant hazards consideration, notwithstanding the pendency before the Commission of a request for a hearing from any person.

This biweekly notice includes all notices of amendments issued, or proposed to be issued from December 12, 1992, through December 23, 1992. The last biweekly notice was published on December 23, 1992 (57 FR 61105).

Notice Of Consideration Of Issuance Of Amendment To Facility Operating License, Proposed No Significant Hazards Consideration Determination, And Opportunity For a Hearing

The Commission has made a proposed determination that the following amendment requests involve no significant hazards consideration. Under the Commission's regulations in 10 CFR 50.92, this means that operation of the facility in accordance with the proposed amendments would not (1) involve a significant increase in the probability or consequences of an accident previously evaluated; or (2) create the possibility of a new or different kind of accident from any accident previously evaluated; or (3) involve a significant reduction in a margin of safety. The basis for this proposed determination for each amendment request is shown below.

The Commission is seeking public comments on this proposed determination. Any comments received within 30 days after the date of publication of this notice will be considered in making any final determination. The Commission will not normally make a final determination unless it receives a request for a hearing.

Written comments may be submitted by mail to the Rules and Directives Review Branch, Division of Freedom of Information and Publications Services, Office of Administration, U.S. Nuclear Regulatory Commission, Washington, DC 20555, and should cite the publication date and page number of this **Federal Register** notice. Written comments may also be delivered to Room P-223, Phillips Building, 7920 Norfolk Avenue, Bethesda, Maryland from 7:30 a.m. to 4:15 p.m. Federal workdays. Copies of written comments received may be examined at the NRC Public Document Room, the Gelman Building, 2120 L Street, NW., Washington, DC 20555. The filing of requests for hearing and petitions for leave to intervene is discussed below.

By February 5, 1993, the licensee may file a request for a hearing with respect to issuance of the amendment to the subject facility operating license and any person whose interest may be affected by this proceeding and who wishes to participate as a party in the proceeding must file a written request for a hearing and a petition for leave to intervene. Requests for a hearing and a petition for leave to intervene shall be filed in accordance with the Commission's "Rules of Practice for Domestic Licensing Proceedings" in 10 CFR Part 2. Interested persons should consult a current copy of 10 CFR 2.714 which is available at the Commission's Public Document Room, the Gelman Building, 2120 L Street, NW., Washington, DC 20555 and at the local public document room for the particular facility involved. If a request for a hearing or petition for leave to intervene is filed by the above date, the Commission or an Atomic Safety and Licensing Board, designated by the

Commission or by the Chairman of the Atomic Safety and Licensing Board Panel, will rule on the request and/or petition; and the Secretary or the designated Atomic Safety and Licensing Board will issue a notice of hearing or an appropriate order.

As required by 10 CFR 2.714, a petition for leave to intervene shall set forth with particularity the interest of the petitioner in the proceeding, and how that interest may be affected by the results of the proceeding. The petition should specifically explain the reasons why intervention should be permitted with particular reference to the following factors: (1) the nature of the petitioner's right under the Act to be made a party to the proceeding; (2) the nature and extent of the petitioner's property, financial, or other interest in the proceeding; and (3) the possible effect of any order which may be entered in the proceeding on the petitioner's interest. The petition should also identify the specific aspect(s) of the subject matter of the proceeding as to which petitioner wishes to intervene. Any person who has filed a petition for leave to intervene or who has been admitted as a party may amend the petition without requesting leave of the Board up to fifteen (15) days prior to the first prehearing conference scheduled in the proceeding, but such an amended petition must satisfy the specificity requirements described above.

Not later than fifteen (15) days prior to the first prehearing conference scheduled in the proceeding, a petitioner shall file a supplement to the petition to intervene which must include a list of the contentions which are sought to be litigated in the matter. Each contention must consist of a specific statement of the issue of law or fact to be raised or controverted. In addition, the petitioner shall provide a brief explanation of the bases of the contention and a concise statement of the alleged facts or expert opinion which support the contention and on which the petitioner intends to rely in proving the contention at the hearing. The petitioner must also provide references to those specific sources and documents of which the petitioner is aware and on which the petitioner intends to rely to establish those facts or expert opinion. Petitioner must provide sufficient information to show that a genuine dispute exists with the applicant on a material issue of law or fact. Contentions shall be limited to matters within the scope of the amendment under consideration. The contention must be one which, if proven, would entitle the petitioner to relief. A petitioner who fails to file such a supplement which satisfies these requirements with respect to at least one contention will not be permitted to participate as a party.

Those permitted to intervene become parties to the proceeding, subject to any limitations in the order granting leave to intervene, and have the opportunity to participate fully in the conduct of the hearing, including the opportunity to present evidence and cross-examine witnesses.

If a hearing is requested, the Commission will make a final determination on the issue of no significant hazards consideration. The final determination will serve to decide when the hearing is held.

If the final determination is that the amendment request involves no significant hazards consideration, the Commission may issue the amendment and make it immediately effective, notwithstanding the request for a hearing. Any hearing held would take place after issuance of the amendment.

If the final determination is that the amendment request involves a significant hazards consideration, any hearing held would take place before the issuance of any amendment.

Normally, the Commission will not issue the amendment until the expiration of the 30-day notice period. However, should circumstances change during the notice period such that failure to act in a timely way would result, for example, in derating or shutdown of the facility, the Commission may issue the license amendment before the expiration of the 30-day notice period, provided that its final determination is that the amendment involves no significant hazards consideration. The final determination will consider all public and State comments received before action is taken. Should the Commission take this action, it will publish in the **Federal Register** a notice of issuance and provide for opportunity for a hearing after issuance. The Commission expects that the need to take this action will occur very infrequently.

A request for a hearing or a petition for leave to intervene must be filed with the Secretary of the Commission, U.S. Nuclear Regulatory Commission, Washington, DC 20555, Attention: Docketing and Services Branch, or may be delivered to the Commission's Public Document Room, the Gelman Building, 2120 L Street, NW., Washington DC 20555, by the above date. Where petitions are filed during the last ten (10) days of the notice period, it is requested that the petitioner promptly so inform the Commission by a toll-free telephone call to Western Union at 1-(800) 325-6000 (in Missouri 1-(800) 342-6700). The Western Union operator should be given Datagram Identification Number N1023 and the following message addressed to (**Project Director**): petitioner's name and telephone number, date petition was mailed, plant name, and publication date and page number of this **Federal Register** notice. A copy of the petition should also be sent to the Office of the General Counsel, U.S. Nuclear Regulatory Commission, Washington, DC 20555, and to the attorney for the licensee.

Nontimely filings of petitions for leave to intervene, amended petitions, supplemental petitions and/or requests for hearing will not be entertained absent a determination by the Commission, the presiding officer or the Atomic Safety and Licensing Board that the petition and/or request should be granted based upon a balancing of factors specified in 10 CFR 2.714(a)(1)(i)-(v) and 2.714(d).

For further details with respect to this action, see the application for amendment which is available for public inspection at the Commission's Public Document Room, the Gelman Building, 2120 L Street, NW., Washington, DC 20555, and at the local public document room for the particular facility involved.

Arizona Public Service Company, et al., Docket Nos. STN 50-528, STN 50-529, and STN 50-530, Palo Verde Nuclear Generating Station, Unit Nos. 1, 2, and 3, Maricopa County, Arizona

Date of amendment requests: November 20, 1992

Description of amendment requests: The amendment requests propose to increase the allowable out-of-service time for the Core Operating Limit Supervisory System (COLSS) from one hour to four hours before the more restrictive limits based on the Core Protection Calculators (CPCs) must be applied.

Basis for proposed no significant hazards consideration determination: As required by 10 CFR 50.91(a), the licensees have provided their analysis about the issue of no significant hazards consideration, which is presented below:

Standard 1 -- Involve a significant increase in the probability or consequences of an accident previously evaluated.

This proposed amendment distinguishes between the ACTION requirements applicable when COLSS is either in service or out of service. If COLSS is in service the ACTIONs and time requirements remain unchanged. When COLSS is out of service the requirement for initiating corrective action within 15 minutes is replaced with the requirement to restore linear heat rate (LHR)

and departure from nucleate boiling ratio (DNBR) within 4 hours. The purpose of the proposed amendment is to provide a reasonable opportunity for appropriate corrective actions when the COLSS becomes inoperable.

The technical specification (TS) Limiting Conditions for Operation (LCOs) for DNBR margin and LHR are more restrictive when operating without the COLSS due to the uncertainties associated with the CPCs. Consequently, when the COLSS becomes inoperable, the existing LHR and DNBR limits based on CPC information can only be satisfied by either a power reduction or by restoring the COLSS to service. By itself, a loss of the COLSS or returning the COLSS to service does not affect plant operation and does not affect the actual DNBR or the LHR. In addition, a loss of the COLSS does not constitute a change in actual core power distribution. Therefore, during normal operation within the COLSS power operating limits (POLs), if there are no indications that the actual DNBR margin or LHR has degraded, a power reduction will not significantly improve the level of confidence that the existing margin is below the required margin discussed in Chapter 15 of the Updated Final Safety Analysis Report (UFSAR).

When either TS 3.2.1 or TS 3.2.4 is not satisfied, compensatory actions will provide additional assurance that the actual DNBR margin and LHR do not exceed the safety limits stated in the UFSAR. Compensatory actions will be provided in a revision to the surveillance test procedure for monitoring LHR and DNBR while in the 4-hour ACTION for COLSS out of service. The revised procedure will allow continued full power operation after COLSS becomes unavailable, consistent with the revised TS ACTIONs. In addition, the revised procedure will require LHR and DNBR to be monitored at least every 15 minutes for the 4-hour ACTION period when COLSS is out of service and the more restrictive CPC limits are not met as required by the LHR and DNBR TS LCOs.

The primary consideration in extending the COLSS out-of-service time limit is the remote possibility of a slow, undetectable transient that degrades the DNBR margin or LHR within the 4-hour ACTION time which is then followed by an anticipated operational occurrence or accident. The plant parameters monitored by COLSS which could affect DNBR margin and LHR include RCS flow rate, axial and radial power distribution, cold leg temperature, reactor core power, RCS pressure, and azimuthal tilt. Cold leg temperature, core power, and RCS pressure are monitored by operators using redundant, safety grade control room indications. Operating experience indicates that changes in RCS flow rate are rare and involve only large obvious step changes. Therefore, any change in RCS flow rate will be quickly identified by operators using other redundant, safety-grade instrumentation.

Azimuthal tilt variations occur either slowly over the entire cycle due to burnup variations or due to asymmetric events such as an inadvertent drop or misalignment of a Control Element Assembly (CEA). The probability of dropping or misaligning a CEA is remote, and it is very unlikely that a CEA would drop within a given 4-hour period. In the unlikely event this were to occur, the safety related Control Element Assembly Calculators (CEACs) would alert operators that corrective action was required. A large temperature difference (i.e. an asymmetric steam generator transient) could also produce a core tilt variation but the CPCs have been specifically designed to detect this type of event and ultimately provide the appropriate protection system response. Thus, during the proposed 4-hour ACTION statement any degradation of azimuthal tilt is very unlikely when the plant is operating at steady state conditions and would be quickly and positively identified. Additionally, an adverse change in azimuthal tilt would result in a degradation in the CPC monitored LHR and DNBR margin.

Axial xenon oscillations are a normal consequence of the Palo Verde core designs, particularly near the end of a fuel cycle. The resultant axial core power fluctuations are strictly controlled to ensure efficient and even fuel burnup. As a result, axial power shape is strictly maintained by existing procedures well within the limits assumed in the safety analysis. Typically, one full xenon oscillation will take approximately 26 hours. It is unlikely that a change in axial shape index (ASI) during the 4-hour ACTION period of steady state plant operation would either be undetected or lead to a condition outside the range of initial conditions assumed in the safety analysis since a change would have to be initiated by either a power transient or CEA movement. In the event of an inadvertent power transient or CEA movement, the CPCs would provide the appropriate protection system response. Additionally, any adverse change in ASI would result in a degradation in the CPC monitored LHR and DNBR margin.

The proposed amendment does not modify either the LHR or DNBR LCOs. The core power distribution during all phases of normal operation and anticipated operational occurrences will remain bounded by the initial conditions assumed in Chapter 15 of the UFSAR. The COLSS calculated POLs and the CPC-based LHR and DNBR operating limits will remain unchanged. Increasing the time to 4 hours for restoration of LHR and DNBR to within limits would reduce the number and rate of power reductions. While decreasing the potential for RPS actuation, the proposed change would not significantly increase the probability of exceeding the core power operating limits based on LHR and DNBR. Therefore, this proposed change will not significantly increase the probability or consequences of an accident previously evaluated.

Standard 2 – Create the possibility of a new or different kind of accident from any accident previously evaluated.

The proposed amendment is limited to changing administrative limits and does not involve any physical change to plant systems or to the COLSS and CPC software. These changes will not affect any safety-related equipment used in the mitigation of anticipated operational occurrences or design basis accidents. The only change resulting from this amendment will be to the procedure for operating when COLSS is out of service. The procedural changes will be reviewed and implemented in accordance with 10 CFR 50.59 and TS Administrative Controls. The DNBR and LHR LCOs are not affected by these changes. Therefore, this change will not create the possibility of a new or different kind of accident from any accident previously evaluated.

Standard 3 – Involve a significant reduction in a margin of safety.

TS LCOs 3.2.1 and 3.2.4 ensure that operation of the reactor is within the range of conditions assumed in the Safety Analysis. Therefore, maintaining LHR and DNBR within the existing LCOs will ensure that no anticipated operational occurrence or postulated accident will result in core conditions exceeding Specified Acceptable Fuel Design Limits or the maximum peak cladding temperature of 2200°F specified by 10 CFR 50.46. The UFSAR Chapter 15 analysis remains bounding because there has been no change to the LHR and DNBR limits. Administrative limits will be in place to provide additional assurance that potential reductions in core thermal margin, while in the extended 4-hour ACTION, will be quickly detected, and should it prove necessary, result in a decrease in reactor power and subsequent compliance with the LCOs. Therefore, this change will not result in a significant reduction in a margin of safety.

The NRC staff has reviewed the licensees' analysis and, based on that review, it appears that the three standards of 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment requests involve no significant hazards consideration.

Local Public Document Room location: Phoenix Public Library, 12 East McDowell Road, Phoenix, Arizona 85004

Attorney for licensees: Nancy C. Loftin, Esq., Corporate Secretary and Counsel, Arizona Public Service Company, P.O. Box 53999, Mail Station 9068, Phoenix, Arizona 85072-3999

NRC Project Director: Theodore R. Quay

Carolina Power & Light Company, Docket No. 50-261, H. B. Robinson Steam Electric Plant, Unit No. 2, Darlington County, South Carolina

Date of amendment request: November 20, 1992

Description of amendment request: The proposed amendment would revise the Technical Specifications to add a requirement for a refueling interval calibration of the Auxiliary Feedwater (AFW) flow instrumentation and delete the separate requirement for a refueling interval functional test. A change in the type of instrumentation used to monitor AFW flow resulted in a change in the method of operability verification required. The new instrumentation, installed by a plant modification, can be

calibrated; whereas, the old instrumentation could only be functionally tested.

Basis for proposed no significant hazards consideration determination: As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration, which is presented below:

1. The proposed amendment does not involve a significant increase in the probability or consequences of an accident previously evaluated because the proposed amendment only provides a means of calibration for this equipment. Since the AFW flow indication system provides the operator sufficient information to allow for the recognition and isolation of faulted AFW supply piping to the steam generators, the increase in accuracy and reliability of this indication resulting from its calibration would not involve a significant increase in the probability or consequences of an accident previously evaluated.

2. The proposed amendment does not create the possibility of a new or different kind of accident from any accident previously evaluated.

Since the AFW flow indication system does not interface with any system involved in an accident initiation sequence, the possibility of a new or different kind of accident cannot be created by introduction of a new required calibration of that system. Therefore, the proposed changes do not create the possibility of a new or difference kind of accident from any accident previously evaluated.

3. The proposed amendment does not involve a significant reduction in the margin of safety.

The subject instrumentation calibration has no impact on accident sequences. The improved reliability and accuracy of the subject instrumentation, as a result of its calibration, serve to improve the operator's ability to respond to AFW flow failure events. This potentially improved response to events does not involve a significant reduction in a margin of safety.

The NRC staff has reviewed the licensee's analysis and, based on this review, it appears that the three standards of 10 CFR 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment request involves no significant hazards consideration.

Local Public Document Room location: Hartsville Memorial Library, Home and Fifth Avenues, Hartsville, South Carolina 29550

NRC Project Director: Elinor G. Adensam

Georgia Power Company, Oglethorpe Power Corporation, Municipal Electric Authority of Georgia, City of Dalton, Georgia, Docket Nos. 50-424 and 50-425, Vogtle Electric Generating Plant, Units 1 and 2, Burke County, Georgia

Date of amendment request: May 27, 1992, as supplemented December 7, 1992

Description of amendment request: The proposed amendments would revise Sections 3.0 and 4.0 of the Vogtle Electric Generating Plant Units 1 and 2 Technical Specifications (TS) to incorporate the changes recommended in NRC's Generic Letter 87-09, "Sections 3.0 and 4.0 of the Standard Technical Specifications (STS) on the Applicability of Limiting Conditions for Operation and Surveillance Requirements." In this letter the NRC has concluded that certain recommended modifications to TSs 3.0.4, 4.0.3, and 4.0.4 would clarify the intent of these TSs and would resolve three problems associated with the existing requirements, as follows: (1) TS 3.0.4 would be revised to remove any unnecessary restrictions on operational mode changes in those cases where conformance with Action Statement requirements provides an acceptable level of safety for continued operation for an unlimited period of time; (2) TS 4.0.3 would be revised to provide a 24-hour delay before implementing TS Action Statement requirements due to a missed surveillance, in those cases where the allowed time to perform the missed surveillance is less than 24 hours; and (3) TS 4.0.4 would be revised to assure that its Surveillance Requirements do not prevent the plant's passage through or to Operational Modes as required to comply with TS Action Statement requirements.

Basis for proposed no significant hazards consideration determination: As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration, which is presented below:

1. Revision to Specification 3.0.4 and associated bases

a. The proposed change will not significantly increase the probability or consequences of an accident previously evaluated because the change simply recognizes those cases where conformance to the action requirements associated with an LCO establishes an acceptable level of safety for continued operation of the facility for an unlimited period of time. Generally, individual specifications that have action requirements which allow continued operation note that Specification 3.0.4 does not apply. However, exceptions to Specification 3.0.4 have not been consistently applied. Rather than applying individual exceptions to Specification 3.0.4 (except in those cases where an exception to Specification 3.0.4 exists and the specification does not satisfy the provisions under which mode changes are permitted by the revision to Specification 3.0.4) the revision to Specification 3.0.4 defines the conditions under which the requirements do apply. Furthermore, Georgia Power Company concurs with the NRC staff position that good practice dictates that plant startup should normally be initiated only when all required equipment is operable, and that startup with inoperable equipment must be the exception rather than the rule. Therefore, since the proposed change will ensure consistent application of Specification 3.0.4 while continuing to ensure an acceptable level of safety for continued operation of the facility, the probability or consequences of an accident previously evaluated will not be significantly increased.

b. This change does not create the possibility of a new or different kind of accident from any accident previously evaluated. If an LCO has action requirements that permit continued operation for an unlimited period of time, it follows that an acceptable level of safety is provided by conformance to those action requirements. Therefore, the proposed change does not create the possibility of a new or different kind of accident from any accident previously evaluated.

c. The proposed change will not involve a significant reduction in a margin of safety. As previously stated, the proposed revision to Specification 3.0.4 defines the conditions under which Specification 3.0.4 applies. The fact that the action requirements allow for continued operation of the facility for an unlimited period of time implies that an acceptable level of safety is provided for and maintained by conformance to the action requirements. Therefore, it follows that the proposed change does not involve a significant reduction in a margin of safety.

2. Deletion...of individual exceptions to Specification 3.0.4. Where individual specifications satisfy the provisions of revised Specification 3.0.4 under which mode changes would be allowed, the individual exemption statements have been deleted or added, as necessary. The following specifications and tables are affected by this change:

Specification

3.1.3.2, 3.2.4, 3.3.3.1, 3.3.3.2, 3.3.3.3, 3.3.3.4, 3.3.3.9, 3.3.3.10, 3.3.3.11, 3.4.10, 3.7.1.5, 3.7.9, 3.7.10, 3.8.4.1, 3.9.7, 3.9.9, 3.9.11, 3.9.12, 3.11.1.1, 3.11.1.2, 3.11.1.3, 3.11.1.4, 3.11.2.1, 3.11.2.2, 3.11.2.3, 3.11.2.4, 3.11.2.5, 3.11.2.6, 3.11.3, 3.11.4, 3.12.1, 3.12.2, 3.12.3

Table

3.3-1, 3.3-2, 3.3-8

a. The proposed change will not significantly increase the probability or consequences of an accident previously evaluated. Each specification listed above...presently contains an exception to the provisions of Specification 3.0.4. Georgia Power Company has determined that all...or part of these specifications listed above satisfy the provisions of revised Specification 3.0.4 under which mode changes would be

allowed. In other words, each specification has action requirements which provide an eccepteble level of safety for continued operation of the facility for an unlimited period of time. Therefore, in accordance with Generic Letter 87-09 the individual exceptions to Specifications 3.0.4 are no longer required and should be deleted in order to avoid confusion about the applicability of Specification 3.0.4. The net effect is that there is no change in the requirements. The individual exceptions to Specification 3.0.4 will be replaced by revised Specification 3.0.4. The exception to 3.0.4 is being added to Specificetion 3.7.1.2 to clarify that mode changes are not allowed with three auxiliary feedwater pumps inoperable. Since there is no net change in the requirements, it follows that the proposed change will not significantly increase the probability or consequences of an accident previously eveluated.

b. This change does not create the possibility of a new or different kind of accident from any accident previously evaluated. Since there is no net change in the requirements, it follows that there is no possibility of a new or different kind of accident as a result of this change.

c. The proposed change will not involve a significant reduction in the margin of safety because there is no net change in the requirements.

3. Revision to Specification 4.0.3 and associated bases

a. The proposed chenge will not significantly increase the probability or consequences of an accident previously evaluated. The existing...Technical Specifications state that the ellowable outage time limits apply upon discovery thet a required surveillance has been inadvertently omitted. Therefore, the only change in requirements associated with adopting the wording of Generic Letter 87-09 for Specification 4.0.3 and its essociated bases involves the addition of a 24-hour interval for performing a missed surveillance if the allowable outage time is less than 24 hours.

Generic Letter 87-09 states that it is overly conservative to assume that systems or components are inoperable when a surveillance requirement has not been performed. The letter further states that the majority of surveillances demonstrate that systems or components in fact are operable, and when a surveillance is missed it is primarily a question of verification of operability by the performance of the required surveillance. In some cases, the condition of a missed surveillance could force a plant shutdown which would be unnecessary if in fact the system or component in question was operable. If e plant shutdown is required before a missed surveillance is completed, it is likely that it would be conducted while the plant is being shut down because completion of a missed surveillance could terminate the shutdown requirement. This is undesirable since it increases the risks to the plant and public safety for two reasons. First, the plant would be in a transient state involving changing plant conditions that offer the potential for an upset that could lead to a demand for the system or component being tested. Secondly, a shutdown would increase the pressure on the plant staff to expeditiously complete the required surveillance so that the plant could be returned to power operation. This would further increase the potential for a plant upset when both the shutdown and surveillance activities place a demand on the plant operations. The NRC staff has concluded that, based on consideration of plant conditions, adequete plenning, evallability of personnel, time required to perform the missed surveillance, and the safety significance of the delay in completion of the surveillance, 24 hours would be an acceptable time limit for completing a missed surveillance when the allowable outage time limit is less than 24 hours or when shutdown action requirements apply. Furthermore, the NRC staff concludes that the 24-hour time limit would balance the risks associated with an allowance for completing the surveillance within this period egainst the risks essocieted with the potential for a plant upset and challenge to safety systems when the alternative is a shutdown to comply with action requirements before the surveillance can be completed. Finally, the deletion of the stetement that exceptions to Specification 4.0.3 are noted in individual specifications is an administrative change since the implied exceptions do not exist. Specification 4.0.3 elways epplies.

Georgia Power Company agrees with the evaluation of the NRC steff es presented in Generic Letter 87-09 and therefore concludes that this aspect of the revision to Specification 4.0.3 will not involve a significant increase in the probability or consequences of an accident previously eveluated.

b. This change does not creete the possibility of e new or different kind of accident from any accident previously evaluated. As stated in item 3a above, the proposed revision should minimize the potential for a plant upset due to efforts to comply with an LCO in the event of a missed surveillance. The deletion of the statement regarding noted exceptions to Specification 4.0.3 is an administrative change since the noted exceptions do not exist. Therefore, this change does not create the possibility of a new or different kind of accident.

c. The proposed change does not involve a significant reduction in the margin of safety. Equipment operability will continue to be verified as required by the Technical Specifications. The proposed revision should minimize the potential for plant upset due to efforts to meet an LCO in the event of a missed surveillence. The deletion of the statement regarding noted exceptions to Specification 4.0.3 is administrative since the noted exceptions do not exist. Therefore, this change does not involve a significant reduction in the margin of safety.

4. Revision to Specification 4.0.4 and associated bases

a. The proposed change will not significantly increase the probability or consequences of an accident previously evaluated. As discussed in item 3a, the potential for a plant upset and challenge to safety systems is heightened if surveillances are performed during the transition to shutdown to comply with ection requirements, and it should not apply when mode changes are imposed by action requirements. Since the proposed change should reduce the potential for plant upset and challenge to safety systems, there is no significant increase in the probability or consequences of an accident previously evaluated.

b. The proposed change does not create the possibility of a new or different kind of accident from any accident previously evaluated. As stated in item 4a, this change should reduce the potential for plant upset and chellenge to safety systems. This change is a clarification which will facilitate conformance to action requirements when mode changes are required. Therefore, the chenge does not create the possibility of a new or different kind of accident from any accident previously evaluated.

c. The proposed change does not involve a significant reduction in the margin of safety. The proposed change is a clarification which will facilitate compliance with action requirements when mode changes are required. The result should be an enhancement to plant safety in the event that inoperable equipment or an out of limit condition requires a plant shutdown. Therefore, there is not significant reduction in the margin of safety.

5. Revision of the bases for Specifications 3.0.1, 3.0.2, 3.0.3, 3.0.4, 4.0.1, 4.0.2, 4.0.3, 4.0.4, and 4.0.5

a. The proposed change will not significantly increase the probability or consequences of an eccident previously evaluated because the Technical Specification requirements have not changed (i.e., Specifications 3.0.1, 3.0.2, 3.0.3, 3.0.4, 4.0.1, 4.0.2, 4.0.3, 4.0.4, and 4.0.5). The bases associated with these requirements have simply been rewritten for clarity. Therefore, there will be no significant increase in the probability or consequences of an accident previously evaluated.

b. The proposed change will not create the possibility of a new or different kind of accident from any accident previously evelueted. As stated in item 5a, there are no changes to the requirements proposed. The proposed change will result in improved bases for the subject specifications. Therefore, there is no possibility of a new or different kind of accident from any previously evaluated.

c. The proposed change will not involve a significant reduction in the margin of safety because the requirements have not changed.

The staff has reviewed the licensee's no significant hazards analysis given above. Based on this review and the consistency of the proposed changes with those recommended in Generic Letter 87-09, the staff proposes to determine that the proposed amendments meet the three 10 CFR 50.92(c) standards and do not involve a significant hazards consideration.

Local Public Document Room location: Burke County Public Library, 412 Fourth Street, Waynesboro, Georgia 30830.

Attorney for licensee: Mr. Arthur H. Domby, Troutman, Sanders,

NationsBank Plaza, Suite 5200, 600 Peachtree Street, NE., Atlanta, Georgia 30308-2210.

NRC Project Director: David B. Matthews

Georgia Power Company, Oglethorpe Power Corporation, Municipal Electric Authority of Georgia, City of Dalton, Georgia, Docket Nos. 50-424 and 50-425, Vogtle Electric Generating Plant, Units 1 and 2, Burke County, Georgia

Date of amendment request: December 7, 1992

Description of amendment request: The proposed amendments would revise the Technical Specifications (TS) to change the frequency of reporting the quantity of each of the principal radionuclides released from the plant site to unrestricted areas in liquid and in gaseous effluents from semiannual to annual. These changes would be implemented by further modifying certain related changes (TS Sections 1.19, 6.8.1, and 6.13.2) proposed by the licensee with respect to NRC Generic Letter (GL) 89-19 on March 4, 1992, that were noticed in the **Federal Register** on August 19, 1992 (57 FR 37565). Specifically, the title "Annual Radioactive Effluent Release Report" would be used instead of "Semiannual Radioactive Effluent Release Report." This title appears in TSs 1.19, 6.8.1, 6.13.2, and TS Index page XXIII.

The proposed change for TS 6.8.1 would also require that the Annual Radioactive Effluent Release Report covering the operation of the unit during the previous calendar year be submitted before May 1 of each year, and that the quantity of solid waste releases be reported on an annual, rather than a semiannual, basis.

Basis for proposed no significant hazards consideration determination: As noticed in the **Federal Register** on August 31, 1992 (57 FR 39353), the NRC has amended 10 CFR 50.36a to reduce the required frequency of reporting the quantity of each principal radionuclide released to unrestricted areas in liquid and gaseous effluents from semiannual to annual. The proposed amendments would revise the TS to be consistent with the revised regulation. The reporting requirement for solid wastes is not addressed by the revised 10 CFR 50.36a. However, to be consistent with the proposed changes for liquid and gaseous effluents, the licensee proposes that the quantity of solid waste releases also be reported on an annual basis.

As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration, which is presented below:

1. The proposed changes do not involve a significant increase in the probability or consequences of an accident previously evaluated. The proposed changes are administrative in nature and do not involve any change to the configuration or method of operation of any plant equipment that is used to mitigate the consequences of an accident. Also, the proposed changes do not alter the conditions or assumptions in any of the Final Safety Analysis Report (FSAR) accident analyses. Since the FSAR accident analyses remain bounding, the radiological consequences previously evaluated are not adversely affected by the proposed changes. Therefore, it can be concluded that the proposed changes do not involve a significant increase in the probability or consequences of an accident previously evaluated.

2. The proposed changes do not create the possibility of a new or different kind of accident from any accident previously evaluated. The proposed changes are administrative in nature and do not involve any change to the configuration or method of operation of any plant equipment that is used to mitigate the consequences of an accident. Accordingly, no new failure modes have been defined for any plant system or component important to safety nor has any new limiting failure been identified as a result of the proposed changes. Also, there will be no change in the types or increase in the amount of effluents released offsite. Therefore, it can be concluded that the proposed changes do not create the possibility of a new or different kind of accident from any accident previously evaluated.

3. The proposed changes do not involve a significant reduction in a margin of safety. The proposed changes are administrative in nature and do not adversely impact the plant's ability to meet applicable regulatory requirements related to liquid and gaseous effluents, and solid waste releases. The proposed change[s] would also eliminate an unnecessary burden of governmental regulation without reducing protection for public health and safety. Therefore, it can be concluded that the proposed changes do not involve a significant reduction in a margin of safety.

The NRC staff has reviewed the licensee's analysis and, based on this review, it appears that the three standards of 10 CFR 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment request involves no significant hazards consideration.

Local Public Document Room location: Burke County Public Library, 412 Fourth Street, Waynesboro, Georgia 30830.

Attorney for licensee: Mr. Arthur H. Domby, Esquire, Troutman, Sanders, NationsBank Plaza, Suite 5200, 600 Peachtree Street, NE., Atlanta, Georgia 30308-2210.

NRC Project Director: David B. Matthews

Houston Lighting & Power Company, City Public Service Board of San Antonio,Central Power and Light Company, City of Austin, Texas, Docket Nos. 50-498and 50-499, South Texas Project, Units 1 and 2, Matagorda County, Texas

Date of amendment request: September 28, 1992, as supplemented on November 12, 1992.

Description of amendment request: Two proposed changes to the Technical Specification (TSs) were included in the submittal. The first change is to replace the variable shutdown margin requirements for Modes 1 and 2 with a constant value for all values of boron concentration. The second change is intended to clarify when an overall reactivity balance is to be performed to confirm core design predictions, and hence validate shutdown margin.

Basis for proposed no significant hazards consideration determination: As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration. The NRC staff has reviewed the licensee's analysis against the standards of 10 CFR 50.92(c). The NRC staff's review is presented below.

1. The proposed changes do not involve a significant increase in the probability or consequences of an accident previously evaluated.

Figure 3.1-1 of the TSs presently requires that shutdown margin be maintained as a function of boron concentration for Modes 1, 2, 3, and 4. The shutdown margin is a constant value of 1.75 percent $\Delta k/k$ up to a boron concentration of 900 ppm and then increases linearly with boron concentration. The presence of the variable shutdown requirement for Modes 1 and 2 may place the plant in a condition that is more restrictive than required in order to meet its safety analysis. The use of longer fuel cycles will cause the reactor core to be more reactive at beginning of life (BOL). This, in turn causes the "all rods in" critical boron concentration to increase at BOL. Use of the current Figure 3.1-1 of TS 3.1.1.1 requires additional shutdown margin over the 1.75 percent $\Delta k/k$ for the higher boron concentrations. For Modes 1 and 2, the safety analyses were performed using a constant value of 1.75 percent $\Delta k/k$, so any shutdown margin above that is more than is required to meet the safety analysis.

The licensee is also requesting that the surveillance requirement as stated in TS 4.1.1.1.2 be exempt from the requirements of TS 4.0.4. TS 4.1.1.1.2 requires that "the overall core reactivity balance shall be compared to predicted

values to demonstrate agreement within +1 percent Δk/k at least once per 31 Effective Full Power Days." The TS is applicable in Modes 1, 2, 3, and 4. There is no exemption from TS 4.0.4. TS 4.0.4 prevents a mode change unless all surveillance requirements are met. Therefore, as written, TS 4.1.1.1.2 would have to be satisfied before entry into Mode 4 and each succeeding mode. However, performing a reactivity balance prior to criticality is not possible. As part of a normal reactor startup process, an estimated critical condition (ECC) is performed. If the ECC is in error by a specified amount, plant procedures are followed to ascertain the source of the error and to take appropriate action.

For the above stated reasons, the proposed TS changes do not involve a significant increase in the probability or consequences of an accident previously evaluated.

2. The proposed changes do not create the possibility of a new or different kind of accident from any previously stated.

The design basis for the shutdown margin in Modes 1 and 2 is unchanged.

The proposed change in the applicability of surveillance requirement (TS 4.1.1.1.2) does not affect the accuracy of the parameters used in the shutdown margin calculation performed for compliance with TS 3.1.1.1.

For the above reasons, the proposed changes do not create the possibility of a new or different accident from any previously stated.

3. The proposed changes do not involve a significant reduction in a margin of safety.

The design basis for the shutdown margin in Modes 1 and 2 remains unchanged.

The proposed change in the surveillance requirement does not affect the accuracy of the parameters used in the shutdown margin calculation performed for compliance with TS 3.1.1.1.

For the above reasons, the proposed changes do not involve a significant reduction in the margin of safety.

Based on this review, it appears that the three standards of 10 CFR 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the request for amendments involves no significant hazards consideration.

Attorney for licensee: Jack R. Newman, Esq., Newman & Holtzinger, P.C., 1615 L Street, N.W., Washington, D.C. 20036

NRC Project Director: Suzanne C. Black

Indiana Michigan Power Company, Docket Nos. 50-315 and 50-316, Donald C. Cook Nuclear Plant, Unit Nos. 1 and 2, Berrien County, Michigan

Date of amendment request: February 12, 1992

Description of amendment request: The proposed amendments would change Technical Specifications to reflect the addition of clean water tanks and associated pumps, piping, and valves to the fire suppression water system in Units 1 and 2.

Basis for proposed no significant hazards consideration determination: As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration, which is presented below:

(1) Involve a significant increase in the probability or consequences of an accident previously evaluated.

[The proposed amendment does not involve a significant increase in the probability or consequences of an accident previously evaluated.] The newly installed fire water storage tanks and their three associated pumps will supply enough water and pumping capability to be able to put out the largest single fire hazard even if one of the three pumps fail, which is in accordance with Branch Technical Position APSCB 9.5-1. Maintaining two of the existing pumps that take suction off of Lake Michigan is an added conservatism that results in Cook Nuclear Plant having two completely separate and independent sources of fire suppression water. Consequently, the proposed changes to the Cook Nuclear Plant design and Technical Specifications will not involve a significant increase in the probability or consequences of an accident previously evaluated.

(2) Create the possibility of a new or different kind of accident from any previously analyzed.

[The proposed amendment does not create the possibility of a new or different kind of accident from any previously analyzed.] The proposed system is designed in accordance with 10CFR50 Appendix A General Design Criterion 3. As such, no new potential fire hazards will be located in the vicinity of any structures, systems, or components important to safety. In addition, the effects of the fire water storage tanks rupturing have been analyzed to ensure that the safety capability of structures, systems, or components important to safety is not impaired.

In addition, by having the two pumps that take suction from Lake Michigan, we will still have a readily available source of fire suppression water in the event that the tanks fail. Consequently, the proposed changes will not create the possibility of a new or different kind of accident from any previously analyzed.

(3) Involve a significant reduction in a margin of safety.

[The proposed amendment does not involve a significant reduction in the margin of safety.] The margin of safety was carefully considered in the design of the proposed system. It was realized early in the design process that if we did not maintain the capability to obtain water from [the] Lake Michigan then the overall margin of safety would be reduced for two reasons.

First, Lake Michigan is essentially an infinite source of water and the tanks are not. Second, if both tanks catastrophically failed, no fire suppression water would exist until an alternate source was established.

The number of pumps is also important to the margin of safety. Although only three pumps are needed to meet the requirements of Branch Technical Position APSCB 9.5-1, a reduction in the number of pumps from four in the existing system to three in the new system would also reduce the margin of safety.

However, zebra mussel infestation of the existing system also poses the potential to reduce the margin of safety. Therefore, it was decided to install a new system with clean water stored in tanks and to also maintain two of the existing diesel-engine-driven lake pumps in the new system design. In this manner we address the zebra mussel problem and maintain the capability of obtaining water from Lake Michigan. We also increase the number of pumps from four in the existing system to five in the new system. By keeping the lake pumps isolated we eliminate any concern that the new portion of the system will become infested with zebra mussels. Periodically starting the lake pumps and flushing their discharge piping per the proposed T/Ss requirements, and chemically treating the pumps and discharge piping will help to ensure that they will be kept operational and free of zebra mussels. By increasing the number of pumps, having diversity in our available water sources, and addressing the zebra mussel problem, we have not only addressed the design issues that may have potentially reduced the margin of safety, but have actually increased the margin of safety.

The NRC staff has reviewed the licensee's analysis and, based on this review, it appears that the three standards of 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment request involves no significant hazards consideration.

Local Public Document Room location: Maude Preston Palenske Memorial Library, 500 Market Street, St. Joseph, Michigan 49085.

Attorney for licensee: Gerald Charnoff, Esq., Shaw, Pittman, Potts and Trowbridge, 2300 N Street, NW, Washington, DC 20037.

NRC Project Director: L. B. Marsh.

Niagara Mohawk Power Corporation, Docket No. 50-410, Nine Mile Point Nuclear Station, Unit 2, Oswego County, New York

Date of amendment request: November 24, 1992

Description of amendment request: The proposed amendment would revise Section 6.0, "Administrative Controls," of the Technical Specifications (TS). TS 6.5.1 would be revised to reflect changes in the size and composition of the Station Operations Review Committee (SORC) that are intended to improve the efficiency of the station review function. TS 6.5.3.6 would be revised to change the quorum requirements for the Safety Review and Audit Board (SRAB) to ensure membership continuity during scheduled meetings. TS 6.3 and 6.4 would be revised to delete several references and thereby improve consistency with 10 CFR Part 55.

Basis for proposed no significant hazards consideration determination: As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration, which is presented below:

The operation of NMP2 [Nine Mile Point Nuclear Station, Unit 2], in accordance with the proposed amendment, will not involve a significant increase in the probability or consequences of an accident previously evaluated.

The proposed changes to Technical Specification 6.5.1 are consistent with STS [Standard Technical Specifications] guidelines regarding number of members associated with a "Unit Review Group", designated at NMP2 as the "Station Operations Review Committee (SORC)". Proposed changes to the SORC quorum requirements incorporate BWR [boiling-water reactor] STS guidelines combined with later operating BWR plant provisions regarding establishment of a SORC Vice-Chairman position. The SORC Vice-Chairman position, with duties, responsibilities and qualifications similar to those of the SORC Chairman, is adopted from later operating BWR plant provisions found acceptable to the NRC. In addition, the authority presently granted to the SORC Chairman to appoint alternate SORC members and to convene SORC, is extended to the Vice-Chairman.

These changes provide a flexibility in the implementation of the SORC review process which should enhance the timeliness of response to routine activities as well as to emerging circumstances requiring SORC review. During SORC Chairman absence, the Vice-Chairman position assures the continuity required for effective implementation of the day-to-day SORC functions. Continued technical adequacy of the process is assured by retention of existing procedural controls requiring verification that SORC members or alternates present have appropriate technical background necessary for an adequate safety review of agenda items, as well as the requirements to designate other personnel, as necessary, for attendance at meetings where additional information or expertise is needed.

The SORC function of advising the Plant Manager on all matters related to nuclear safety, as stated in TS 6.5.1.1, remains unchanged. Similarly, the specific SORC responsibilities detailed in TS 6.5.1.6 are not affected by the proposed changes. The number of alternates permitted by TS 6.5.1.3 remains unchanged thereby maintaining the present condition that there always be at least a majority at each SORC meeting who are permanent SORC members.

The proposed change to the SRAB quorum meets the requirements of ANSI [American National Standards Institute] N18.7-1976 Sections 4.3.2.1 and 4.3.2.3. These require that the committee consist of no less than five (5) persons and that the quorum consist of not less than a majority of the principles or duly appointed alternates. This will ensure membership continuity during scheduled meetings. The proposed changes are consistent with STS guidelines, ANSI N18.7-1976 and the SRAB charter.

The proposed changes to TS 6.3 and 6.4 are administrative in nature and since no changes will be made to the Operator and Senior Operator license training programs, there is no impact on nuclear safety.

The proposed changes do not affect any accident precursors and do not alter or modify existing limitations on the function, use of alternates, and responsibilities of the SORC. Addition of STS and later operating BWR plant provisions applicable to NMP2 assures retention of an adequate level and quality of review of matters related to nuclear safety, and therefore does not involve a significant increase in the probability or consequences of an accident previously evaluated.

The operation of NMP2, in accordance with the proposed amendment, will not create the possibility of a new or different kind of accident from any accident previously evaluated.

The proposed changes for NMP2 Technical Specification Section 6.0 are based on STS guidelines and on later operating BWR plant provisions found acceptable to the NRC. These proposed changes have been reviewed for acceptability at NMP2 considering similarity of NMP2 nuclear safety review processes versus the STS and later operating BWRs. No new conditions of operation are introduced by the proposed changes. The proposed changes do not modify existing setpoints or design assumptions for system operation.

Since the proposed changes do not alter the functions and responsibilities of SORC and SRAB to review matters related to nuclear safety, do not modify the present level of plant system operability, and do not affect the Operator and Senior Operator license training programs, the proposed amendment does not create the possibility of a new or different kind of accident from any accident previously evaluated.

The operation of NMP2, in accordance with the proposed amendment, will not involve a significant reduction in a margin of safety.

The proposed changes to Technical Specification Section 6.0 represent a combination of present requirements, STS guidelines and provisions that have been found acceptable for use on other operating BWRs with review processes similar to those at NMP2. The proposed SORC changes are intended to provide the flexibility required for continued timely SORC review of routine activities as well as review of emergent conditions, without compromising the technical adequacy of the process. The proposed SRAB quorum requirements will ensure membership continuity during scheduled SRAB meetings.

Existing procedural administrative controls requiring verification that SORC members or alternates present have appropriate technical background necessary for an adequate safety review of agenda items, as well as the requirements to designate other personnel, as necessary, for attendance at meetings where additional information or expertise is needed, remain in effect.

Since the proposed changes are based on STS guidelines and NRC accepted provisions at other operating plants that are applicable at NMP2, and since procedural administrative controls remain in place to assure presence of adequate technical expertise during the SORC review process, the proposed changes do not involve a significant reduction in a margin of safety.

Therefore, based on the above evaluation, Niagara Mohawk has concluded that these changes do not involve significant hazards consideration.

The NRC staff has reviewed the licensee's analysis and, based on this review, it appears that the three standards of 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment request involves no significant hazards consideration.

NRC Project Director: Robert A. Capra

Northern States Power Company, Docket Nos. 50-282 and 50-306, Prairie Island Nuclear Generating Plant, Unit Nos. 1 and 2, Goodhue County, Minnesota

Date of amendments request: January 21, 1992

Description of amendments request: The amendments revise surveillance tests intervals for engineered safety feature systems pump and valves to be consistent with the standard technical specifications.

Basis for proposed no significant hazards consideration determination: As required by 10 CFR 50.91(a), the

licensee has provided its analysis of the issue of no significant hazards consideration, which is presented below:

1. The proposed amendment will not involve a significant increase in the probability or consequences of an accident previously evaluated.

The decrease in the number of equipment operational transients will increase reliability more than the delay in problem identification. The net effect of this change will have a positive effect on equipment availability. These changes are consistent with Standard Technical Specifications. Therefore, these changes will not effect the probability or consequences of previously analyzed accidents.

2. The proposed amendment will not create the possibility of a new or different kind of accident from any accident previously analyzed.

These changes only affect the equipment testing frequency, and therefore will not create the possibility of a new kind of accident or different kind of accident.

3. The proposed amendment will not involve a significant reduction in the margin of safety.

These changes will improve the performance of equipment and are intended to reduce the potential for equipment failures due to unnecessary testing. No safety margins will be affected.

The NRC staff has reviewed the licensee's analysis and, based on this review, it appears that the three standards of 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment request involves no significant hazards consideration.

Attorney for licensee: Jay Silberg, Esq., Shaw, Pittman, Potts, and Trowbridge, 2300 N Street, NW, Washington, DC 20037.

NRC Project Director: L. B. Marsh

Pacific Gas and Electric Company, Docket Nos. 50-275 and 50-323, Diablo Canyon Nuclear Power Plant, Unit Nos. 1 and 2, San Luis Obispo County, California

Date of amendment requests: October 27, 1992 (Reference LAR 92-06)

Description of amendment requests: The proposed amendment would revise the combined Technical Specifications (TS) for the Diablo Canyon Power Plant (DCPP) Units 1 and 2 to relocate Table 3.8-1, "Motor-Operated Valves (MOVs) Thermal Overload Protection and Bypass Devices," to Diablo Canyon Power Plant procedures. The relocation is proposed in accordance with the guidance provided in Generic Letter (GL) 91-08, "Removal of Component Lists from Technical Specifications," dated May 6, 1991. TS 3/4.8.4 would be revised by removing reference to TS Table 3.8-1 and rewording in accordance with GL 91-08. The associated Bases would also be appropriately revised.

Basis for proposed no significant hazards consideration determination: As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration, which is presented below:

1. Does the change involve a significant increase in the probability or consequences of an accident previously evaluated?

The proposed changes simplify the TS, meet the regulatory requirements for control of MOV thermal overload and bypass devices, and are consistent with the recommendations of NUREG 1024 and GL 91-08. The procedural details of the MOV thermal overload protection and bypass devices table have not been changed, only relocated to a different controlling document. The proposed change is administrative in nature, should result in improved administrative practices, and does not affect plant operations.

Therefore, the proposed changes do not involve a significant increase in the probability or consequences of an accident previously evaluated.

2. Does the change create the possibility of a new or different kind of accident from any accident previously evaluated?

The proposed changes are administrative in nature, do not result in physical alterations or changes to the operation of the plant, and cause no change in the method by which any safety-related system performs its function.

Therefore, the proposed changes do not create the possibility of a new or different kind of accident from any accident previously evaluated.

3. Does the change involve a significant reduction in a margin of safety?

The administrative change to relocate TS Table 3.8-1 to DCPP plant procedures does not alter basic regulatory requirements and does not affect any safety analyses. Adequate control of the content of the table is assured by existing administrative procedures.

The proposed relocation of TS Table 3.8-1 does not alter the requirements for MOV thermal overload protection and bypass devices operability currently in the TS. The LCO and surveillance requirements would be retained in the revised TS. Therefore, the proposed change would not affect the meaning, application, and function of the TS requirements.

Therefore, the proposed change does not involve a significant reduction in a margin of safety.

The NRC staff has reviewed the licensee's analysis and, based on this review, it appears that the three standards of 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment requests involve no significant hazards consideration.

Local Public Document Room location: California Polytechnic State University, Robert E. Kennedy Library, Government Documents and Maps Department, San Luis Obispo, California 93407

Attorney for licensee: Christopher J. Warner, Esq., Pacific Gas and Electric Company, P.O. Box 7442, San Francisco, California 94120

NRC Project Director: Theodore R. Quay

The Cleveland Electric Illuminating Company, Centerior Service Company, Duquesne Light Company, Ohio Edison Company, Pennsylvania Power Company, Toledo Edison Company, Docket No. 50-440, Perry Nuclear Power Plant, Unit No. 1, Lake County, Ohio

Date of amendment request: September 28, 1992

Description of amendment request: The proposed amendment would revise the Technical Specifications by removing the Reactor Protection System (RPS) trip and the Main Steam Line (MSL) Isolation Actuation signal requirements from the Main Steam Line Radiation Monitors (MSLRMs). This Technical Specification (TS) change requires revisions to TS 2.2.1 "Reactor Protection System Instrumentation Setpoints," TS 3.3.1 "Reactor Protection System Instrumentation," and TS 3.3.2 "Isolation Actuation Instrumentation."

Basis for proposed no significant hazards consideration determination: As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration, which is presented below:

1. These changes do not involve a significant increase in the probability or consequences of an accident previously evaluated.

The proposed change does not involve any increase in the probability of a previously evaluated accident. The RPS trips and Main Steam Line isolations being deleted were in place only to react to a previously evaluated accident, the Control Rod Drop Accident (CRDA). The elimination of the trips/isolations will not change the probability of occurrence of the CRDA, and thus has no affect [sic] on the probability of occurrence of previously evaluated accidents.

The consequences of previously evaluated accidents are also not increased as result of the proposed changes. No credit was ever taken for the RPS trip from the Main Steam Line radiation monitors (MSLRMs) in the Control Rod Drop Accident (CRDA) accident sequence description or in the associated radiological assessment (the scram signal assumed in the CRDA is the APRM Upscale signal). At PNPP, the CRDA accident sequence description also does not depend upon the Main Steam Line isolation signals from the MSLRMs. The plant will continue to be operated in compliance with the Banked Position Withdrawal Sequence (BPWS) analysis criteria, which are unchanged by this proposed amendment.

These criteria are enforced by the Rod Pattern Controller portion of the Rod Pattern Control System (RPCS), whose design and Technical Specification controls are also unchanged by this amendment, and conformance to the BPWS criteria ensure that an individual control rod's worth is such that if it is dropped during rod withdrawals, the enthalpy rise will continue to be less than the acceptance criteria for such scenarios. A CRDA event would not result in any significant radiological release, and the magnitude of any such release would continue to be less than any level which would have caused an isolation signal from the MSLRMs. As noted in the Bases for Specification 3.1.4.2, during power reductions below the LPSP [Low Power Setpoint], the Rod Pattern Controller portion of RPCS provides automatic supervision to assure that out-of-sequence rods will not be withdrawn or inserted. If this condition is not correctable in a manner consistent with the BPWS analysis, controls are in place to scram the plant. If the Rod Pattern Controller portion of RPCS is inoperable when thermal power is below the Low Power Setpoint, Technical Specification 3.1.4.2, Rod Pattern Control System, requires that no control rod be moved except by scram. Therefore, enforcement of the BPWS/RPCS requirements assures that the CRDA is of no significance at PNPP, and that the Main Steam Line isolation signal from the MSLRMs is not required.

Even though the BPWS/RPCS is designed to minimize the consequences of the CRDA, a hypothetical radiological assessment of a CRDA was performed which assumed that the BPWS/RPCS and their corresponding requirements do not exist in order to evaluate the radiological consequences without subsequent main steam line isolation, as compared to previous design basis assessments. This assessment was performed consistent with the BWR Owners Group Topical Report NEDO-31400 "Safety Evaluation for Eliminating the Boiling Water Reactor Main Steam Line Isolation Valve Closure Function and Scram Function of the Main Steam Line Radiation Monitor," which has been reviewed and generically accepted by the NRC staff in a Safety Evaluation Report (SER) dated May 15, 1991.

The NEDO-31400 submittal and the NRC's SER analyzed the proposed changes and both concluded that as long as the individual utilities met certain conditions the changes would not significantly affect the consequences of a previously evaluated accident. This amendment request documents how PNPP meets the conditions imposed by the NRC's SER, and that the PNPP design is in fact bounded by the NEDO-31400 radiological analysis. Thus this assessment also shows that there is no significant increase in the consequences of any previously evaluated accident.

2 The proposed changes do not create the possibility of a new or different kind of accident from any previously evaluated.

The proposed changes request the removal of the Technical Specification requirements for the RPS trips and main steam line isolation signals generated by the MSLRMs. The original reason for the signals was to respond to a CRDA as discussed above. The elimination of these signals, which served only in a mitigative function, do not create the possibility of a new or different kind of accident from those previously evaluated. Also, radiation monitors with alarm functions will remain installed in the plant to warn the operators of a high radiation condition in the main steam lines, or in the offgas system. In addition, the trip signal from the MSLRMs to the mechanical vacuum pump line isolation valves will remain installed in the plant, and will be addressed in the Technical Specifications. As such, the condenser release path through the mechanical vacuum pump line will still be isolated on a high Main Steam Line Radiation condition. Thus no new or different accident can be postulated by the proposed changes.

3. The proposed changes do not involve a significant reduction in the margin of safety.

A reliability assessment of the elimination of the MSLRM scram function on reactivity control failure frequency and core damage frequency was performed as part of the NEDO analysis. The results of the analysis indicated a negligible increase in reactivity control failure frequency with deletion of the MSLRM scram function. However, this increase is offset by the reduction in the transient initiating events (inadvertent scrams). This reduction in transient initiating events represents a reduction in core damage frequency. The final result was determined to be a net improvement to safety.

The NRC staff has reviewed the licensee's analysis and, based on this review, it appears that the three standards of 10 CFR 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment request involves no significant hazards consideration.

Local Public Document Room location: Perry Public Library, 3753 Main Street, Perry, Ohio 44081

Attorney for licensee: Jay Silberg, Esq., Shaw, Pittman, Potts & Trowbridge, 2300 N Street, NW., Washington, DC 20037

NRC Project Director: John N. Hannon

Toledo Edison Company, Centerior Service Company, and The Cleveland Electric Illuminating Company, Docket No. 50-346, Davis-Besse Nuclear Power Station, Unit No. 1, Ottawa County, Ohio

Date of amendment request: July 28, 1992

Description of amendment request: The proposed amendment wouldddelete Technical Specification (TS) 3/4.9.9, "Refueling Operations - Containment Purge and Exhaust Isolation System," and its bases, because of its redundancy to other TS that address the operability requirements of the containment purge and exhaust isolation system. Also, the proposed amendment would revise TS 3/4.3.2, "Safety System Instrumentation - Safety Features Actuation System Instrumentation," and TS 3/4.9.4, "Refueling Operations - Containment Penetrations," and its bases. The effect of this proposed change would be to allow the bypass of the safety features actuation system in Mode 6, "Refueling," by the use of the containment purge and exhaust system noble gas monitor in conjunction with manual closure of the containment purge and exhaust isolation valves instead of automatic closure.

Basis for proposed no significant hazards consideration determination: As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration, which is presented below:

Toledo Edison had reviewed the proposed changes and determined that a significant hazards consideration does not exist because operation of the DBNPS in accordance with the changes would:

1a. Not involve a significant increase in the probability of an accident previously evaluated because the initiators regarding the fuel handling accident (USAR Section 15.4.7.3) are not affected by the deletion of TS 3/4.9.9 or the use of the containment purge and exhaust system noble gas monitor (RE5052C) to automatically contain any release in progress.

1b. Not involve a significant increase in the consequences of an accident previously evaluated because the assumptions discussed in the fuel handling accident (USAR Section 15.4.7.3) are not affected by the deletion of TS 3/4.9.9 or allowing the use of the containment purge and exhaust system noble gas monitor (RE5052C) to automatically contain a release in progress. Furthermore, manual operator action can be taken to isolate containment in lieu of the SFAS area radiation monitors' automatic containment isolation function. No credit is taken in the assumptions for the containment isolation. Thus, the deletion of TS 3/4.9.9 and the use of the containment purge and exhaust system noble gas monitor (RE5052C) and manual operator action does not involve a significant increase in the consequences of an accident previously evaluated. There is no significant change in the ability of DBNPS to contain a release of radioactivity.

2b. Not create the possibility of a different kind of accident from any accident previously evaluated because the operability requirements of the containment purge and exhaust isolation system contained in the TS 3/4.9.9 are adequately addressed by SR 4.3.2, SR 4.6.3, and TS 3/4.9.4. Thus, deletion of TS 3/4.9.9 does not affect the operability of the containment purge and exhaust isolation system and, therefore, does not create the possibility of a different kind of accident from any accident previously evaluated.

Allowing the use of the containment purge and exhaust system noble gas monitor (RE5052C) to automatically contain a release in progress in lieu of the SFAS area radiation monitors' automatic containment isolation function does not introduce any different accident initiators. Furthermore, manual

operator action can be taken to isolate containment. Thus, it does not create the possibility of a different kind of accident from any accident previously evaluated.

3. Not involve a significant reduction in a margin of safety because neither the purpose nor the function of the containment purge and exhaust isolation system is being changed by the deletion of TS 3/4.9.9. The operability requirements of TS 3/4.9.9 are adequately addressed in SR 4.3.2, SR 4.6.3, and TS 3/4.9.4.

Allowing the use of the containment purge and exhaust system noble gas monitor (RE5052C) to automatically contain a release in progress in lieu of the SFAS area radiation monitors automatic isolation function is acceptable based on the accident analysis assuming no isolation or filtration for the fuel handling accident in containment. Furthermore, manual operator action can be taken to isolate containment. Thus, it does not involve a significant reduction in a margin of safety.

The NRC staff has reviewed the licensee's analysis and, based on this review, it appears that the three standards of 10 CFR 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment request involves no significant hazards consideration.

Toledo Edison Company, Centerior Service Company, and The Cleveland Electric Illuminating Company, Docket No. 50-346, Davis-Besse Nuclear Power Station, Unit No. 1, Ottawa County, Ohio

Date of amendment request: September 11, 1992

Description of amendment request: The proposed amendment would delete Technical Specification (TS) Figures 5.1-1, 5.1-2, 5.1-3, and 5.1-4 regarding the Davis-Besse Nuclear Power Station exclusion area, low population zone, unrestricted area boundary for liquid effluents, and unrestricted area boundary for gaseous effluents, respectively. Also, TS 5.1, "Site," would be revised to reference 10 CFR Part 100, "Reactor Site Criteria," and TS Section 1.0, "Definitions," instead of the four figures.

Basis for proposed no significant hazards consideration determination: As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration, which is presented below:

Toledo Edison has reviewed the proposed changes and determined that a significant hazards consideration does not exist because operation of the Davis-Besse Nuclear Power Station, Unit Number 1, in accordance with the proposed changes would:

1a. Not involve a significant increase in the probability of an accident previously evaluated because this is strictly an administrative change to delete from the Davis-Besse Nuclear Power Station (DBNPS) Technical Specifications (TS) information that is already maintained in the DBNPS Updated Safety Analysis Report (USAR). There are no accident initiators or assumptions affected by the proposed changes.

1b. Not involve a significant increase in the consequences of an accident previously evaluated because this is strictly an administrative change to delete from the DBNPS TS information that is already maintained in the DBNPS USAR. There is no effect on the source term or containment isolation, and no increase in radiological effluents.

2a. Not create the possibility of a new kind of accident from any accident previously evaluated because this is strictly an administrative change to delete from the DBNPS TS information that is already maintained in the DBNPS USAR.

2b. Not create the possibility of a different kind of accident from any accident previously evaluated because this is strictly an administrative change to delete from the DBNPS TS information that is already maintained in the DBNPS USAR.

3. Not involve a significant reduction in a margin of safety because this is strictly an administrative change to delete from the DBNPS TS information that is already maintained in the DBNPS USAR.

The NRC staff has reviewed the licensee's analysis and, based on this review, it appears that the three standards of 10 CFR 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment request involves no significant hazards consideration.

Local Public Document Room location: University of Toledo Library, Documents Department, 2801 Bancroft Avenue, Toledo, Ohio 43606

Attorney for licensee: Jay E. Silberg, Esquire, Shaw, Pittman, Potts and Trowbridge, 2300 N Street, N.W., Washington, DC 20037

NRC Project Director: John N. Hannon

Union Electric Company, Docket No. 50-483, Callaway Plant, Unit 1, Callaway County, Missouri

Date of amendment request: November 3, 1992 and December 1, 1992

Description of amendment request: This proposed amendment would revise Technical Specification (TS) 3.3.2 "Engineered Safety Features Actuation System (ESFAS) Instrumentation," TS 3.8.1 "Alternating Current (AC) Sources," and their associated surveiliances. These TS revisions would require the Load Shedder Emergency Load Sequencer (LSELS) and the supplying 4KV Bus undervoltage devices to be operable during plant modes 5 and 6.

Basis for proposed no significant hazards consideration determination: As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration, which is presented below:

The proposed change does not involve a significant hazards consideration because operation of Callaway Plant with this change would not:

1. Involve a significant increase in the probability or consequences of an accident previously evaluated. The Callaway Safety Analysis Report has been reviewed and been found to be unaffected by this proposed change. This change will not increase the probability or consequences of any accident or malfunction of equipment because the LSELS will be required to be operable in modes 5 and 6 which enhances plant operabilily

2. Create the possibility of a new or different kind of accident from any previously evaluated. This change increases the operability requirement for the LSELS. There is no new type of accident or malfunction created and the method and manner of plant operation will only change by adding OPERABILITY requirements for LSELS in MODES 5 & 6, which enhances plant safety in shutdown modes.

3. Involve a significant reduction in a margin of safety. The margin of safety remains unaffected since no design change is made and plant operation remains the same.

As discussed above, the proposed change does not involve a significant increase in the probability or consequences of an accident previously evaluated or create the possibility of a new or different kind of accident from any previously evaluated. This change does not result in a significant reduction in a margin of safety. Therefore, it has been determined that the proposed change does not involve a significant hazards consideration.

The NRC staff has reviewed the licensee's analysis and, based on this review, it appears that the three standards of 10 CFR 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment request involves no significant hazards consideration.

Local Public Document Room location: Callaway County Public Library, 710 Court Street, Fulton, Missouri 65251.

Attorney for licensee: Gerald Charnoff, Esq., Shaw, Pittman, Potts & Trowbridge, 2300 N Street, N.W., Washington, DC 20037

NRC Project Director: John N. Hannon

Union Electric Company, Docket No. 50-483, Callaway Plant, Unit 1, Callaway County, Missouri

Date of amendment request: November 3, 1992 and December 4, 1992

Description of amendment request: This proposed amendment would revise Table 4.3-1 "Reactor Trip System Instrumentation Surveillance Requirements," Note 5, to reflect that integral bias curves, rather than detector plateau curves, are used to calibrate the source range instrumentation. The low-noise preamplifiers, provided for the Callaway Nuclear Instrumentation System, do not accommodate the use of the traditional detector plateau curves to calibrate the source range.

The integral bias curve is considered to be a more inclusive calibration than the detector plateau curves. The intermediate range and power range channels will continue to be calibrated by using the detector plateau curves.

Basis for proposed no significant hazards consideration determination: As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration, which is presented below:

The proposed change to Technical Specification Table [4.3-1] does not involve a significant hazard consideration because operation of the Callaway Plant with this change would not:

1. Involve a significant increase in the probability or consequences of an accident previously evaluated.

Plant equipment is not modified by calibrating the NIS [Nuclear Instrumentation System] source range instrumentation using the integral bias curve. Using the integral bias curve is a more inclusive calibration than the plateau curve and provides the same information, i.e., the high voltage operating point. The change does not affect accident initiators or assumptions. The consequences due to accidents previously evaluated are not being changed.

2. Create the possibility of a new or different kind of accident from any previously evaluated.

No new accidents are created by the changes being made. No new equipment is being added. No new modes of operation or means of control are being made. The probability of a malfunction of equipment important to safety is unchanged since the calibration of the NIS source range instrumentation using the integral bias curve, rather than the plateau curve, provides the same information. The consequences of malfunctions of equipment important to safety are not changed. No new malfunctions are being created. No new controlling modes or equipment operations are being created.

3. Involve a significant reduction in a margin of safety.

Using the integral bias curve is a more inclusive calibration than the plateau curve and provides the same information, i.e., the high voltage operating point. As discussed above, the proposed change does not involve a significant increase in the probability or consequences of an accident previously evaluated, create the possibility of a new or different kind of accident from any previously evaluated, or result in a significant reduction in a margin of safety. Therefore, it has been determined that the proposed change does not involve a significant hazards consideration.

The NRC staff has reviewed the licensee's analysis and, based on this review, it appears that the three standards of 10 CFR 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment request involves no significant hazards consideration.

Local Public Document Room location: Callaway County Public Library, 710 Court Street, Fulton, Missouri 65251.

Attorney for licensee: Gerald Charnoff, Esq., Shaw, Pittman, Potts & Trowbridge, 2300 N Street, N.W., Washington, DC 20037

NRC Project Director: John N. Hannon

Washington Public Power Supply System, Docket No. 50-397, Nuclear Project No. 2, Benton County, Washington

Date of amendment request: November 25, 1992

Description of amendment request: The amendment proposes to change Section 6 (Administrative Controls) of the Technical Specifications (TS) to: (1) modify the title of the Nuclear Safety Assurance Group (NSAG) to the Nuclear Safety Assurance Division (NSAD), and Director of Licensing and Assurance to Director of Quality Assurance, (2) modify the titles of the members on the Plant Operations Committee (POC), (3) delete the position of Assistant Plant Manager as Vice Chairman of the POC, and allow the Plant Manager to designate a Vice Chairman from the POC membership, and record the designation in the POC meeting minutes, and (4) add the Engineering Services Division Manager as a POC member. One title change involves splitting the current combined responsibilities for Chemistry/Radiation Protection into two different management positions responsible for their respective activities. The Radiation Protection Manager will remain as a member of the POC.

The proposed changes are needed to implement a reorganization of plant management to make the various divisions of station operation more responsive to plant issues and events.

Basis for proposed no significant hazards consideration determination: As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration. The NRC staff has reviewed the licensee's analysis against the standards of 10 CFR 50.92(c). The NRC staff's review is presented below.

The changes are administrative in nature and involve no physical alteration of the plant, or changes to setpoints, operating conditions, or operating parameters. The response of the plant to previously evaluated accidents thus is not affected. Therefore, the proposed change will not involve a significant increase in the probability or consequences of an accident previously evaluated.

The administrative nature of the proposed changes do not affect the design, operation, maintenance, or testing of the plant. Thus no new modes of failure are created. Therefore, these changes do not create the possibility of a new or different kind of accident from any accident previously evaluated.

The proposed changes reflect a planned organizational change that do not change the qualification requirements or competence of the members of the POC. The same technical level of Plant Management Staff is still required to constitute a quorum. The addition of the Engineering Services Division Manager to POC membership expands the capability to more completely cover appropriate aspects of station operation. Thus, the capability of POC to meet its responsibilities is not diminished. Therefore, these changes do not involve a significant reduction in a margin to safety.

Based on this review, it appears that the three standards of 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment request involves no significant hazards consideration.

Local Public Document Room location: Richland Public Library, 955 Northgate Street, Richland, Washington 99352

Attorney for licensee: Nicholas S. Reynolds, Esq., Winston & Strawn, 1400 L Street, N.W., Washington, D.C. 20005-3502

NRC Project Director: Theodore R. Quay

Wolf Creek Nuclear Operating Corporation, Docket No. 50-482, Wolf CreekGenerating Station, Coffey County, Kansas

Date of amendment request: October 28, 1992

Description of amendment request: The proposed technical specification revisions are being made to various parameter values, limiting conditions

for operation, and surveillance requirements as a result of analyses performed to support Cycle 7 operation, including the introduction of the VANTAGE 5H fuel design. Although the analyses were also performed assuming an increased power level, the proposed Cycle 7 changes do not include an increase in the rated thermal power defined by the facility operating license. Specific changes proposed include the incorporation of a Core Operating Limits Report in accordance with Generic Letter 88-16, increases in allowable peaking factors, changes to power distribution monitoring to reflect a change to the licensee's nuclear design methodology, increase in the most positive moderator temperature coefficient, changes to several reactor protection system setpoints, decrease in the reactor coolant system thermal design flow, increase in the allowable tolerance on the main steam safety valve setpoints, and an increase in the required shutdown margin in Mode 5, Cold Shutdown.

Basis for proposed no significant hazards consideration determination: As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration. The NRC staff has reviewed the licensee's analysis against the standards of 10 CFR 50.92(c). The NRC staff's review is presented below.

1. Do the proposed changes involve a significant increase in the probability or consequences of an accident previously evaluated.

The proposed changes do not significantly change the actual operation of plant systems, structures or components. The changes in fuel assembly design, power distribution monitoring, and reactivity parameter values have been evaluated and determined to be acceptable. These changes have been analyzed in accordance with methodologies which have been approved by or are currently under review by the NRC staff. Since the changes do not significantly revise plant hardware or operating practices, no increase in the probability of an accident has been introduced. The changes, including those involving changes in setpoints, setpoint tolerances, or other analysis assumptions have been analyzed and determined to have minimal impact on the consequences of any previously evaluated accident.

2. Do the proposed changes create the possibility of a new or different kind of accident from any previously evaluated.

The proposed changes do not introduce any significant changes to the performance requirements for or mode of operation of any systems or components and therefore, do not introduce any new failure modes. Changes to specific parameter values or tolerances have been analyzed utilizing methodologies either approved by or currently under review by the NRC and the plant has been determined to remain within established operating limits. Therefore, there is no possibility of the creation of a new or different kind of accident from those previously evaluated.

3. Do the proposed changes involve a significant reduction in the margin of safety.

The analyses performed to justify Cycle 7 operation, including all of the proposed changes, demonstrated that applicable design and safety limits continue to be satisfied. The proposed changes to various parameter values, limiting conditions for operation, and surveillance requirements reflect changes in the core design methodology and selected analysis assumptions. However, the analyses methodologies utilized have either been approved or are currently under review by the NRC. These reviews and the specific analysis results associated with the proposed changes have demonstrated that the margin of safety is not significantly reduced.

Previously Published Notices Of Consideration Of Issuance Of Amendments To Operating Licenses, Proposed No Significant Hazards Consideration Determination, And Opportunity For A Hearing

The following notices were previously published as separate individual notices. The notice content was the same as above. They were published as individual notices either because time did not allow the Commission to wait for this biweekly notice or because the action involved exigent circumstances. They are repeated here because the biweekly notice lists all amendments issued or proposed to be issued involving no significant hazards consideration.

For details, see the individual notice in the **Federal Register** on the day and page cited. This notice does not extend the notice period of the original notice.

Pennsylvania Power and Light Company, Docket No. 50-387 Susquehanna Steam Electric Station, Unit 1, Luzerne County, Pennsylvania

Date of amendment request: November 30, 1992

Brief description of amendment request: The amendment would revise the Technical Specifications to authorize operation of the Reactor Water Cleanup (RWCU) system in the current fuel cycle (Cycle 6) with the RWCU system non-regenerative heat exchanger discharge high temperature channel substituting for the inoperable 'B' RWCU high flow isolation trip channel.Date of publication of individual notice in **Federal Register:** December 15, 1992, (57 FR 59363)

Expiration date of individual notice: January 14, 1993

Local Public Document Room location: Osterhout Free Library, Reference Department, 71 South Franklin Street, Wilkes-Barre, Pennsylvania 18701.Notice Of Issuance Of Amendment To Facility Operating License

During the period since publication of the last biweekly notice, the Commission has issued the following amendments. The Commission has determined for each of these amendments that the application complies with the standards and requirements of the Atomic Energy Act of 1954, as amended (the Act), and the Commission's rules and regulations. The Commission has made appropriate findings as required by the Act and the Commission's rules and regulations in 10 CFR Chapter I, which are set forth in the license amendment.

Notice of Consideration of Issuance of Amendment to Facility Operating License, Proposed No Significant Hazards Consideration Determination, and Opportunity for Hearing in connection with these actions was published in the **Federal Register** as indicated. No request for a hearing or petition for leave to intervene was filed following this notice.

Unless otherwise indicated, the Commission has determined that these amendments satisfy the criteria for categorical exclusion in accordance with 10 CFR 51.22. Therefore, pursuant to 10 CFR 51.22(b), no environmental impact statement or environmental assessment need be prepared for these amendments. If the Commission has prepared an environmental assessment under the special circumstances provision in 10 CFR 51.12(b) and has

made a determination based on that assessment, it is so indicated.

For further details with respect to the action see (1) the applications for amendments, (2) the amendments, and (3) the Commission's related letters, Safety Evaluations and/or Environmental Assessments as indicated. All of these items are available for public inspection at the Commission's Public Document Room, the Gelman Building, 2120 L Street, NW., Washington, D.C., and at the local public document rooms for the particular facilities involved. A copy of items (2) and (3) may be obtained upon request addressed to the U.S. Nuclear Regulatory Commission, Washington, DC 20555, Attention: Director, Division of Reactor Projects.

Baltimore Gas and Electric Company, Docket Nos. 50-317 and 50-318, Cliffs Nuclear Power Plant, Unit Nos. 1 and 2, Calvert County, Maryland

Date of application for amendments: September 1, 1992, as supplemented on November 11, 1992.

Brief description of amendments: The amendments revise the Unit Nos. 1 and 2 spent fuel pool enrichment limit. The enrichment limit is decreased from 5.0 weight percent (w/o) U-235 to a value of 4.52 w/o U-235.

Date of issuance: December 22, 1992
Effective date: December 22, 1992
Amendment Nos.: 176 and 153
Facility Operating License Nos. DPR-53 and DPR-69: Amendments revised the Technical Specifications.

Date of initial notice in **Federal Register:** September 30, 1992 (57 FR 45075)The Commission's related evaluation of these amendments is contained in a Safety Evaluation dated December 22, 1992. No significant hazards consideration comments received: No

Local Public Document Room location: Calvert County Library, Prince Frederick, Maryland 20678.

Boston Edison Company, Docket No. 50-293, Pilgrim Nuclear Power Station,Plymouth County, Massachusetts

Date of application for amendment: October 8, 1992

Brief description of amendment: This amendment revises Technical Specifications to incorporate an asterisk referencing a footnote granting relief to allow only one train of SGTS and CRHEAF system operable prior to and during refueling activities during RFO No. 9.

Date of issuance. December 16, 1992
Effective date: December 16, 1992
Amendment No.: 144

Facility Operating License No. DPR-35: Amendment revised the Technical Specifications.

Date of initial notice in **Federal Register:** October 28, 1992 (57 FR 48813) The Commission's related evaluation of the amendment is contained in a Safety Evaluation dated December 16, 1992. No significant hazards consideration comments received: No

Local Public Document Room location: Plymouth Public Library, 11 North Street, Plymouth, Massachusetts 02360.

Carolina Power & Light Company, Docket No. 50-261, H. B. Robinson SteamElectric Plant, Unit No. 2, Darlington County, South Carolina

Date of application for amendment: June 5, 1992

Brief description of amendment: The amendment clarifies Item 44 of Technical Specification Table 4.1-1, which specifies the minimum frequencies for checks, calibrations and tests of the containment vessel high-range monitors (R-32A and B) by revising the footnote so that the calibration method is clearly identified as an acceptable alternative to the NRC-preferred calibration technique described in NUREG-0737, but which does not preclude the use of the NUREG-0737 methodology.

Date of issuance: December 10, 1992
Effective date: December 10, 1992
Amendment No. 143
Facility Operating License No. DPR-23. Amendment revises the Technical Specifications.

Date of initial notice in **Federal Register:** June 24, 1992 (57 FR 28196) The Commission's related evaluation of the amendment is contained in a Safety Evaluation dated December 10, 1992. No significant hazards consideration comments received: No

Local Public Document Room location: Hartsville Memorial Library, Home and Fifth Avenues, Hartsville, South Carolina 29550

Consumers Power Company, Docket No. 50-255, Palisades Plant, Van Buren County, Michigan

Date of application for amendment: October 13, 1989 and August 27, 1992.

Brief description of amendment: This amendment would modify the Palisades Plant Technical Specification (TS) Section to incorporate the guidance provided in NRC Generic Letter (GL) 89-01 for implementation of programmatic controls for Radiological Effluent Technical Specifications (RETS) in the Administrative Controls Section of the TS and the relocation of procedural details of RETS to the Offsite Dose Calculation Manual (ODCM) or to the Process Control Program (PCP). This amendment also changes the reporting requirement for major modifications to radioactive liquid, gaseous, and solid waste treatment systems from a special report to a 10 CFR 50.59 report.

Date of issuance: December 18, 1992
Effective date: December 18, 1992
Amendment No.: 154
Facility Operating License No. DPR-20. Amendment revises the Technical Specifications.

Date of initial notice in **Federal Register:** February 7, 1990 (55 FR 4262)The Commission's related evaluation of the amendment is contained in a Safety Evaluation dated December 18, 1992. No significant hazards consideration comments received: No.

Local Public Document Room location: Van Wylen Library, Hope College, Holland, Michigan 49423.

Entergy Operations, Inc., Docket No. 50-368, Arkansas Nuclear One,Unit No. 2, Pope County, Arkansas

Date of application for amendment: October 15, 1991

Brief description of amendment: The amendment deleted two inboard containment purge isolation valves from Technical Specification Table 3.6-1.

Date of issuance: December 14, 1992
Effective date: December 14, 1992
Amendment No.: 140
Facility Operating License No. NPF-6. Amendment revised the Technical Specifications.

Date of initial notice in **Federal Register:** September 2, 1992 (57 FR 40211)The Commission's related evaluation of the amendment is contained in a Safety Evaluation dated December 14, 1992. No significant hazards consideration comments received: No.

Local Public Document Room location: Tomlinson Library, Arkansas Tech University, Russellville, Arkansas 72801

Entergy Operations, Inc., Docket No. 50-368, Arkansas Nuclear One,Unit No. 2, Pope County, Arkansas

Date of application for amendment: October 9, 1990, as supplemented by letters dated May 12, and September 28, 1992

Brief description of amendment: The amendment revised TS 3/4.8.1, "A.C. Sources," to achieve consistency with Generic Letter 84-15, "Proposed Staff Actions to Improve and Maintain Diesel Generator Reliability." The changes were intended to reduce testing of the emergency diesel generators and

improve their reliability. Editorial changes were also made.

Date of issuance: December 15, 1992

Effective date: 30 days from the date of issuance

Amendment No.: 141

Facility Operating License No. NPF-6. Amendment revised the Technical Specifications.

Date of initial notice in **Federal Register:** November 28, 1990 (55 FR 494500). The additional information contained in the supplemental letters dated May 12, and September 28, 1992, was clarifying in nature and, thus, within the scope of the initial notice and did not affect the staff's proposed no significant hazards consideration determination.The Commission's related evaluation of the amendment is contained in a Safety Evaluation dated December 15, 1992. No significant hazards consideration comments received: No.

Local Public Document Room location: Tomlinson Library, Arkansas Tech University, Russellville, Arkansas 72801

Houston Lighting & Power Company, City Public Service Board of San Antonio, Central Power and Light Company, City of Austin, Texas, Docket Nos. 50-498 and 50-499, South Texas Project, Units 1 and 2, Matagorda County, Texas

Date of amendment request: June 26, 1991, as supplemented by letters dated January 24, 1992 and June 24, 1992.

Brief description of amendments: The amendments make changes to the Technical Specifications in accordance with the guidance provided in Generic Letter 89-01. The changes consist of relocating the procedural details of Radiological Effluent Technical Specifications (RETS) into the Offsite Dose Calculation Manual (ODCM) or the Process Control Program (PCP) in a manner that ensures these details are incorporated into plant operating procedures. In addition, programmatic controls would be added to the Administrative Controls section of Technical Specifications to satisfy the regulatory requirements and control changes to the procedural details of ODCM or PCP.

Date of issuance: December 21, 1992

Effective date: December 21, 1992, to be implemented within 15 days of issuance.

Amendment Nos.: Amendment Nos. 47 and 36

Facility Operating License Nos. NPF-76 and NPF-80: Amendment revised the Technical Specifications.

Date of initial notice in **Federal Register:** September 18, 1991 and September 30, 1992 (56 FR 47238 and 57 FR 45085). The Commission'srelated evaluation of the amendments is contained in a Safety Evaluation dated December 21, 1992. No significant hazards consideration comments received: No.

Local Public Document Room location: Wharton County Junior College, J. M. Hodges Learning Center, 911 Boling Highway, Wharton, Texas 77488

Indiana Michigan Power Company, Docket Nos. 50-315 and 50-316, Donald C. Cook Nuclear Plant, Unit Nos. 1 and 2, Berrien County, Michigan

Date of application for amendments: February 15, 1991 as supplemented September 13, 1991.

Brief description of amendments: The amendments make administrative changes to the TS for both units. Four items in the proposed change were not purely administrative in nature. The changes dealt with operability of the automatic trip logic, engineered safety featured system instrumentation, containment air lock, and the physical stops on the Auxiliary Building Crane. These changes will be evaluated under a separate cover.

Date of issuance: November 13, 1992

Effective date: November 13, 1992

Amendments Nos.: 168 and 151Facility Operating Licenses Nos. DPR-58 and DPR-74. Amendments revised theTechnical Specifications.

Date of initial notice in **Federal Register:** July 10, 1991 (56 FR 31435) and November 13, 1991 (56 FR 57697).The Commission's related evaluation of the amendments is contained in a Safety Evaluation dated November 13, 1992. No significant hazards consideration comments received: No.

Local Public Document Room location: Maude Preston Palenske Memorial Library, 500 Market Street, St. Joseph, Michigan 49085.

Nebraska Public Power District, Docket No. 50-298, Cooper Nuclear Station, Nemaha County, Nebraska

Date of amendment request: November 15, 1991

Brief description of amendment: The amendment modified the technical specifications to remove the Rod Sequence Control System, and reduce the Rod Worth Minimizer Low Power Setpoint from 20 percent to 10 percent.

Date of issuance: December 22, 1992

Effective date: December 22, 1992

Amendment No.: 156

Facility Operating License No. DPR-46 Amendment revised the Technical Specifications.

Date of initial notice in **Federal Register:** July 8, 1992 (57 FR 30251)The Commission's related evaluation of the amendment is contained in a Safety Evaluation dated December 22, 1992. No significant hazards consideration comments received: No.

Local Public Document Room location: Auburn Public Library, 118 15th Street, Auburn, Nebraska 68305.

Niagara Mohawk Power Corporation, Docket No. 50-220, Nine Mile Point Nuclear Station Unit No. 1, Oswego County, New York

Date of application for amendment: October 16, 1992

Brief description of amendment: The amendment revises Technical Specification Surveillance Requirement 4.1.4.b. to extend the current quarterly pump surveillance test interval for Core Spray System 11 from January 10, 1993, until February 20, 1993.

Date of issuance: December 17, 1992

Effective date: December 17, 1992

Amendment No.: 135

Facility Operating License No. DPR-63: Amendment revises the Technical Specifications.

Date of initial notice in **Federal Register:** November 12, 1992 (57 FR 53787)The Commission's related evaluation of the amendment is contained in a Safety Evaluation dated December 17, 1992. No significant hazards consideration comments received: No

Local Public Document Room location: Reference and Documents Department, Penfield Library, State University of New York, Oswego, New York 13126.

Niagara Mohawk Power Corporation, Docket No. 50-220, Nine Mile Point Nuclear Station Unit No. 1, Oswego County, New York

Date of application for amendment: September 17, 1992

Brief description of amendment: The amendment revises Technical Specification 3.6.12/4.6.12, "Reactor Protection System Motor Generator Set Monitoring," and associated Bases to reflect the replacement of Motor Generator Sets 162 and 172 with Static Uninterruptible Power Supplies. The amendment also makes conforming changes to the Table of Contents and a minor editorial change to Technical Specification 4.6.12.

Date of issuance: December 17, 1992

Effective date: December 17, 1992

Amendment No.: 136

Facility Operating License No. DPR-63: Amendment revises the Technical Specifications.

Date of initial notice in **Federal Register:** October 14, 1992 (57 FR

47140)The Commission's related evaluation of the amendment is contained in a Safety Evaluation dated December 17, 1992. No significant hazards consideration comments received: No

Local Public Document Room location: Reference and Documents Department, Penfield Library, State University of New York, Oswego, New York 13126.

Northeast Nuclear Energy Company, et al., Docket No. 50-336, Millstone Nuclear Power Station, Unit No. 2, New London County, Connecticut

Date of application for amendment: August 5, 1992, as supplemented October 20, 1992

Brief description of amendment: The amendment incorporates into the Technical Specifications the addition of two containment isolation valves to the auxiliary feedwater system and changes to Technical Specification Table 3.6-2, "Containment Isolation Valves."

Date of issuance: December 14, 1992

Effective date: December 14, 1992

Amendment No.: 166

Facility Operating License No. DPR-65. Amendment revised the Technical Specifications.

Date of initial notice in **Federal Register:** September 2, 1992 (57 FR 40216) The October 20, 1992, submittal provided additional clarifying information that did not change the initial no significant hazards consideration determination. The Commission's related evaluation of the amendment is contained in a Safety Evaluation dated December 14, 1992. No significant hazards consideration comments received: No.

Local Public Document Room location: Learning Resources Center, Thames Valley State Technical College, 574 New London Turnpike, Norwich, Connecticut 06360.

Northern States Power Company, Docket Nos. 50-282 and 50-306, Prairie Island Nuclear Generating Plant, Unit Nos. 1 and 2, Goodhue County, Minnesota

Date of application for amendments: March 20, 1992 as revised July 23 and November 6, 1992. The July 23 and November 6, 1992 letters contained clarifying information to the amendment application. This information did not change the scope of the amendment request or the proposed determination of no significant hazards consideration.

Brief description of amendments: The amendments add and revise limiting conditions for operation and surveillance requirements to reflect the facility station blackout project modifications that will be complete upon startup of the Prairie Island units from the Fall 1992 outages.

Date of issuance: December 17, 1992

Effective date: December 17, 1992

Amendment Nos.: 103 and 96

Facility Operating License Nos. DPR-42 and DPR-60. Amendment revised the Technical Specifications.

Date of initial notice in **Federal Register:** April 15, 1992 (57 FR 13135) The Commission's related evaluation of the amendment is contained in a Safety Evaluation dated December 17, 1992. No significant hazards consideration comments received: No.

Power Authority of the State of New York, Docket No. 50-333, James A. FitzPatrick Nuclear Power Plant, Oswego County, New York

Date of application for amendment: November 20, 1992

Brief description of amendment: The amendment revises Technical Specification (TS) 3.0.D and its associated Bases to incorporate recommendations of NRC Generic Letter (GL) 87-09, "Sections 3 0 And 4.0 Of The Standard Technical Specifications (STS) On The Applicability Of Limiting Conditions For Operation And Surveillance Requirements." Specifically, GL 87-09 provides guidance to address unnecessary restrictions on mode changes by TS 3.0.4 (FitzPatrick TS 3.0.D) and inconsistent application of exceptions.

Date of issuance: December 17, 1992

Effective date: December 17, 1992

Amendment No.: 184

Facility Operating License No. DPR-59: Amendment revised the Technical Specifications.Public comments requested as to proposed no significant hazards consideration: Yes (57 FR 56430, dated November 27, 1992). That notice provided an opportunity to submit comments on the Commission's proposed no significant hazards consideration determination. No comments have been received. The notice published November 27, 1992, also provided for an opportunity to request a hearing by December 28, 1992, but indicated that if the Commission makes a final no significant hazards consideration determination any such hearing would take place after issuance of the amendment.

The Commission's related evaluation of the amendment, finding of exigent circumstances, and final no significant hazards consideration determination are contained in a Safety Evaluation dated December 17, 1992.

Local Public Document Room location: Reference and Documents Department, Penfield Library, State University of New York, Oswego, New York 13126.

Public Service Electric & Gas Company, Docket No. 50-354, Hope Creek Generating Station, Salem County, New Jersey

Date of application for amendment: June 4, 1992 and July 8, 1992, as supplemented by letters dated September 1, 1992, October 6, 1992, and November 16, 1992.

Brief description of amendment: This amendment changes Technical Specification 6.3 to delete the Operations Manager as a position requiring a Senior Reactor Operator (SRO) license and delineate the requirements for the Operations Manager position, and changes TS 6.3.1 and 6.4.1 to delete existing licensed operator qualification and training requirements that are superseded based on 1) INPO accreditation of Hope Creek's licensed operator training programs, and 2) promulgation of the revised 10 CFR Part 55.

Date of issuance: December 21, 1992

For the Nuclear Regulatory Commission

Martin J. Virgilio,

Acting Director, Division of Reactor Projects III/IV/V, Office of Nuclear Reactor Regulation

[Doc. 93–44 Filed 1–5–93; 8:45 am]

BILLING CODE 7590–01–F

[Docket No. 50–373]

Commonwealth Edison Co.; Notice of Consideration of Issuance of Amendment to Facility Operating License, Proposed No Significant Hazards Consideration Determination, and Opportunity for Hearing

The U.S. Nuclear Regulatory Commission (the Commission) is considering issuance of an amendment to Facility Operating License No. NPF–11, issued to Commonwealth Edison Company (CECo, the licensee), for operation of the LaSalle County Station, Unit 1, located in LaSalle County, Illinois.

The proposed amendment requests changes to Technical Specification 5.0.

"Design Features" to address the planned rerack of the spent fuel pool at the LaSalle County Station. The proposed rerack would increase the spent fuel pool storage capacity from 1080 to 3986 storage cells. The added capacity would extend the projected loss of the full core discharge capability date from 2002 to 2013.

Before issuance of the proposed license amendment, the Commission will have made findings required by the Atomic Energy Act of 1954, as amended (the Act) and the Commission's regulations.

The Commission has made a proposed determination that the amendment request involves no significant hazards consideration. Under the Commission's regulations in 10 CFR 50.92, this means that operation of the facility in accordance with the proposed amendment would not (1) involve a significant increase in the probability or consequences of an accident previously evaluated; or (2) create the possibility of a new or different kind of accident from any accident previously evaluated; or (3) involve a significant reduction in a margin of safety. As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration, which is presented below:

(1) Would operation of the facility in accordance with the proposed amendment involve a significant increase in the probability or consequences of an accident previously evaluated?

In the course of the analysis, CECo has considered the following potential accident scenarios:

1. A fuel assembly drop in the spent fuel pool.
2. Tool drops from the elevated worktable.
3. Loss of spent fuel pool cooling system flow.
4. A seismic event.
5. Rack (heavy load) drop during [rack installation].

It has been concluded that the proposed modification to the spent fuel pool does not increase the probability of accident scenarios 1–4 since the increase in storage capacity is not assumed to be an initiator of events involving the loss of spent fuel pool cooling, a dropped spent fuel assembly in the spent fuel pool, or a seismic event. A tool drop from the elevated worktable, although not a previously analyzed accident, is bounded by the consequences of the fuel drop accident.

CECo has also considered the probability of an accident resulting from a postulated rack (heavy load) drop during the [installation] process. LaSalle Technical Specification 3.9.7.b. restricts movement of loads heavier than the weight of a single spent fuel assembly from being carried over fuel stored in the spent fuel pool. All work in the spent fuel pool area will be controlled and performed in strict accordance with specific written procedures and administrative controls to prevent the movement of a rack directly over any fuel, all of which will be stored in the Unit 2 Spent Fuel Storage Pool. Therefore the probability of an accident resulting from the drop of a rack module on spent fuel is [very low].

* * * * *

Accordingly, the proposed Technical Specification and the associated modification does not involve an increase in the probability of an accident previously evaluated, or an accident of a different type.

CECo has evaluated the consequences of a fuel assembly drop in the spent fuel pool and determined that the criticality acceptance criterion, $k_{eff} \leq 0.95$, is not violated. In addition, CECo determined that the radiological consequences of a fuel assembly drop are bounded by the [Updated Final Safety Analysis Report] UFSAR analyses. Analyses demonstrate that the calculated doses are well within 10 CFR part 100 guidelines. The results of an analysis show that a dropped fuel assembly on the racks will not distort the racks such that stored fuel assemblies would be impacted. Thus, the consequences of this type of accident are not significantly changed from the previously evaluated spent fuel assembly drops.

The spent fuel pool system is a passive system with the exception of the Fuel Pool Cooling and Cleanup system and HVAC equipment. The redundancies in the cooling system and the HVAC hardware are not reduced by the planned storage densification. The extent of active hardware in these systems is only marginally changed. Therefore, the probability of occurrence or malfunction of safety equipment leading to loss of spent fuel pool cooling flow is not increased.

The consequences of a loss of spent fuel pool cooling system flow have been evaluated and it was determined that sufficient time remains available to provide an alternate means for cooling in the event of a complete failure of the cooling system. Thus, the consequences of this type of accident are not increased from previously evaluated loss of cooling system flow accidents.

The consequences of a seismic event have been evaluated. The new racks are designed and will be fabricated to meet the requirements of applicable portions of the NRC Regulatory Guides and published standards. The new free-standing racks are designed so that the integrity of both the racks and the pool structure is maintained during and after a seismic event with no resultant damage to stored fuel. Thus, the consequences of a seismic event are not increased from previously evaluated events.

The probability and consequences of a spent fuel cask drop will not be affected by the replacement of the racks. LaSalle Technical Specification 3.9.7. restricts movement of spent fuel casks from traveling over any region of the spent fuel pool. During the reracking of the Unit 1 Spent Fuel Storage Pool, all spent fuel will be stored in the Unit 2 Spent Fuel Storage Pool.

The consequences of a rack (heavy load) drop during [installation] have been considered. There is no equipment which is essential to the safe shutdown of the reactor or employed to mitigate the consequences of an accident which is beneath, adjacent to or otherwise within the area of influence of any loads that will be handled during the expansion modification. An analysis was also performed to determine the effect on the integrity of the spent fuel pool structure following the free fall of the heaviest rack module. The analysis concluded that the maximum load due to the rack drop event is well below the cumulative impact load produced during the seismic event, and as such is bounded by the seismic analysis. Therefore, the consequences of a rack (heavy load) drop during construction are not increased from previously evaluated events.

In summary, it is concluded that the proposed amendment to replace the spent fuel racks in the Unit 1 spent fuel pool does not involve an increase in the probability or consequences of an accident previously evaluated.

(2) Would operation of the facility in accordance with the proposed amendment create the possibility of a new or different kind of accident from any accident previously evaluated?

CECo has evaluated the proposed modification in accordance with the guidance of the NRC Position Paper, "OT Position for Review and Acceptance of Spent Fuel Storage and Handling Applications," appropriate NRC Regulatory Guides, appropriate NRC Standard Review Plans, and appropriate Industry codes and standards. In addition, CECo has reviewed several previous NRC Safety Evaluation Reports for rerack applications similar to this proposed modification.

No unproven technology will be utilized either in the construction process or in the analytical techniques necessary to justify the planned fuel storage expansion. The basic reracking technology in this instance has been developed and demonstrated in other applications for fuel pool capacity increases previously approved by the NRC.

Based upon the foregoing, CECo concludes that the proposed Technical Specification and associated reracking modification does not create the possibility of a new or different kind of accident from any accident previously evaluated.

(3) Would operation of the facility in accordance with the proposed amendment involved a significant reduction in the margin of safety?

* * * * *

The established acceptance criterion for criticality is that the neutron multiplication factor in spent fuel pools shall be less than or equal to 0.95, including all uncertainties, under all conditions. This margin of safety has been adhered to in the criticality analysis methods for the new rack design.

The methods used in the criticality analysis conform to the applicable portions of the appropriate NRC guidance and industry codes, standards, and specifications. In meeting the acceptance criteria for criticality in the spent fuel pool, the analyses showed that k_{eff} is always less than 0.95, including uncertainties at a 95% confidence and 95% probability. Therefore, the proposed amendment does not involve a reduction in the margin of safety for nuclear criticality, as defined in the UFSAR.

The K-infinity criticality approach for allowing storage of advanced fuel designs in the new Unit 1 fuel racks includes the same type of conservatisms that were used in the original analysis performed for the new spent fuel storage racks. Therefore, the use of the K-infinity analysis does not involve a reduction in the margin of safety for nuclear criticality.

Conservative methods were used to calculate the maximum fuel cladding temperature and the increase in temperature of the water in the spent fuel pool. The thermal-hydraulic evaluation used the methods previously employed for evaluations of previously licensed high density spent fuel racks to demonstrate that adequate temperature margin is maintained. The proposed modification will increase the heat load in the spent fuel pool. However, the evaluation shows that the existing spent fuel cooling system will maintain the bulk pool water temperature at or below 140 degrees Fahrenheit with both cooling trains in operation. Thus, it is demonstrated that the peak value of the pool bulk temperature is lower than the temperature guidelines for both normal and abnormal conditions specified in the Standard Review Plan, section 9.1.3. The evaluation also shows that maximum local water temperatures along the hottest fuel assembly are below the nucleate boiling condition value. Thus, there is no reduction in the margin of safety for thermal hydraulic or spent fuel cooling concerns as defined in the UFSAR.

The main safety function of the spent fuel pool and the racks is to maintain the spent fuel assemblies in a safe configuration through all normal or abnormal loadings. Abnormal loadings which have been considered are the effect of an earthquake and the impact due to the drop of a spent fuel assembly. The mechanical, material, and structural design of the new spent fuel racks is in accordance with applicable portions of "NRC OT Position for Review and Acceptance of Spent Fuel Storage and Handling Applications," dated April 14, 1978, as modified January 18, 1979 and other applicable NRC guidance and industry codes. The rack materials used are comparable with the spent fuel pool and spent fuel assemblies. The structural considerations of the new racks address margins of safety against tilting and deflection or movement, such that the racks, if they do impact each other during the postulated seismic events, will only come in contact with each other at locations designed for that purpose. In addition the spent fuel assemblies remain intact and no criticality concerns exist. Thus the margins of safety as defined in the UFSAR are not reduced by the proposed rerack.

The Finite Element Method was used to evaluate the margins of the spent fuel pool concrete structure. The evaluation demonstrates that the strength margin of safety of the fuel pool structure is maintained.

From the foregoing, it is concluded that the margin of safety against nuclear criticality, structural integrity and material compatibility are consistent with the provision of the LaSalle UFSAR and USNRC regulations. The new worse case maximum bulk pool water temperature is 140 degrees Fahrenheit. This is found to result in a negligible decrease in the time-to-boil stated in the UFSAR. The margin of safety in the pool structure due to thermal loadings is well within the UFSAR specifications.

The NRC staff has reviewed the licensee's analysis and, based on this review, it appears that the three standards of 10 CFR 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment request involves no significant hazards consideration.

The Commission is seeking public comments on this proposed determination. Any comments received within thirty (30) days after the date of publication of this notice will be considered in making any final determination. The Commission will not normally make a final determination unless it receives a request for a hearing.

Written comments may be submitted by mail to the Rules and Directives Review Branch, Division of Freedom of Information and Publications Services, Office of Administration, U.S. Nuclear Regulatory Commission, Washington, DC 20555, and should cite the publication date and page number of this **Federal Register** notice. Written comments may also be delivered to Room P–223, Phillips Building, 7920 Norfolk Avenue, Bethesda, Maryland, from 7:30 a.m. to 4:15 p.m. Federal workdays. Copies of written comments received may be examined at the NRC Public Document Room, the Gelman Building, 2120 L Street, NW., Washington, DC 20555. The filing of requests for hearing and petitions for leave to intervene is discussed below.

By February 5, 1993, the licensee may file a request for a hearing with respect to issuance of the amendment to the subject facility operating license and any person whose interest may be affected by this proceeding and who wishes to participate as a party in the proceeding must file a written request for a hearing and a petition for leave to intervene. Requests for a hearing and a petition for leave to intervene shall be filed in accordance with the Commission's "Rules of Practice for Domestic Licensing Proceedings" in 10 CFR part 2. Interested persons should consult a current copy of 10 CFR 2.714 which is available at the Commission's Public Document Room, the Gelman Building, 2120 L Street, NW., Washington, DC 20555 and at the local public document room located at the Public Library of Illinois Valley Community College, Rural Route No. 1, Oglesby, Illinois 61348.

If a request for a hearing or petition for leave to intervene is filed by the above date, the Commission or an Atomic Safety and Licensing Board Panel, designated by the Commission or by the Chairman of the Atomic Safety and Licensing Board Panel, will rule on the request and/or petition; and the Secretary or the designated Atomic Safety and Licensing Board Panel will issue a notice of hearing or an appropriate order.

As required by 10 CFR 2.714, a petition for leave to intervene shall set forth with particularity the interest of the petitioner in the proceeding, and how that interest may be affected by the results of the proceeding. The petition should specifically explain the reasons why intervention should be permitted with particular reference to the following factors: (1) The nature of the petitioner's right under the Act to be made a party to the proceeding; (2) the nature and extent of the petitioner's property, financial, or other interest in the proceeding; and (3) the possible effect of any order which may be entered in the proceeding on the petitioner's interest. The petition should also identify the specific aspect(s) of the subject matter of the proceeding as to which petitioner wishes to intervene. Any person who has filed a petition for leave to intervene or who has been admitted as a party may amend the petition without requesting leave of the Board up to fifteen (15) days prior to the first prehearing conference scheduled in the proceeding, but such an amended petition must satisfy the specificity requirements described above.

Not later than fifteen (15) days prior to the first prehearing conference scheduled in the proceeding, a petitioner shall file a supplement to the petition to intervene which must include a list of the contentions which are sought to be litigated in the matter. Each contention must consist of a specific statement of the issue of law or fact to be raised or controverted. In addition, the petitioner shall provide a brief explanation of the bases of the contention and a concise statement of the alleged facts or expert opinion which support the contention and on which the petitioner intends to rely in proving the contention at the hearing. The petitioner must also provide references to those specific sources and documents of which the petitioner is aware and on which the petitioner intends to rely to establish those facts or expert opinion. Petitioner must provide sufficient information to show that a genuine dispute exists with the applicant on a material issue of law or fact. Contentions shall be limited to matters within the scope of the amendment under consideration. The

contention must be one which, if proven, would entitle the petitioner to relief. A petitioner who fails to file such a supplement which satisfies these requirements with respect to at least one contention will not be permitted to participate as a party.

Those permitted to intervene become parties to the proceeding, subject to any limitations in the order granting leave to intervene, and have the opportunity to participate fully in the conduct of the hearing, including the opportunity to present evidence and cross-examine witnesses.

If a hearing is requested, the Commission will make a final determination on the issue of no significant hazards consideration. The final determination will serve to decide when the hearing is held.

If the final determination is that the amendment request involves no significant hazards consideration, the Commission may issue the amendment and make it immediately effective, notwithstanding the request for a hearing. Any hearing held would take place after issuance of the amendment.

If the final determination is that the amendment request involves a significant hazards consideration, any hearing held would take place before the issuance of any amendment.

Normally, the Commission will not issue the amendment until the expiration of the 30-day notice period. However, should circumstances change during the notice period, such that failure to act in a timely way would result, for example, in derating or shutdown of the facility, the Commission may issue the license amendment before the expiration of the 30-day notice period, provided that its final determination is that the amendment involves no significant hazards consideration. The final determination will consider all public and State comments received. Should the Commission take this action, it will publish in the **Federal Register** a notice of issuance and provide for opportunity for a hearing after issuance. The Commission expects that the need to take this action will occur very infrequently.

A request for a hearing or a petition for leave to intervene must be filed with the Secretary of the Commission, U.S. Nuclear Regulatory Commission, Washington, DC 20555, Attention: Docketing and Services Branch, or may be delivered to the Commission's Public Document Room, the Gelman Building, 2120 L Street, NW., Washington, DC 20555, by the above date. Where petitions are filed during the last ten (10) days of the notice period, it is requested that the petitioner promptly so inform the Commission by a toll-free telephone call to Western Union at 1–(800)–325–6000 (in Missouri 1–(800)–342–6700). The Western Union operator should be given Datagram Identification Number N1023 and the following message addressed to Richard J. Barrett: petitioner's name and telephone number; date petition was mailed; plant name; and publication date and page number of this **Federal Register** notice. A copy of the petition should also be sent to the Office of the General Counsel, U.S. Nuclear Regulatory Commission, Washington, DC 20555, and to Michael I. Miller, Esquire; Sidley and Austin, One First National Plaza, Chicago, Illinois 60690, attorney for the licensee.

Nontimely filings of petitions for leave to intervene, amended petitions, supplemental petitions and/or requests for hearing will not be entertained absent a determination by the Commission, the presiding officer or the presiding Atomic Safety and Licensing Board Panel that the petition and/or request should be granted based upon a balancing of the factors specified in 10 CFR 2.714(a)(1) (i)–(v) and 2.714(d).

The Commission hereby provides notice that this is a proceeding on an application for a license amendment falling within the scope of section 134 of the Nuclear Waste Policy Act of 1982 (NWPA), 42 U.S.C. 10154. Under section 134 of the NWPA, the Commission, at the request of any party to the proceeding, must use hybrid hearing procedures with respect to "any matter which the Commission determines to be in controversy among the parties." The hybrid procedures in section 134 provide for oral argument on matters in controversy, preceded by discovery under the Commission's rules, and the designation, following argument, of only those factual issues that involve a genuine and substantial dispute, together with any remaining questions of law, to be resolved in an adjudicatory hearing. Actual adjudicatory hearings are to be held on only those issues found to meet the criteria of section 134 and set for hearing after oral argument.

The Commission's rules implementing section 134 of the NWPA are found in 10 CFR part 2, Subpart K, "Hybrid Hearing Procedures for Expansion of Spent Nuclear Fuel Storage Capacity at Civilian Nuclear Power Reactors" (published at 50 FR 41670, October 15, 1985), and 10 CFR 2.1101 *et seq.* Under those rules, any party to the proceeding may invoke the hybrid hearing procedures by filing with the presiding officer a written request for oral argument under 10 CFR 2.1109. To be timely, the request must be filed within 10 days of an order granting a request for hearing or petition to intervene. (As outlined above, the Commission's rules in 10 CFR part 2, subpart G, and 2.714 in particular, continue to govern the filing of requests for a hearing or petitions to intervene, as well as the admission of contentions.) The presiding officer shall grant a timely request for oral argument. The presiding officer may grant an untimely request for oral argument only upon showing of good cause by the requesting party for the failure to file on time and after providing the other parties an opportunity to respond to the untimely request. If the presiding officer grants a request for oral argument, any hearing held on the application shall be conducted in accordance with the hybrid hearing procedures. In essence, those procedures limit the time available for discovery and require that an oral argument be held to determine whether any contentions must be resolved in adjudicatory hearing. If no party to the proceedings requests oral argument, or if all untimely requests for oral argument are denied, then the usual procedures in 10 CFR part 2, subpart G, apply.

For further details with respect to this action, see the application for amendment dated June 5, 1992, which is available for public inspection at the Commission's Public Document Room, the Gelman Building, 2120 L Street, NW., Washington, DC 20555, and at the local public document room, located at the Public Library of Illinois Valley Community College, Rural Route No. 1, Oglesby, Illinois 61348.

Dated at Rockville, Maryland, this 29th day of December 1992.

For the Nuclear Regulatory Commission.

Robert J. Stransky,

Project Manager, Project Directorate III–2, Division of Reactor Projects—III/IV/V, Office of Nuclear Reactor Regulation.

AGENCY: U.S. Office of Special Counsel.

ACTION: Extension of the expiration date of a currently approved collection.

Information Collection Submitted to the Office of Management and Budget for Review Under the Paperwork Reduction Act.

SUMMARY: The U.S. Office of Special Counsel has submitted the following proposal for the collection of information to the Office of Management and Budget for approval under provisions of the Paperwork Reduction Act (44 U.S.C. chapter 35).

OMB APPROVAL NUMBER: 3255–0002.

SUPPLEMENTARY INFORMATION: To fulfill the requirements of 5 U.S.C. 1212(a) of the Whistleblower Protection Act of 1989, the Office of Special Counsel (OSC) must receive complaints of prohibited personnel practices, Hatch Act violations and other matters under the Special Counsel's jurisdiction; whistleblower disclosures must also be received.

Affected Public

Individuals and Federal, State, and local government employees.

Respondent's Obligations

Required to obtain or retain a benefit.

Frequency

One time per complaint or disclosure.

Estimated Completion Time

1 hour.

Annual Responses

1600.

FOR FURTHER INFORMATION CONTACT: Copies of the information collection proposal can be obtained by calling or writing Cathleen M. Sadlo, (202) 653–6005, U.S. Office of Special Counsel, 1730 M Street, NW., suite 300, Washington, DC 20036–4505. Written comments and recommendations for the proposed information collection should be sent to Ms. Sadlo and Joe Lackey, OMB Desk Officer, Office of Management and Budget, room 3002, 725 17th Street, NW., Washington, DC 20503.

Signed on this 30th day of December, 1992.

Leonard M. Dribinsky,

Deputy Associate Special Counsel for Prosecution.

BILLING CODE 7405–01–M

OFFICE OF THE UNITED STATES TRADE REPRESENTATIVE

[Docket No. 301–90]

Determination Concerning Section 301 Investigation of Indonesian Acts, Policies, and Practices Regarding Pencil Slat

AGENCY: Office of the United States Trade Representative.

ACTION: Notice of determination pursuant to section 304(a) of the Trade Act of 1974, as amended (Trade Act), that acts, policies, and practices of Indonesia concerning pencil slat are not imposing a burden or restriction upon United States commerce within the meaning of section 301(b)(1) of the Trade Act. In light of this determination, the United States Trade Representative (USTR) has terminated this investigation.

SUMMARY: On October 2, 1992, pursuant to section 302(a) of the Trade Act, the USTR initiated an investigation of Indonesia's acts, policies, and practices concerning pencil slat, in response to a petition filed by P&M Cedar Products, Inc. and Hudson ICS. 57 FR 46609 (Oct. 9, 1992). Since the investigation was initiated, the interagency Section 301 Committee has reviewed information submitted by the petitioners, the Government of Indonesia, and interested persons, as well as information already in the United States's possession and obtained from public sources. Additionally, in coordination with the Section 301 Committee, an interagency team led by USTR officials has conducted three rounds of consultations with Indonesian Government officials concerning the allegations set forth in the petition.

Based upon the results of these investigative efforts and the recommendations of the Section 301 Committee, the USTR has determined pursuant to sections 301(b)(1) and 304(a) of the Trade Act that the alleged acts, policies and practices are not imposing a burden or restriction upon United States commerce. Accordingly, the USTR has terminated this investigation.

EFFECTIVE DATE: This investigation is terminated effective December 31, 1992.

ADDRESSES: Office of the United States Trade Representative, 600 17th Street, NW., Washington, DC 20506.

FOR FURTHER INFORMATION CONTACT: Peter Collins, Director, Southeast Asian Affairs (202) 395–6813; Joseph Papovich, Deputy Assistant United States Trade Representative for Industry and Labor (202) 395–6160; or Dorothy Balaban, Special Assistant to the Section 301 Committee (202) 395–3432, Office of the United States Trade Representative.

SUPPLEMENTARY INFORMATION:

Summary of the Investigation

On August 18, 1992, P&M Cedar Products, Inc. and Hudson ICS filed a petition pursuant to section 302(a) of the Trade Act alleging that various Indonesian practices concerning pencil slat are unreasonable and burden or restrict United States commerce. Petitioners manufacture pencil slat from incense cedar. Indonesian pencil slat is manufactured from Jelutong, a less expensive and lower quality product.

The petition alleges that the following practices by Indonesia enhance exports of Indonesian pencil slat to third-country markets and are actionable under section 301(b): (1) The imposition of differential export taxes, with a high tax imposed on logs and no tax imposed on finished products such as pencil slat; (2) underpricing of government-owned timber stock; and (3) failure to enforce the terms of timber concession arrangements. The petition contends that these actions are part of Indonesia's plan to target exports of wood products, including pencil slat, a practice which is actionable under section 301(d)(3)(E) of the Trade Act. According to the petition, the combined effect of these practices has resulted in a substantial decline in petitioner' sales in third-country markets.

On October 2, 1992, the USTR initiated an investigation to determine whether the petition's allegations warranted action pursuant to section 301. 57 FR 46609 (Oct. 9, 1992). Immediately thereafter, USTR requested consultations with the Government of Indonesia, as required by section 303(a) of the Trade Act. Additionally, USTR invited comments from interested persons, 57 FR 46609–10, and obtained information and advice from the petitioners in preparing for the consultations. USTR also considered documents already in the possession of the United States concerning the possibility that Indonesia has engaged in or tolerated anticompetitive activities involving wood products.

In coordination with the Section 301 Committee, an interagency team led by USTR officials conducted three rounds of consultations with Indonesian government officials. Two of these rounds were held in Jakarta. On November 15 and 16, 1992, senior USTR officials and the Section 301 Committee met with petitioners and their counsel to discuss the petition's allegations, Indonesia's responses, submissions by interested persons, data gathered during the investigation, and legal and policy issues raised by the petition. The Section 301 Committee and the interagency investigative team also reviewed all available information concerning the practices alleged by the petition, including all comments submitted by interested persons and information obtained from international organizations.

Results of the Investigation

1. Indonesia's Log Export Tax

The investigation revealed that Indonesia maintains high export taxes on virtually all unprocessed and semi-processed wood products. The export tax on Jelutong logs is US$500 per cubic meter, and the export tax on Jelutong lumber is US$250 per cubic meter. The petition alleges that these export taxes "artificially inflate the domestic supply of materials used to make pencil slat, and thus depress their prices within Indonesia. Indonesian pencil slat producers thus obtain far cheaper raw materials."

No evidence was submitted to or uncovered by USTR or the Section 301 Committee during the investigation substantiating that the export tax has resulted in lower prices for Jelutong logs and lumber. In fact, as explained below, the data shows just the opposite—that Indonesian prices for Jelutong logs and lumber have increased notwithstanding the export tax.

2. Pricing of Government-Owned Timber

The petition also alleges that "Indonesia deliberately undervalues its forests, thereby reducing the cost of logging to artificially low levels," and that this undervaluation is evidenced by Indonesia's capture of only one-third of the actual economic "rent" on government-owned timber. Further, the petition claims that, because of extensive vertical integration in this industry, the benefits of any undervaluation flow directly to pencil slat producers. According to the petition, Indonesia captures less rent than the Malaysian state of Sabah. While Sabah captures over three-quarters of its timber rent, Indonesia captures only one-third.

Data obtained during the investigation demonstrates, however, that Indonesia's capture of rent compares favorably with that of a number of other similarly-situated, major timber producing states. These include the Malaysian state of Sarawak, Peninsular Malaysia, and the Philippines, which capture only 18.4 percent, 21.8 percent, and 11 percent, respectfully. This information indicates that Indonesia captures timber rent at a rate comparable to other similarly-situated countries.

3. Enforcement of Terms of Timber Concessions

The petition alleges that Indonesia charges "fire sale" prices for its timber and "turns a blind eye to widespread and notorious smuggling, poaching, early cutting, high grading, and tax evasion with respect to such timber harvests."

During the investigation, the Section 301 Committee obtained the following information concerning these allegations:

- A 1989 Ministerial Decree specifies the types of fines levied on Indonesian concessionaires who violate concession regulations. Out of the 581 concessionaires, 371 have had some type of fine levied against them since 1988; 607 violations have been recorded, for which approximately $21 million (at current exchange rates) in fines have been levied. Since 1988, 66 concession licenses have been revoked.
- In August 1992, Indonesia adopted a new procedure to track trees through the harvesting process to increase collected fees and deter poaching. The form used for this purpose is difficult to forge. If a log arrives at a mill without the required form, a fine of 10 times the royalty fee is assessed.
- Indonesia is making greater use of remote sensing information from satellites to monitor the rate of harvest and the presence of logging roads. An aerial survey is performed of the concession prior to its award, and thereafter an aerial survey is performed annually.
- Both the reforestation and license fees charged to Indonesian concessionaires have been increased.

USTR currently is unaware of any reason to question the validity of this information, which suggests that Indonesia has taken steps in recent years to enforce timber concession terms.

4. Trade Effects of the Alleged Practices

All available data indicates that prices of Jelutong logs in Indonesia actually have increased since the imposition of the export tax. In fact, prices for Jelutong logs appear to have increased more rapidly than other prices in the Indonesian economy. Factors other than the practices alleged in the petition appear to have had a much greater impact on prices than the three practices alleged by petitioners if, in fact, those practices have affected Indonesian prices of Jelutong logs. These factors include (1) exchange rate fluctuations since 1985; and (2) labor and transportation cost advantages enjoyed by Indonesian producers.

Thus, the alleged practices do not appear to be suppressing Jelutong log prices in Indonesia. The petition acknowledges that elimination of the export taxes on Jelutong logs and lumber "would have neither a direct nor an immediate impact on the export prices of Indonesian Jelutong slat." Accordingly, the remedy proposed by the petition is the imposition of an off-setting export tax on pencil slat, rather than the elimination of the export tax on Jelutong logs.

Comments Received From Interested Persons

Comments submitted by interested persons during the investigation suggest that the alleged practices do not exist, are not unreasonable, or are not harming United States commerce. Dixon-Ticonderoga, a United States pencil manufacturer that uses both cedar slat produced domestically and Jelutong slat from Indonesia, claims that Indonesia's ability to produce export-quality pencil slat is largely due to technical assistance provided by Dixon in order to develop an alternative to cedar slat. Dixon further claims that Indonesian Jelutong slat is used to produce lower-quality pencils for sale in markets that do not require the more expensive, higher-quality cedar slat.

According to Dixon, even if Indonesia eliminated all of the practices alleged in the petition, Dixon would continue to purchase Jelutong slat from Indonesia because there would still be a price difference between cedar and Jelutong slat. Thus, Dixon contends that elimination of the Indonesian practices would have no impact on the current mix of pencil slat sales in third-country markets. Accordingly, Dixon asserts that the practices alleged in the petition impose no burden or restriction on U.S. commerce.

The International Hardwood Products Association (IHPA) also submitted comments during the investigation. IHPA is comprised of importers of primarily tropical hardwoods, as well as some foreign exporters and end users. IHPA claims that the petitioners enjoyed a monopolistic position in the pencil slat market until Jelutong became available as an alternative to cedar. IHPA further claims that Indonesia will enjoy a comparative advantage in the pencil slat market as long as U.S. producers use more expensive raw materials (*i.e.*, cedar).

Determination

Section 301(b) of the Trade Act authorizes discretionary action if the USTR determines that an act, policy or practice of a foreign government is unreasonable and burdens or restricts United States commerce. Section 304(a)(1) of the Trade Act requires the USTR to determine whether any act, policy or practice described in section 301(b) exists and, if so, what action, if any, the USTR should take.

The petition contends that the three alleged practices together constitute export targeting, which Congress has specifically defined as an "unreasonable" practice within the meaning of section 301(b) The legislative history indicates that a determination of export targeting under section 301(b) concerns three elements:

(1) There must be a government scheme or plan involving coordinated actions;

(2) Export targeting practices must be involved; and

(3) The targeting must have the effect of assisting a discrete class of companies or industries to become more competitive in their export activities.

Based upon the results of this intensive investigation, and the recommendations of the interagency Section 301 Committee, the USTR has determined that there is no evidence that the alleged practices are having the adverse trade effects asserted by the petition. Thus, even assuming that the alleged practices exist and would otherwise be considered actionable under section 301(b), there is no basis for concluding that they are burdening or restricting United States commerce. Accordingly, the USTR has determined that no action is appropriate in this investigation and that it should be terminated.

The United States will continue to pursue improvements in international trade of wood and wood products through multilateral negotiations with Indonesia and other countries. In terminating this investigation, the USTR has strongly urged the Government of Indonesia to support these initiatives.

Additional information submitted to or obtained by USTR during this investigation is contained in the public file, which is available for public inspection in the USTR Reading Room: Room 101, Office of the United States Trade Representative, 600 17th Street, NW., Washington, DC 20506. An appointment to review the file (Docket No. 301–90) may be made by calling Brenda Webb (202) 395–6186. The USTR Reading Room is open to the public from 10 a.m. to 12 noon and 1 p.m. to 4 p.m., Monday through Friday.

Jeanne E. Davidson,

Chairman, Section 301 Committee.,

BILLING CODE 3190–01–M

Identification of Priority Foreign Countries; Request for Public Comment

AGENCY: Office of the United States Trade Representative.

ACTION: Request for written submissions from the public concerning acts, policies to be considered with respect to identification of countries under section 182 the Trade Act of 1974, as amended (Trade Act).

SUMMARY: Section 182 of the Trade Act requires the United States Trade Representative (USTR) to identify countries that deny adequate and effective protection of intellectual property rights or deny fair and equitable market access to U.S. persons that rely on intellectual property protection. (19 U.S.C. 2242.) In addition, the USTR is required to determine which of those countries identified are priority foreign countries. Such priority countries would be subject to initiation of a "special" 301 investigation.

The USTR requests written submissions from the public concerning foreign countries' acts, policies, and practices that are relevant to the decision whether that country partner should be identified under section 182 of the Trade Act.

DATES: Submissions must be received on or before 12 noon on Friday, February 12, 1993.

FOR FURTHER INFORMATION CONTACT: Emery Simon, Deputy Assistant USTR for Intellectual Property (202) 395–6864; Gilbert Donahue at (202) 395–7320; or Catherine Field, Associate General Counsel (202) 395–3432, Office of the United States Trade Representative.

SUPPLEMENTARY INFORMATION: Pursuant to section 182 of the Trade Act of 1974, as amended by the Omnibus Trade and Competitiveness Act of 1988, the USTR must identify those countries that deny adequate and effective protection for intellectual property rights or deny fair and equitable market access to U.S. persons that rely on intellectual property protection. Those countries that have the most onerous or egregious acts, policies, or practices and whose acts, policies or practices have the greatest adverse impact (actual or potential) on relevant U.S. products are to be identified as priority foreign countries.

The USTR may not identify a country as a priority foreign country if it is entering into good faith negotiations, or making significant progress in bilateral or multilateral negotiations, to provide adequate and effective protection of intellectual property rights.

The USTR must decide whether to identify countries as priority foreign countries each year and issue a decision within 30 days after publication of the National Trade Estimate (NTE) report, i.e., no later than April 30, 1993. Priority foreign countries are potentially subject to initiation of an investigation under section 301 of the Trade Act.

Requirements for Submissions

Submissions should include a description of the problems experienced and the effect of the acts, policies, and practices on U.S. industry. Submissions should be as detailed as possible and should provide as a much information on methodology for assessing the effect of the acts, policies and practices. Comments must be filed in accordance with the requirements set forth in 15 CFR 2006.8(b) (55 FR 20593) and must be sent to Dorothy Balaban, Special Assistant to the Section 301 Committee, room 223, 600 17th Street, NW., Washington, DC 20506, no later than 12 noon on Friday, February 12, 1993. Because submissions will be placed in a file open to public inspection at USTR, business-confidential information should not be submitted.

Public Inspection of Submissions

Within one business day of receipt, submissions will be placed in a public file, open for inspection at the USTR Reading Room, in room 101, Office of the United States Trade Representative, 600 17th Street, NW., Washington, DC. An appointment to review the file may be made by calling Brenda Webb, (202) 395–6186. The USTR Reading Room is open to the public from 10 a.m. to 12 noon and from 1 p.m. to 4 p.m., Monday through Friday.

Carmen Suro-Bredie,

Assistant USTR for Intellectual Property and the Environment.

RAILROAD RETIREMENT BOARD

Agency Forms Submitted for OMB Review

SUMMARY: In accordance with the Paperwork Reduction Act of 1980 (44 U.S.C. chapter 35), the Railroad Retirement Board has submitted the following proposal(s) for the collection of information to the Office of Management and Budget for review and approval.

Summary of Proposal(s)

(1) *Collection title:* Financial Disclosure Statement

(2) *Form(s) submitted:* G–423

(3) *OMB Number:* 3220–0127

(4) *Expiration date of current OMB clearance:* Three years from date of OMB approval

(5) *Type of request:* Extension of the expiration date of a currently

approved collection without any change in the substance or in the method of collection
(6) *Frequence of response:* On Occasion
(7) *Respondents:* Individuals or households
(8) *Estimated annual number of respondents:* 2,100
(9) *Total annual responses:* 2,100
(10) *Average time per response:* 1.4166 hours
(11) *Total annual reporting hours:* 2,975
(12) *Collection description:* Under the Railroad Retirement and Railroad Unemployment Insurance Acts, the Railroad Retirement Board has authority to secure from an overpaid beneficiary a statement of the individual's assets and liabilities if waiver of the overpayment is requested.

Additional Information or Comments: Copies of the form and supporting documents can be obtained from Dennis Eagan, the agency clearance officer (312–751–4693). Comments regarding the information collection should be addressed to Ronald J. Hodapp, Railroad Retirement Board, 844 N. Rush Street, Chicago, Illinois 60611–2092 and the OMB reviewer, Laura Oliven (202–395–7316), Office of Management and Budget, room 3002, New Executive Office Building, Washington, DC 20503.

Dennis Eagan,

Clearance Officer.

BILLING CODE 7905–01–M

SECURITIES AND EXCHANGE COMMISSION

Forms Under Review by Office of Management and Budget

Agency Clearance Officer—John J. Lane (202) 272–5407.

Upon written request copy available from: Securities and Exchange Commission Office of Filings, Information, and Consumer Services, Washington, DC 20549.

Extension:

Rules 701, 702, 703 and Form 701—File No. 270–306, Form 8—File No. 270–158, Regulation B—File No. 270–102, Rule 236—File No. 270–118.

Notice is hereby given pursuant to the Paperwork Reduction Act of 1980 (44 U.S.C. 3501 *et seq.*), that the Securities and Exchange Commission ("Commission") has submitted for OMB approval extension of the following: Rules 701, 702, 703, and Form 701, Form 8, Regulation B, and Rule 236.

Filings on Form 701 and pursuant to the rules and regulation provide limited exemptions from the registration requirements of the Securities Act of 1933. Form 701 is filed by approximately 500 respondents annually at an estimated one burden hour per response.

Form 8 is used to file amendments to applications for registration of securities pursuant to section 12 of the Securities Exchange Act of 1934, or amendments to annual reports and other reports filed pursuant to sections 13 and 15(d) of that Act. There are approximately 6,856 Form 8 filings annually at an estimated 12 burden hours per response.

It is estimated that approximately five respondents file schedules and forms under Regulation B annually at an estimated 41 burden hours per response.

Approximately 10 respondents make filings pursuant to Rule 236 annually at an estimated 1.5 burden hours per response.

The estimated average burden hours are made solely for purposes of the Paperwork Reduction Act and are not derived from a comprehensive or even a representative survey or study of the costs of Commission rules or forms. General comments regarding the estimated burden hours should be directed to Gary Waxman at the address below. Any comments concerning the accuracy of the estimated average burden hours for compliance with Commission rules and forms should be directed to John J. Lane, Associate Executive Director, Securities and Exchange Commission, 450 Fifth Street, NW., Washington, DC 20549 and Gary Waxman, (PRA Project Nos. 3235–0093, 3235–0095; 3235–0141 and 3235–0347), Clearance Officer, Office of Management and Budget, room 3208, New Executive Office Building, Washington, DC 20503.

Dated: December 29, 1992.

Margaret H. McFarland,

Deputy Secretary.

BILLING CODE 8010–01–M

[Release No. 34–31668; File No. SR–NYSE–92–34]

Self-Regulatory Organizations; Proposed Rule Change by the New York Stock Exchange, Inc., Relating to Annual Regulatory Fee

December 29, 1992.

Pursuant to section 19(b)(1) of the Securities Exchange Act of 1934 ("Act"), 15 U.S.C. 78s(b)(1), notice is hereby given that on December 11, 1992, the New York Stock Exchange, Inc. ("NYSE" or "Exchange") filed with the Securities and Exchange Commission ("Commission") the proposed rule change as described in Items I, II and III below, which Items have been prepared by the self-regulatory organization.[1] The Commission is publishing this notice to solicit comments on the proposed rule change from interested persons.

I. Self-Regulatory Organization's Statement of the Terms of Substance of the Proposed Rule Change

The New York Stock Exchange is proposing to extend the applicability of the annual regulatory fee imposed pursuant to Rule 129 to all members and member organizations.[2]

II. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

In its filing with the Commission, the self-regulatory organization included statements concerning the purpose of and basis for the proposed rule change and discussed any comments it received on the proposed rule change. The text of these statements may be examined at the places specified in Item IV below. The self-regulatory organization has prepared summaries, set forth in section (A), (B) and (C) below, of the most significant aspects of such statements.

A. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

The purpose of the proposed rule change is to permit the Exchange to extend the regulatory fee imposed pursuant to Rule 129 to all members and member organizations. The fee was established to help offset expenses incurred by the Exchange for Financial/Operational ("FIN/OP") examinations and surveillance performed pursuant to its responsibilities under the Act.[3] The regulatory fee is presently collected only from members and member organizations for which the Exchange has been appointed the Designated Examining Authority ("DEA") by the

[1] The NYSE has amended the proposed rule change to clarify that the regulatory fee at issue is presently collected from members and member organizations for which the Exchange is the designated examining authority pursuant to Rule 17d–1 rather than 17d–2 of the Act. *See* letter from Mary Furlong, Director of Rule and Interpretive Standards, NYSE, to Cheryl Evans-Dunfee, Staff Attorney, Exchange Branch, Division of Market Regulation, SEC, dated December 29, 1992. See also note 4, infra.

[2] NYSE Rule 129 provides that is Board of Governors may impose charges on members to reimburse the Exchange, in whole or in part, for regulatory oversight services provided for the membership by the Exchange.

[3] *See* Securities Exchange Act Release Nos. 20277 (October 19, 1983), 48 FR 48562, and 20337 (October 31, 1983), 48 FR 51188 (File Nos. SR–NYSE–83–33 and SR–NYSE–83–34).

Commission under Rule 17d–1 of the Act.[4]

Exchange policy is to surveil and examine all members and member organizations irrespective of DEA designation. There are currently 536 Exchange member organizations of which all but 21 have been designated to the Exchange. Imposition of the regulatory fee on the 21 member organizations that have been designated to other SROs will help offset the costs incurred by the Exchange in performing FIN/OP functions for these organizations. These functions include: Field examinations; monthly review and analysis of FOCUS; review of year-end outside audits; preparation of risk assessment packages; and response to interpretive questions.

The NYSE believes that the proposed rule change is consistent with the requirement under section 6(b)(4) of the Act that an exchange have rules that provide for the equitable allocation of reasonable dues, fees and other charges among its members and issuers and other persons using its facilities. The NYSE also believes that the imposition of the regulatory fee to non-DEA organizations will provide for a more equitable allocation among all members and member organizations of regulatory related expenses.

B. Self-Regulatory Organization's Statement on Burden on Competition

The Exchange believes that the proposed rule change will impose no burden on competition not necessary or appropriate in furtherance of the purposes of the Act.

C. Self-Regulatory Organization's Statement on Comments on the Proposed Rule Change Received From Members, Participants or Others

The Exchange has not solicited, and does not intend to solicit, comments regarding the proposed rule change. The Exchange has not received any unsolicited written comments from members or other interested parties.

III. Date of Effectiveness of the Proposed Rule Change and Timing for Commission Action

Within 35 days of the publication of this notice in the **Federal Register** or within such longer period (i) as the Commission may designate up to 90 days of such date if it finds such longer period to be appropriate and publishes its reasons for so finding or (ii) as to which the self-regulatory organization consents, the Commission will:

(A) By order approve such proposed rule change, or

(b) Institute proceedings to determine whether the proposed rule change should be disapproved.

IV. Solicitation of Comments

Interested persons are invited to submit written data, views and arguments concerning the foregoing. Persons making written submissions should file six copies thereof with the Secretary, Securities and Exchange Commission, 450 Fifth Street, NW., Washington, DC 20549. Copies of the submission, all subsequent amendments, all written statements with respect to the proposed rule change that are filed with the Commission, and all written communications relating to the proposed rule change between the Commission and any person, other than those that may be withheld from the public in accordance with the provisions of 5 U.S.C. 552, will be available for inspection and copying in the Commission's Public Reference Section, 450 Fifth Street, NW., Washington, DC 20549. Copies of such filing will also be available for inspection and copying at the principal office of the NYSE. All submissions should refer to File No. SR–NYSE–92–34 and should be submitted by January 27, 1993.

For the Commission, by the Division of Market Regulation, pursuant to delegated authority.

Margaret H. McFarland,

Deputy Secretary.

American Capital Government Target Series, et al.; Application

December 29, 1992.

AGENCY: Securities and Exchange Commission ("SEC").

ACTION: Notice of Application for Exemption under the Investment Company Act of 1940 (the "Act").

APPLICANTS: American Capital Government Target Series ("Trust") and American Capital Asset Management, Inc. ("Adviser").

RELEVANT ACT SECTIONS: Order requested under section 17(b) for an exemption from section 17(a), and under rule 17d–1(b) to permit a joint transaction otherwise prohibited by section 17(d) and rule 17d–1(a).

SUMMARY OF APPLICATION: Applicants seek an order that would permit one of the Trust's two portfolios to acquire all of the assets and assume all of the liabilities of the Trust's other portfolio.

FILING DATE: The application was filed on November 10, 1992.

HEARING OR NOTIFICATION OF HEARING: An order granting the application will be issued unless the SEC orders a hearing. Interested persons may request a hearing by writing to the SEC's Secretary and serving applicants with a copy of the request, personally or by mail. Hearing requests should be received by the SEC by 5:30 p.m. on January 25, 1993, and should be accompanied by proof of service on applicants, in the form of an affidavit or, for lawyers, a certificate of service. Hearing requests should state the nature of the writer's interest, the reason for the request, and the issues contested. Persons who wish to be notified of a hearing may request notification by writing to the SEC's Secretary.

ADDRESSES: Secretary, SEC, 450 Fifth Street, NW., Washington, DC 20549. Applicants, c/o American Capital Asset Management, Inc., 2800 Post Oak Blvd., Houston, Texas 77056.

FOR FURTHER INFORMATION CONTACT: Barry A. Mendelson, Senior Attorney, at (202) 504–2284, or C. David Messman, Branch Chief, at (202) 272–3018 (Division of Investment Management, Office of Investment Company Regulation).

SUPPLEMENTARY INFORMATION: The following is a summary of the application. The complete application may be obtained for a fee at the SEC's Public Reference Branch.

Applicant's Representations

1. The Trust was organized on June 24, 1990 as a Massachusetts business trust. The Trust is registered under the Act as an open-end, diversified, management investment company. The Trust is comprised of two investment portfolios: Portfolio '97 and Portfolio '98 (the "Portfolios"). The Adviser provides investment advisory, administrative, and management services to the Portfolios.

2. Portfolio '97 and Portfolio '98 have the same investment objectives and policies, the same fee structure, and similar investment portfolios. Both Portfolios invest at least 80% of their assets in obligations issued or guaranteed by the United States government or its agencies or instrumentalities. The only substantive

difference between the two Portfolios is the liquidation date. Portfolio '97 is scheduled to liquidate on December 16, 1997; Portfolio '98 is scheduled to liquidate on May 1, 1998.

3. In its capacity as custodian of the Portfolios, Amalgamated Bank of New York ("Amalgamated") owned of record, as of October 30, 1992, approximately 21% of the outstanding shares of Portfolio '97 and approximately 47% of the outstanding shares of Portfolio '98.

4. The trustees of the Trust, including a majority of those trustees who are not "interested persons" (as defined in the Act) of the Trust ("Disinterested Trustees") have approved a Plan of Reorganization ("Plan") pursuant to which Portfolio '97 will acquire all of the assets and assume all of the liabilities of Portfolio '98. The net asset value of the shares Portfolio '97 issues in the exchange will equal the net asset value of the shares of Portfolio '98 then outstanding. Each shareholder of Portfolio '98 will receive that number of full and fractional shares of Portfolio '97 equal in value as of the date of the exchange to the value of such shareholder's shares of Portfolio '98.

5. The Trust will submit the proposed Plan to the shareholders of Portfolio '98 for their approval at a meeting called for that purpose to be held on or about March 31, 1993. A majority of the outstanding shares of Portfolio '98 will be required to approve the acquisition.

6. The proposed reorganization will result in an increase in the asset size of Portfolio '97. The Trust expects that, to the extent expenses remain relatively fixed and do not vary with asset size, this increase will result in economies of scale to the benefit of all shareholders of the combined Portfolio. Management will be facilitated by having fewer Portfolios and certain expenses, including brokerage and research costs, audit fees, and general administrative costs, are expected to decrease as a result.

7. The proposed transaction will not have adverse tax consequences for the shareholders. No gain or loss will be recognized by Portfolio '98 or its shareholders as a result of the reorganization, and applicants will receive an opinion of tax counsel to this effect before consummating the reorganization.

8. The Adviser will pay all of the direct and indirect expenses of the proposed transaction.

Applicants' Legal Analysis

1. Section 2(a)(3) of the Act defines the term "affiliated person," in relevant part, as:

(A) any person directly or indirectly owning, controlling, or holding with power to vote, 5 per centum or more of the outstanding voting securities of such other person; (B) any person 5 per centum or more of whose outstanding voting securities are directly or indirectly owned, controlled, or held with power to vote, by such person; (C) any person directly or indirectly controlled by or under common control with, such other person * * *.

The Portfolios would be considered affiliated persons of one another if they are deemed to be under "common control." In this regard, since the Portfolios are part of the same investment company, they have common trustees and officers, and a common investment adviser. In addition, by virtue of its ownership of the Portfolios' stock, Amalgamated, the Portfolios' custodian, arguably is a "5% affiliate" of each Portfolio. If so, Portfolio '97 would be an affiliated person of an affiliated person (*i.e.*, Amalgamated) of Portfolio '98, and vice-versa.

2. Section 17(a) of the Act, in relevant part, prohibits any affiliated person of a registered investment company, or any affiliated person of such a person, from knowingly selling to or purchasing from such investment company any security or other property.

3. Rule 17a–8 under the act exempts from the prohibitions of section 17(a) mergers, consolidations, or purchases or sales of substantially all of the assets involving registered investment companies which may be affiliated persons, or affiliated persons of an affiliated person, solely by reason of having a common investment adviser, common directors, and/or common officers. Because the Portfolios may be affiliated with one another other than through their adviser, directors, and officers, applicants may not rely on rule 17a–8. Nevertheless, applicants have agreed to comply with the substantive requirements of the rule. Specifically, the trustees of the Trust, including a majority of the Disinterested Trustees, have determined that the proposed reorganization will be in the best interests of the shareholders of each Portfolio and will not result in the dilution of the current interests of any such shareholder.

4. Section 17(b) of the Act authorizes the SEC to exempt any transaction from the provisions of section 17(a) if the terms of the transaction, including the consideration to be paid or received, are reasonable and fair and do not involve overreaching on the part of any person concerned; the transaction is consistent with the policy of each registered investment company concerned; and the transaction is consistent with the general purposes of the Act.

5. Applicants contend that the proposed reorganization meets the standards of section 17(b). Among other things, applicants assert that (a) the shareholders of both Portfolios will benefit from the reorganization (as discussed above), (b) the Adviser will bear all costs of the reorganization, (c) the reorganization is subject to approval of the shareholders of Portfolio '98, who will receive a proxy statement containing information about the transaction, (d) the reorganization will have no adverse tax consequences for shareholders of either Portfolio, and (e) the exchange will be made at net asset value and will not result in dilution of the current interests of any shareholder.

6. Section 17(d) and rule 17d–1(a), taken together, prohibit an affiliated person of a registered investment company, or an affiliated person of such a person, acting as principal, from participating in, or effecting any transaction in connection with, any joint enterprise or joint arrangement in which such registered company is a paricipant, unless an application relating thereto has been filed with the SEC and an order approving the joint transaction has been entered.

7. Rule 17d–1(b) provides that in determining whether to grant an order, the SEC must consider whether participation of each Portfolio in the reorganization is consistent with the provisions, policies and purposes of the Act, and the extent to which each Portfolio's participation is on a basis different from or less advantageous than that of other participants.

8. Applicants contend that the proposed reorganization meets the standards of rule 17d–1(b). In particular, they note that each Portfolio will participate in the reorganization on a basis not different from or less advantageous than that of the other Portfolio. Moreover, applicants submit that the participation of Amalgamated (as a shareholder of each Portfolio) in the organization is consistent with rule 17d–1 because Amalgamated will receive no benefit different from an other Portfolio '98 shareholder. Finally, applicants note that although the Adviser and its affiliates may receive some benefits from the reorganization, the Adviser will bear all of the costs thereof.

For the SEC, by the Division of Investment Management, pursuant to delegated authority.

Margaret H. McFarland,

Deputy Secretary.

BILLING CODE 8010–01–M

[Rel. No. IC–19185; 812–7496]

First Prairie Money Market Fund et al.; Application

December 29, 1992.

AGENCY: Securities and Exchange Commission ("SEC").

ACTION: Notice of application for exemption under the Investment Company Act of 1940 (the "Act").

APPLICANTS: First Prairie Money Market Fund (the "Fund") and The First National Bank of Chicago ("FNBC").

RELEVANT ACT SECTIONS: Exemption requested pursuant to sections 6(c) and 17(b) from section 17(a).

SUMMARY OF APPLICATION: Applicants seek an order to permit the Fund to enter into repurchase agreements with FNBC or an affiliate of FNBC.

FILING DATE: The application was filed March 22, 1990 and amended on January 10, 1992, August 7, 1992, and November 27, 1992. Counsel for the applicants has represented by letter dated December 24, 1992, that another amendment, the substance of which is incorporated herein, will be filed during the notice period.

HEARING OR NOTIFICATION OF HEARING: An order granting the application will be issued unless the SEC orders a hearing. Interested persons may request a hearing by writing to the SEC's Secretary and serving applicants with a copy of the request, personally or by mail. Hearing requests should be received by the SEC by 5:30 p.m. on January 25, 1993, and should be accompanied by proof of service on the applicants, in the form of an affidavit or, for lawyers, a certificate of service. Hearing requests should state the nature of the writer's interest, the reason for the request, and the issues contested. Persons who wish to be notified of a hearing may request notification by writing to the SEC's Secretary.

ADDRESSES: Secretary, SEC, 450 5th Street, NW., Washington, DC 20549. Applicants, First Prairie Money Market Fund, 144 Glenn Curtiss Boulevard, Uniondale, New York 11556–0144; The First National Bank of Chicago, One First National Plaza, Chicago, Illinois 60670–0120.

FOR FURTHER INFORMATION CONTACT: Marilyn Mann, Special Counsel, at (202) 504–2259, or Barry Miller, Senior Special Counsel, at (202) 272–3018 (Division of Investment Management, Office of Investment Company Regulation).

SUPPLEMENTARY INFORMATION: The following is a summary of the application. The complete application may be obtained for a fee at the SEC's Public Reference Branch.

Applicants' Representations

1. The Fund is an open-end, diversified management investment company. It is a money market fund that maintains a net asset value of $1.00 per share for purchases and redemptions and, pursuant to rule 2a–7 under the Act, uses the amortized cost method of valuing its securities.

2. FNBC is the Fund's investment adviser. FNBC, a wholly owned subsidiary of First Chicago Corporation, a registered bank holding company, is a commercial bank offering a range of banking and investment services. The Bank of New York acts as the Fund's custodian.

3. The Fund is divided into two separate portfolios, the Money Market Series and the Government Series (each, a "Series"). The Money Market Series invests in short-term money market obligations, including repurchase agreements with banks or primary government securities dealers reporting to the Federal Reserve Bank of New York. The Government Series invests only in short-term securities issued or guaranteed as to principal and interest by the U.S. Government, and repurchase agreements with respect to such securities with banks that have total assets in excess of $1 billion or securities dealers that have issued securities rated at least A–1 by Standard & Poor's Corporation.

4. The Fund's shares are purchased primarily by clients of FNBC and its affiliates, including qualified custody, agency, and trust accounts, through their accounts with FNBC and its affiliates. The Fund's shares may be purchased through automatic investment transactions. In these transactions, FNBC, as agent, follows the standing instructions of such clients and automatically invests excess cash balances in the clients' accounts in shares of the Money Market Series or the Government Series.[1] Currently, these "sweep" transactions are effected automatically by computer each Fund business day as of the next determined net asset value (currently, 12 noon, New York time). The machine processing required to tabulate the day's transactions in such clients' accounts and other shareholder accounts, however, is completed later in the day (normally no earlier than 11 p.m., New York time) when the daily processing for FNBC's accounting system is completed (the "Completion Time"). Therefore, total assets to be invested in each Series through the "sweep" program each day are not known until that evening and are invested in each Series at the respective net asset values determined on the following day.

5. The current operation of the "sweep" program makes the Fund materially less attractive to FNBC's clients because they lose a day's income on funds invested through the program and, for "sweeps" accomplished on a Friday, lose a weekend's income.

6. To permit FNBC, as the Fund's investment adviser, to invest anticipated net assets attributable to the "sweep" program on the same day that they are available for investment (despite the fact that the exact amount thereof will not be known until after the time for investment that day), FNBC or an affiliate proposes to enter into overnight repurchase agreements with each Series. Such assets would be invested in Fund shares as of the time the relevant Series determined its net asset value (the "Pricing Time") on the same day the sweep occurs.

7. The Fund proposes to enter into a master repurchase agreement with FNBC or one of its affiliates, which is substantially the same as the industry standard master repurchase agreement promulgated by the Public Securities Association, covering all repurchase agreement transactions (the "Master Repurchase Agreement").

8. Applicants intend to limit the amount of each Series' net assets that may be invested pursuant to the order with FNBC or its affiliates to a percentage upon which applicants from time to time may agree (the "Maximum Purchase Amount"), which percentage may fluctuate but shall not exceed 15%.

9. To facilitate the repurchase transaction where the exact amount of the overnight repurchase agreement and, consequently, the required collateral is not known until the following day, FNBC, at no cost to the Fund, will maintain at all times in a segregated sub-custodian account in the name of the relevant Series collateral at least equal to 102% of the Maximum Purchase Amount. The Fund will promptly notify FNBC of any increase or decrease in a Series' net asset value and

[1] In accordance with the standing instructions of FNBC's clients, the computer program also provides for the automatic redemption of Fund shares held in an account as of the next determined net asset value if the cash balance in the account is less than the minimum balance specified by the client.

FNBC will adjust the amount of collateral maintained in the segregated account daily so that it at least equals 102% of the Maximum Purchase Amount. The relevant Series will have a perfected security interest in the repurchase agreement collateral held in such account.

10. FNBC's Trust Department would act as the Fund's sub-custodian pursuant to a sub-custodian agreement approved by the Fund's Board of Trustees, including a majority of the Trustees who are not "interested persons," as defined in the Act, of either FNBC or the Fund.[2] The Fund's assets held by FNBC's Trust Department would be maintained in a segregated custodial account established on its behalf in accordance with the rules and standards of the Comptroller of the Currency and the Act. FNBC's Trust Department would receive the eligible securities transferred to it in its capacity as sub-custodian for the relevant Series and hold them in a manner complying with the requirements of section 17(f) of the Act. After the Completion Time that evening, for a particular Series, the records maintained by FNBC for its client's accounts and by FNBC's Trust Department in its capacity as the Series' sub-custodian would show:

(i) For FNBC's client accounts, a cash entry for the amount of Series shares purchased or redeemed and a corresponding entry to the client accounts for the number of Series shares purchased or redeemed as of the Pricing Time through operation of the computer "sweep" program; and

(ii) For the Fund's sub-custodian account, all purchase and sale transactions and the net cash proceeds, if any, received by the Series through the operation of the "sweep" (or, conversely, the net redemption proceeds paid or payable by the Series if there were net redemptions). In addition, the relevant Series' sub-custodian account would reflect the specific amount in fact invested in the particular transaction (including the ownership of the securities securing the repurchase agreement). If the "sweep" had resulted in unanticipated net redemptions for the Series, the relevant sub-custodian account would reflect this fact and show no ownership of any of such securities transferred by FNBC or its affiliates to the account, since (contrary to expectations) none of the Fund's assets had been used to purchase the securities. To the extent that transferred securities exceeded the relevant Series' assets that were available for investment (as shown by the results of the day's computer processing), FNBC or the appropriate affiliate would be shown to be the owner of such securities.

11. After the Completion Time, FNBC would transmit to the Fund's transfer agent records relating to these automatic investment transactions. The transfer agent's records would show an entry to each of the corresponding shareholder accounts for the number of Fund shares automatically purchased or redeemed as of the Pricing Time through operation of the "sweep."

12. Each Series will purchase only securities in which it may invest as described in its prospectus and statement of additional information and as limited by rule 2a-7 under the Act. The Master Repurchase Agreement into which the Fund, on behalf of each Series, proposes to enter will be collateralized only by U.S. Treasury Bills, Notes, and Bonds, with a remaining maturity of one year or less and value at least equal to 102% of the repurchase price (including accrued interest). The transactions will comply with the guidelines set forth in Investment Company Act Release No. 13005 (February 2, 1983). The Master Repurchase Agreement will be subject to annual approval by the Fund's Board of Trustees, including a majority of the Trustees who are not "interested persons" (as defined in the Act) of the Fund or FNBC or its affiliates.

13. The transactions would be "repurchase agreements" for purposes of Chapter 11 of the United States Bankruptcy Code and the Financial Institutions Reform, Recovery and Enforcement Act of 1989. These statutes provide that, if the bankruptcy of the counterparty occurs, the repurchase agreement can be liquidated without being subject to the potential delay associated with the automatic stay or similar provisions of those statutes. If the transactions were not "repurchase agreements" as defined under those statutes, the Fund might encounter significant liquidity problems if a large percentage of its assets were invested in repurchase agreements with a bankrupt counterparty.

14. Each of the Money Market Series and the Government Series currently invests a substantial amount of their respective net assets on an overnight basis. The Fund's average daily portfolio maturity customarily is between 20 and 40 days for the Money Market Series and 15 and 25 days for the Government Series. Applicants intend to limit the Maximum Purchase Amount at a level that they believe should avoid reducing average daily portfolio maturity and thus the yield for the Fund.[3]

15. FNBC will continue to solicit independent quotes from third parties for the proposed "sweep" transactions, but to date FNBC has been unable to find any unaffiliated entity willing to engage in such transactions on a basis as favorable to the Fund as the proposed arrangement with FNBC. The repurchase agreement counter-party will not know until the next day the amount, if any, of such transactions. This delay results because the daily processing for FNBC's accounting system normally is completed well into the night of the day the order is placed and the actual amount to be invested in the repurchase transaction is not known and, thus, monies in respect thereof cannot be transmitted until the next morning. Unaffiliated third parties will not agree to operate in this "look back" manner with the Fund on a basis as favorable to the Fund as the proposed arrangement with FNBC.

16. Before any repurchase agreements are entered into pursuant to the exemption, the Fund or FNBC must obtain and document competitive quotations from at least two other dealers with respect to repurchase agreements that are comparable in terms of size, maturity, and collateral, except that if quotations are unavailable from two such dealers only one other competitive quotation is required. In addition, the transactions for which quotations are sought will be conventional overnight repurchase agreements in which the funds would be transferred by the Fund on the same day that the transaction is entered into, and then returned by the counterparty on the following day. Before entering into a transaction pursuant to the exemption, a determination will be required that the income to be earned from the repurchase agreement is at least equal to that available from the other dealers from which quotes were obtained. As set forth in the application, applicants enter into repurchase agreements on an ongoing basis and, therefore, believe they are capable of obtaining such quotes.

Applicants' Legal Analysis

1. Section 17(a) of the Act, among other things, generally prohibits certain entities affiliated with an registered investment company, when acting as principal, from knowingly selling to or purchasing from the investment

[2] The sub-custodian account may be maintained with FNBC's Trust Department or a nominee qualified to act as a custodian pursuant to section 17(f) of the Act and references herein to FNBC's Trust Department shall mean either entity.

[3] Applicants point out that, not infrequently, the overnight rate is as favorable as and, in certain cases, may exceed the rate available for securities with longer maturities.

company any security. Among the entities precluded from dealing as principal with a registered investment company under section 17(a) are any affiliated person of the investment company and any affiliated person of an affiliated person of the investment company. Section 2(a)(3) of the Act defines any investment adviser of such company. Therefore, FNBC, as the Fund's investment adviser, and its affiliates are subject to the prohibitions contained in section 17(a) with respect to the Fund.

2. Section 6(c) of the Act provides in relevant part that "the Commission, * * * by order upon application, may * * * exempt any person, security, or transaction * * * from any provision or provisions of [the Act] or of any rule or regulation thereunder, if and to the extent that such exemption is necessary or appropriate in the public interest and consistent with the protection of investors and the purposes fairly intended by the policy and provisions of [the Act]."

3. Section 17(b) of the Act provides that "notwithstanding [section 17(a)], any person may file with the Commission an application for an order exempting a proposed transaction * * * from one or more provisions of that subsection. The Commission shall grant such application and issue such order of exemption if evidence establishes that * * * (1) the terms of the proposed transaction, including the consideration to be paid or received, are reasonable and fair and do not involve overreaching on the part of any person concerned; (2) the proposed transaction is consistent with the policy of each registered investment company concerned, as recited in its registration statement and reports filed under [the Act]; and (3) the proposed transaction is consistent with the general purposes of [the Act]."

4. The Fund believes that the relief requested is appropriate and in the public interest because it will permit the Fund to invest at a favorable price net assets attributable to the "sweep" program on the same day that such assets are available for investment. Applicants believe that a more attractive "sweep" program will result in increased assets for the Fund. A larger asset base for the Fund will benefit all Fund shareholders by reducing the amount of Fund expenses indirectly borne by each shareholder, thereby increasing investors' returns.

5. FNBC and its affiliates are aware of the potential conflict of interest inherent in the operation of the "sweep" program if the proposed relief is granted. FNBC, therefore, has established procedures and conditions to be followed by its employees and agents to prevent any overreaching on the part of any person that could act to the detriment of the Fund and to ensure that each transaction is effected on a reasonable and fair basis.

6. The Fund's overnight position should not necessarily reduce its yield. If the operation of the proposed "sweep" program shortens the Fund's average daily portfolio maturity, the effect of such reduction would be minimal because: (i) The Fund currently maintains a relatively short average daily portfolio maturity; (ii) as FNBC develops more experience operating the "sweep" program, FNBC will be able to manage the maturity of that portion of the Fund's assets held outside the sub-custodian account for the program so as to provide optimal liquidity levels; and (iii) upon receipt of such assets currently; the Fund has invested such assets in overnight or very short-term obligations in any event, but such investment occurs one day later. Thus, applicants believe that any effect on yield as a result of the proposed relief would be negligible. In addition, operation pursuant to the independent pricing mechanism set forth in condition 8 should provide yields from "sweep" investments that are no lower than similar non-sweep Fund investments.

7. Based on the arguments set forth above, applicants believe that the requested relief is necessary and appropriate in the public interest and consistent with the protection of investors and the purposes fairly intended by the policy and provisions of the Act. Applicants also believe that the terms of the proposed transactions, including the consideration to be paid or received, are reasonable and fair and do not involve overreaching on the part of any person concerned, that the proposed transactions are consistent with the policy of each Series, as set forth in the Fund's registration statement and reports filed under the Act, and that the proposed transactions are consistent with the general purposes of the Act.

Applicants' Conditions

Applicants agree that the order of the Commission granting the requested relief shall be subject to the following conditions:

1. No FNBC or affiliate "sweep" account client will be permitted to affect a transaction after the sweep has occurred and the Fund's net asset value has been computed for that day.

2. The legal or compliance department of, and internal and outside auditors for, FNBC or its affiliates will prepare guidelines for FNBC and affiliate personnel to ensure that the transactions described herein comply with the conditions set forth herein and that the integrity of the program is maintained. The Fund's independent public accountants will verify assets held in each sub-custodian account in accordance with rule 17f–2 under the Act. The legal or compliance department and auditors will periodically monitor the activities of FNBC and its affiliates in connection with the operation of the "sweep" program to ensure that the conditions set forth in the application are adhered to.

3. If granted, the terms of the relief would be disclosed fully in the Fund's prospectus and statement of additional information. A schedule of all transactions with FNBC and its affiliates will be filed with each semi-annual report filed by the Fund with the Commission pursuant to sections 30(a) and 30(b)(1) of the Act. FNBC will provide the Fund's Board of Trustees with a full report of the transactions under the "sweep" program, as described herein, no less frequently than quarterly. FNBC also will provide the Board of Trustees with a statement that, as the Fund's investment adviser, it determined the principal transactions to be necessary and appropriate under the circumstances.

4. The Fund and FNBC will maintain such records with respect to those transactions conducted pursuant to the exemption as may be necessary to confirm compliance with the conditions to the requested relief. In this regard, the Fund will maintain an itemized daily record of repurchase agreement transactions entered into pursuant to the exemption, showing for each transaction: the Series that entered into the transaction; the entity with which the Series entered into the transaction; the purchase and repurchase prices; the type and amount of collateral; the date fixed for termination of the transaction; and the time and date of the transaction. For each transaction, such records also shall document the quotations received from other dealers in accordance with condition no. 8, including: The names of the dealers; the prices quoted; and the times and dates the quotations were received. The records required by this condition will be maintained and preserved in the same manner as records required under rule 31a–1(b)(1).

5. The Maximum Purchase Amount will be the percentage of each Series' net assets upon which the applicants from time to time may agree, which percentage may fluctuate but shall not

exceed 15%. As to a particular Series on a particular day, the amount invested pursuant to the exemption will not exceed the amount swept into such Series on such day.

6. All records pertaining to the sweep program will be preserved for a period of not less than six years, the first two years in an easily accessible place, from the end of the fiscal year in which any sweep transaction occurred.

7. In connection with overnight repurchase agreement transactions pursuant to the Master Repurchase Agreement, FNBC will maintain at all times during operation of the "sweep" program in a segregated sub-custodian account in the name of each Series collateral comprised only of U.S. Treasury Bills, Notes or Bonds, with remaining maturities of one year or less, and valued at least equal to 102% of the Maximum Purchase Amount. In addition, FNBC or its affiliates would transfer such collateral through the book entry system of the Federal Reserve and, in connection therewith, the relevant Series' sub-custodian account with FNBC's Trust Department will be designated by Fedwire as the recipient of such securities and FNBC's internal records and written confirmations will indicate that the collateral is being held on behalf and in such Series' name. The relevant Series thereby would acquire a security interest in the collateral.

8. Before any transaction may be conducted pursuant to the exemption, the Fund or FNBC must obtain such information as it deems necessary to determine that the price test set forth below has been satisfied. Before any repurchase agreements are entered into pursuant to the exemption, the Fund or FNBC must obtain and document competitive quotations from at least two other dealers with respect to repurchase agreements comparable to the type of repurchase agreement involved (including size, which would be at least equal to the Maximum Purchase Amount, maturity and collateral), except that if quotations are unavailable from two such dealers only one other competitive quotation is required. In addition, the transactions for which quotations are sought will be conventional overnight repurchase agreements in which the funds would be transferred by the Fund on the same day that the transaction is entered into, and then returned by the counterparty on the following day. Before entering into a transaction pursuant to the exemption, a determination will be required in each instance, based upon the information available to the Fund and FNBC, that the income to be earned from the repurchase agreement is at least equal to that available from the other dealers from which quotes were obtained.

For the SEC, by the Division of Investment Management, under delegated authority.

Margaret H. McFarland,

Deputy Secretary.

BILLING CODE 8010–01–M

[Investment Company Act Rel. No. 19187; International Series Rel. No. 515; 812–8222]

The Park Avenue Portfolio; Notice of Application

December 29, 1992.

AGENCY: Securities and Exchange Commission (the "SEC").

ACTION: Notice of Application for Exemption under the Investment Company Act of 1940 (the "Act").

APPLICANT: The Park Avenue Portfolio.

RELEVANT ACT SECTIONS: Order requested under section 6(c) for an exemption from the provisions of section 12(d)(3).

SUMMARY OF APPLICATION: Applicant seeks a conditional order permitting it to invest in equity and convertible debt securities of foreign issuers that, in each of their most recent fiscal years, derived more than 15% of their gross revenue from their activities as a broker, dealer, underwriter, or investment adviser ("Foreign Securities Companies"), provided that such investments comply with the provisions of proposed amended rule 12d3–1 under the Act.

FILING DATE: The application was filed on December 17, 1992.

HEARING OR NOTIFICATION OF HEARING: An order granting the application will be issued unless the SEC orders a hearing. Interested persons may request a hearing by writing to the SEC's Secretary and serving applicant with a copy of the request, personally or by mail. Hearing requests should be received by the SEC by 5:30 p.m. on January 25, 1993, and should be accompanied by proof of service on applicant, in the form of an affidavit or, for lawyers, a certificate of service. Hearing requests should state the nature of the writer's interest, the reason for the request, and the issues contested. Persons who wish to be notified of a hearing may request such notification by writing to the SEC's Secretary.

ADDRESSES: Secretary, SEC, 450 Fifth Street, NW., Washington, DC 20549. Applicant, 201 Park Avenue South, New York, New York 10003.

FOR FURTHER INFORMATION CONTACT: James J. Dwyer, Staff Attorney, at (202) 504–2920, or Elizabeth G. Osterman, Branch Chief, at (202) 272–3016 (Division of Investment Management, Office of Investment Company Regulation).

SUPPLEMENTARY INFORMATION: The following is a summary of the application. The complete application may be obtained for a fee from the SEC's Public Reference Branch.

Applicant's Representations

1. Applicant, a Massachusetts business trust, is registered as a diversified open-end management investment company under the Act. Applicant will consist of seven series upon the effectiveness of a post-effective amendment to its registration statement filed with the SEC on November 20, 1992. Only one of these funds, The Guardian Baillie Gifford International Fund (the "International Fund"), currently intends to invest in equity or convertible debt securities of foreign issuers. Guardian Baillie Gifford Limited acts as the investment adviser for the International Fund. Baillie Gifford Overseas Limited will serve as sub-adviser for the International Fund.

2. Applicant seeks to invest in equity securities and convertible debt securities of Foreign Securities Companies. Applicant seeks conditional relief from section 12(d)(3) of the Act to invest in equity and convertible debt securities of Foreign Securities Companies to the extent permitted in proposed amended rule 12d3–1 under the Act. See Investment Company Act Release No. 17096 (Aug. 3, 1989).

Applicant's Legal Conclusions

1. Section 12(d)(3) prohibits an investment company from acquiring any security issued by any person who is a broker, a dealer, an underwriter, or an investment adviser. Rule 12d3–1 provides an exemption from section 12(d)(3) for investment companies acquiring securities of an issuer that derived more than 15% of its gross revenues in its most recent fiscal year from securities-related activities, provided that these investments comply with certain conditions set forth in the rule.

2. Under rule 12d–1, an equity security of a Foreign Securities Company must be a "margin security" as defined in Regulation T promulgated by the Board of Governors of the Federal Reserve (the "Board") in order for the acquisition of such security by an investment company to be exempt from the prohibition of section 12(d)(3). Accordingly, Applicant may not invest in equity securities of a Foreign Securities Company that are comparable in quality to "margin securities," but

which do not fall within the definition of "margin securities" under Regulation T, because they are not registered in the United States, are not traded in United States over-the-counter markets, and are not included in the List of Foreign Margin Stocks published by the Board.

3. Proposed amended rule 12d3–1 provides that the "margin securities" requirement will be excused if the acquiring company purchases equity securities of Foreign Securities Companies that meet the qualitative criteria comparable to criteria applicable to equity securities of United States securities-related businesses.

Applicant's Condition

Applicant agrees that the proposed exemptive order will be subject to the following condition:

Applicant will comply with the proposed amendments to rule 12d3–1, Investment Company Act Release No. 17096 (Aug. 3, 1989), as they are currently proposed, or as they maybe reproposed, adopted, or amended.

For the SEC, by the Division of Investment Management, under delegated authority.

Margaret H. McFarland,

Deputy Security.

[FR Doc. 93–129 Filed 1–5–93; 8:45 am]

BILLING CODE 8010–01–M

[Release No. 35–25722]

Filings Under the Public Utility Holding Company Act of 1935 ("Act")

December 29, 1992.

Notice is hereby given that the following filing(s) has/have been made with the Commission pursuant to provisions of the Act and rules promulgated thereunder. All interested persons are referred to the application(s) and/or declaration(s) for complete statements of the proposed transaction(s) summarized below. The applications(s) and/or declaration(s) and any amendments thereto is/are available for public inspection through the Commission's Office of Public Reference.

Interested persons wishing to comment or request a hearing on the application(s) and/or declaration(s) should submit their views in writing by January 22, 1993 to the Secretary, Securities and Exchange Commission, Washington, DC 20549, and serve a copy on the relevant applicant(s) and/or declarant(s) at the address(es) specified below. Proof of service (by affidavit or, in case of an attorney at law, by certificate) should be filed with the request. Any request for hearing shall identify specifically the issues of fact or law that are disputed. A person who so requests will be notified of any hearing, if ordered, and will receive a copy of any notice or order issued in the matter. After said date, the application(s) and/or declaration(s), as filed or as amended, may be granted and/or permitted to become effective.

General Public Utilities Corp. (70–7473)

General Public Utilities Corporation ("GPU"), 100 Interpace Parkway, Parsippany, New Jersey 07054, a registered holding company, has filed a post-effective amendment to its application-declaration pursuant to sections 9(a), 10 and 12(c) of the Act and Rule 42 thereunder.

By orders dated December 29, 1987, (HCAR No. 24550), March 31, 1988 (HCAR No. 24612), August 5, 1988 (HCAR No. 24691) and September 11, 1989 (HCAR No. 24949), the Commission, among other things, authorized GPU to repurchase from time-to-time through December 31, 1992 up to 11 million shares of its common stock, par value $2.50 per share, in the open market, through odd-lot tender offers and/or from shares held under GPU's Tax Credit Act Employee Stock Ownership Plans upon their termination. The timing of those repurchases depends upon existing market conditions and the anticipated capital needs of GPU and its subsidiaries. At December 3, 1992, GPU had repurchased 7,491,432 shares of its common stock, all of which were repurchased prior to a two-for-one stock split effective May 29, 1991. GPU does not expect to repurchase any additional shares during the remainder of 1992.

GPU now requests authority to repurchase up to five million shares of its common stock in the open market, through privately negotiated transactions and/or through odd-lot tender offers from time-to-time from the effective date of the order herein through December 31, 1995. GPU has determined that the current cost of common stock equity is higher than the current cost of borrowed funds used to effect such repurchases. In all other respects, the transactions as previously authorized by the Commission would remain unchanged.

At September 30, 1992, GPU's equity ratio, on a consolidated basis, was 46%. If GPU were to repurchase the entire five million shares of common stock for which authority is requested, GPU's consolidated equity ratio would be reduced to 45%, assuming an average purchase price of $26.00 per share.

For the Commission, by the Division of Investment Management, pursuant to delegated authority.

Margaret H. McFarland,

Deputy Secretary.

BILLING CODE 8010–01–M

[Investment Company Act Rel. No. 19183; 812–8088]

Technology Funding Medical Partners I, L.P., et al.; Application

December 28, 1992.

AGENCY: Securities and Exchange Commission ("SEC").

ACTION: Notice of Application for Exemption under the Investment Company Act of 1940 ("Act").

APPLICANTS: Technology Funding Medical Partners I, L.P. (the "Partnership"); and Technology Funding Inc. and Technology Funding Ltd. (the "Managing General Partners").

RELEVANT ACT SECTIONS: Order requested under section 6(c) granting an exemption from sections 2(a)(19) and 2(a)(3)(D).

SUMMARY OF APPLICATION: Applicants seek a conditional order determining that: (a) The Independent General Partners (as hereinafter defined) are not "interested persons" of the Partnership, the other general partners, or the principal underwriter of the Partnership solely by reason of their status as general partners of the Partnership and co-partners of the other general partners; and (b) no limited partner owning less than five percent of the units of limited partnership interest in the Partnership is an "affiliated person" of the Partnership or any of its partners solely by reason of being a limited partner of the Partnership and a co-partner of the other limited partners and the general partners.

FILING DATE: The application was filed on September 14, 1992 and amended on December 1, 1992, December 23, 1992, and December 24, 1992.

HEARING OR NOTIFICATION OF HEARING: An order granting the application will be issued unless the SEC orders a hearing. Interested persons may request a hearing by writing to the SEC's Secretary and serving applicants with a copy of the request, personally or by mail. Hearing requests should be received by the SEC by 5:30 p.m. on January 22, 1993, and should be accompanied by proof of service on applicants, in the form of an affidavit or, for lawyers, a certificate of service. Hearing requests should state the nature of the writer's interest, the reason for the

request, and the issues contested. Persons who wish to be notified of a hearing may request such notification by writing to the SEC's Secretary.

ADDRESSES: Secretary, SEC, 450 Fifth Street, NW., Washington, DC 20549. Applicants, 2000 Alameda de las Pulgas, suite 250, San Mateo, California 94403.

FOR FURTHER INFORMATION CONTACT: James E. Anderson, Staff Attorney, at (202) 272–7027, or C. David Messman, Branch Chief, at (202) 272–3018 (Division of Investment Management, Office of Investment Company Regulation).

SUPPLEMENTARY INFORMATION: The following is a summary of the application. The complete application may be obtained for a fee from the SEC's Public Reference Branch.

Applicants' Representations

1. The Partnership, organized as a Delaware limited partnership on September 3, 1992, will be governed by an Amended and Restated Limited Partnership Agreement (the "Partnership Agreement"). The Partnership has elected to be a business development company pursuant to section 54(a) of the Act. As a business development company, the Partnership will be subject to sections 55 through 65 of the Act and to those sections of the Act made applicable to business development companies. The Partnership will terminate no later than December 31, 2006. The Partnership has organized as a limited partnership because applicants believe that the partnership form is a more appropriate investment vehicle for a closed-end entity of limited duration seeking long-term capital appreciation by making venture capital investments.

2. On October 30, 1992 the Partnership filed a registration statement on Form N–2 under the Securities Act of 1933 with respect o a proposed public offering of up to 300,000 units of limited partnership interest in the Partnership (the "Units"). The maximum proceeds from the offering will be $30 million.

3. The general partners of the partnership initially will consist of three individual general partners (the "Individual General Partners") and the Managing General Partners. The initial Individual General Partners will act as independent general partners (the "Independent General Partners") (defined to be individuals who are not "interested persons" of the Partnership within the meaning of the Act). The number of Individual General Partners may not be less than three nor more than nine, and a majority of the Individual General Partners must be Independent General Partners. Only natural persons may serve as Individual General Partners. The Partnership Agreement provides that if at any time the number of Independent General Partners is reduced to less than a majority of the Individual General Partners, the remaining Independent General Partners must, within 90 days, designate one or more successor Independent General Partners so as to restore the number of Independent General Partners to a majority.

4. The Individual General Partners will provide overall guidance and supervision with respect to the operations of the Partnership. The Individual General Partners will perform the same functions and have the same duties and responsibilities that the Act imposes on the boards of directors of business development companies organized in corporate form. The Independent General Partners will assume the responsibilities and obligations imposed by the Act upon disinterested directors of a business development company organized in corporate form. In addition to fiduciary duties, the Individual General Partners will, among other things, have responsibilities with respect to the management and underwriting arrangements of the Partnership, the custody arrangements with respect to portfolio securities, fidelity bonding, and transactions with affiliates.

5. The Managing General Partners, Technology Funding Inc. and Technology Funding Ltd., are a California corporation and a California limited partnership, respectively. Both Managing General Partners are registered investment advisers under the Investment Advisers Act of 1940. Under the Partnership Agreement, the Managing General Partners, subject to the guidance and supervision of the Individual General Partners, are responsible for the management of the Partnership's investments and will provide other management and administrative services.

6. As compensation for their services, the Managing General Partners will receive an allocation of 20% of the Partnership's net profits (as defined in the Partnership Agreement, as well as the following fees: a fee equal to 2% of total limited partner capital contributions for each year of partnership operations until six years after the completion of the public offering of Units, and thereafter declining by 10% per year, as compensation for partnership overhead; reimbursement for organizational and offering expenses and operational costs (as defined in the Partnership Agreement) up to a maximum of 5% of total limited partner capital contributions;[1] and a sales commission of up to 8% of the gross proceeds of the offering, of which up to 7% will be reallowed to unaffiliated broker-dealers. The sales commission will be paid to Technology Funding Securities Corporation, a wholly-owned subsidiary of Technology Funding Inc.

7. The limited partners of the Partnership have no right to participate in the control of the Partnership's business. The Partnership Agreement, consistent with the Act, authorizes the limited partners to vote on certain matters, including the election or removal of general partners, approval or termination of certain arrangements with affiliates of the Managing General Partners, ratification or rejection of the appointment of the independent certified public accountants of the Partnership, approval of the sale of all or substantially all of the Partnership's assets, and amendments to the Partnership Agreement. The Partnership will obtain an opinion of counsel that the possession or exercise of these voting rights does not cause the limited partners to be participating in the control of the Partnership's business under the Delaware Revised Uniform Limited Partnership Act. The Partnership does not have an insurance policy which would provide coverage to persons who become limited partners. The Independent General Partners will periodically review the question of the appropriateness of obtaining an errors and omissions insurance policy for the Partnership.

8. The Partnership Agreement provides that any Individual General Partner may be removed either: (a) for cause by the action of two-thirds of the remaining Individual General Partners, including a majority of the remaining Independent General Partners; or (b) with the consent of a majority in interest of the limited partners. The Managing General Partners may be removed either: (a) By a majority of the Independent General Partners, with or without cause; or (b) with the consent of the majority in interest of the limited partners.

9. The Partnership Agreement provides that the Managing General Partners will not resign or withdraw from the Partnership unless a successor managing general partner or partners have been appointed and consented to

[1] Under the Partnership Agreement, overhead, organizational and offering expenses, and operational costs are each distinct categories and do not overlap.

by the limited partners. The Managing General Partners may resign or withdraw voluntarily only if: (a) At least 120 days prior to such withdrawal, all partners are given notice that the Managing General Partners propose to withdraw and that there will be substituted in their place a person or persons designated and described in such notification; (b) each of the proposed successor managing general partners represents that it is experienced in performing the functions that a managing general partner is required to perform under the Partnership Agreement, that it has the net worth required by the Partnership Agreement, and that it is willing to become a managing general partner under the Partnership Agreement and will assume all duties and responsibilities thereunder, without receiving any compensation for services from the Partnership in excess of that payable under the Partnership Agreement to the withdrawing Managing General Partners and without receiving any participation in the withdrawing Managing General Partners' interests other than that agreed upon by the withdrawing Managing General Partner and its successor; (c) there is on file at the principal office of the Partnership certified audited financial statements of each proposed successor managing general partner; (d) a majority in interest of the limited partners consent to the appointment of the successor; (e) the withdrawing Managing General Partner cooperates with the successor managing general partners so that the responsibilities of the withdrawing Managing General Partner may be transferred with as little disruption of the Partnership's business and affairs as practicable; and (f) the withdrawing Managing General Partner pays all expenses incurred as a result of its withdrawal.

Applicants' Legal Conclusions

1. Applicants request that the Independent General Partners be exempted from the provisions of section 2(a)(19) to the extent that the Independent General Partners would otherwise be deemed "interested persons" of the Partnership, the other general partners, or the principal underwriter of the Partnership solely because such Independent General Partners are general partners of the Partnership and co-partners of the Managing General Partners. Section 2(a)(19) excludes from the definition of "interested person" those individuals who would be "interested persons" solely because they are directors of an investment company. The Partnership has been structured so that the Independent General Partners are the functional equivalents of, and will assume the responsibilities and obligations imposed by the Act and the regulations thereunder on, the non-interested directors of an incorporated investment company. Granting the requested exemption from the provisions of section 2(a)(19) is consistent with the purposes, policies, and provisions of the Act.

2. Applicants request further that the SEC exempt all limited partners of the Partnership who own less than 5% of the Units of the Partnership from being deemed under section 2(a)(3)(D) of the Act to be "affiliated persons" of the Partnership or any of its other partners solely because such limited partner is a partner of the Partnership and any of such other persons are partners with one another in the Partnership. Section 2(a)(3)(D) of the Act provides that an "affiliated person" of an entity includes, *inter alia*, any partner or co-partner of such entity. Under section 2(a)(3), persons investing in a corporate entity as mere shareholders would have substantially the same rights to vote on the affairs of the entity as the rights that are accorded to the limited partners under the Partnership Agreement, but would not be thereby deemed "affiliated persons" of the corporate entity unless they held more than 5% of such entity's outstanding voting securities. Granting the requested exemption from the provisions of section 2(a)(3)(D) is consistent with the purposes, policies, and provisions of the Act and places investments in the Partnership on a more equal footing with investments in business development companies organized in corporate form.

Applicants' Conditions

If the requested order is granted, applicants agree to the following conditions:

1. The general partners of the Partnership, except the Managing General Partners, will be natural persons, and a majority of the Individual General Partners will not be interested persons of the Partnership.

2. The Individual General Partners will assume the responsibilities and obligations imposed by the Investment Company Act on directors of a business development company organized in corporate form. The Independent General Partners, all of whom will be Individual General Partners, will assume the responsibilities and obligations imposed by the Investment Company Act on non-interested directors of a business development company organized in corporate form.

3. Neither Managing General Partners will resign or withdraw as a Managing General Partner of the Partnership without two years prior notice unless a successor Managing General Partner has been appointed in accordance with the Partnership Agreement and the provisions of section 15(a), 15(c), and 15(f) of the Investment Company Act.

4. The limited partners will have the right to vote on all matters which would require their approval under the Investment Company Act if they were shareholders of a business development company organized in corporate form, including the right to elect or remove general partners, the right to approve any new or amended investment advisory contract, the right to approve proposed changes in the Partnership's fundamental policies, and the right to ratify or reject the appointment of auditors.

5. If a limited partner transfers his or her units in a manner which is effective under the Partnership Agreement, the general partners will ensure that such assignee, transferee or successor has all of the rights afforded a shareholder under the Investment Company Act.

6. The Partnership will obtain an opinion of counsel stating that the voting rights provided the Limited Partners do not subject the limited partners to liability as general partners under Delaware law.

7. The Partnership will obtain an opinion of counsel that the Partnership should be classified and treated as a partnership for federal income tax purposes.

8. The Partnership will obtain an opinion of counsel that the distributions and allocations provided for in the Partnership Agreement are permissible under section 205 and rule 205–3 under the Investment Advisers Act and under section 15(a) of the Investment Company Act.

9. If, under the Partnership Agreement, the Partnership is or becomes authorized to make in-kind distributions of portfolio securities to its Partners, no such in-kind distributions will be made until such time as the Partnership has obtained a no-action letter from the staff of the SEC or, alternatively, has obtained an order pursuant to section 206A of the Investment Advisers Act of 1940 permitting such distribution.

10. Under the Partnership Agreement, upon the removal of the Managing General Partners, all unrealized gains and losses are deemed realized for purposes of making a final allocation to the Managing General Partners. However, applicants will not deem such unrealized gains and losses realized

until they have received a no-action letter from the staff of the SEC confirming the Partnership's interpretation of section 205 of the Investment Advisers Act (i.e., that such treatment of unrealized gains and losses is appropriate) or, in the alternative, the Partnership has obtained an exemption from section 205 by SEC order issued pursuant to section 206A of the Investment Advisers Act, permitting the Partnership to deem such gains or losses to be realized.

For the SEC, by the Division of Investment Management, under delegated authority.

Margaret H. McFarland,

Deputy Secretary.

BILLING CODE 8010–01–M

[Release No. IC–19188; File No. 812–8172]

Travelers Growth and Income Stock Account for Variable Annuities, et al.; Application

December 29, 1992.

AGENCY: Securities and Exchange Commission (the "Commission" or "SEC").

ACTION: Notice of Application for Exemption under the Investment Company Act of 1940 (the "1940 Act").

APPLICANTS: The Travelers Growth and Income Stock Account for Variable Annuities ("Account GS"), The Travelers Quality Bond Account for Variable Annuities ("Account QB"), The Travelers Fund B for Variable Contracts ("Fund B") and The Travelers Fund B–1 for Variable Contracts ("Fund B–1") (referred to collectively as the "Applicants").

RELEVANT 1940 ACT SECTIONS: Order requested under section 17(b) of the 1940 Act for exemption from section 17(a).

SUMMARY OF APPLICATION: Applicants request an Order of the Commission under section 17(b) of the Investment Company Act of 1940 (the "1940 Act") granting an exemption from the provisions of section 17(a) of the 1940 Act to permit the transfer of portfolio securities from Fund B to Account GS and from Fund B–1 to Account QB.

FILING DATE: The Application was filed on August 19, 1992 and amended on November 9, 1992. Applicants will file another amendment during the notice period to delete references to in kind redemptions by Contract Owners.

HEARING OR NOTIFICATION OF HEARING: An order granting the application will be issued unless the Commission orders a hearing. Interested persons may request a hearing by writing to the Commission's Secretary and serving the Applicants with copies of the request, personally or by mail. Hearing requests must be received by the SEC by 5:30 p.m. on January 25, 1993, and should be accompanied by proof of service on the Applicants in the form of an affidavit, or, for lawyers, by certificate of service. Hearing requests should state the nature of the writer's interest, the reason for the request, and the issues contested. Persons may request notification of a hearing by writing to the Secretary of the Commission.

ADDRESSES: Secretary, SEC, 450 Fifth Street, NW., Washington, DC 20549. Applicants, One Tower Square, Hartford, Connecticut 06183–1050, Attention: Thomas A. Klee, Secretary.

FOR FURTHER INFORMATION CONTACT: Cindy J. Rose, Staff Accountant, or Wendell M. Faria, Deputy Chief, at (202) 272–2060, Office of Insurance Products, Division of Investment Management.

SUPPLEMENTARY INFORMATION: Following is a summary of the application; the complete application is available for a fee from the Commission's Public Reference Branch.

Applicant's Statements and Representations

1. Accounts GS and QB and Funds B and B–1 are open-end diversified management investment companies, registered under the 1940 Act on Form N–3 (File Nos. 811–1539, 811–2571, 811–1671 and 811–2583, respectively). The Travelers Investment Management Company serves as the investment adviser for Account GS and Fund B. Travelers Asset Management International Corporation serves as the investment adviser for Account QB and Fund B–1.

2. Funds B and B–1 currently serve as the underlying investment vehicles for certain variable annuity contracts (the "old Contracts") issued by the Travelers Insurance Company ("Travelers"). Due to the small asset size of Fund B and Fund B–1, which adversely affects the Funds' ability to diversify, Travelers intends to offer to Contract Owners of the old Contracts the opportunity to exchange their old Contracts for new variable annuity contracts (the "new Contracts") for which Accounts GS and QB serve as the underlying investment vehicles. The exchange offer will be made in compliance with Rule 11a–2 under the 1940 Act (the "Exchange Offer").

3. The proposed transactions will be executed on the effective date of the Exchange Offer if there is 100% participation in the Exchange Offer or all units are otherwise exchanged by the effective date. The transactions will be effectuated by exchanging all units in Funds B and B–1 held under the old Contracts for units of equal value in Accounts GS and QB under the new Contracts. The transactions will be settled by the transfer of all portfolio securities valued on the basis of net asset values as of the date of transfer from Fund B to Account GS and from Fund B–1 to Account QB. Net asset values will be determined in accordance with the methods set forth in the Statement of Additional Information of each of the Applicants. Funds B and B–1 will cease operations when the Exchange Offer and the proposed transactions have been completed.

Applicants' Legal Analysis and Conditions

1. Section 17(a)(1) of the 1940 Act prohibits any affiliated person of a registered investment company, or an affiliated person of an affiliated person, from selling any security or other property to such registered investment company. Section 17(a)(2) of the 1940 Act prohibits any of the persons described above from purchasing any security or other property from such registered investment company.

2. Each Applicant may be deemed to be an affiliated person or affiliated person of an affiliated person of each other Applicant under section 2(a)(3) of the 1940 Act, and the proposed transactions may be deemed to entail one or more purchases or sales of securities or property between the respective Applicants. Therefore, an exemption from section 17(a) of the 1940 Act, pursuant to section 17(b) of the 1940 Act, may be required.

3. Section 17(b) of the 1940 Act provides that the Commission may grant an Order exempting transactions prohibited by section 17(a) of the 1940 Act upon application if evidence establishes that: (a) The terms of the proposed transactions, including the consideration to be paid or received, are reasonable and fair and do not involve over-reaching on the part of any person concerned; (b) the proposed transactions are consistent with the investment policy of each registered investment company concerned, as recited in the registration statements and reports filed under the 1940 Act, and (c) the proposed transactions are consistent with the general purposes of the 1940 Act.

4. Applicants represent that the terms of the proposed transactions and the Exchange Offer, including consideration paid or received, are reasonable and fair and do not involve over-reaching on the

part of any person. Applicants will not pay any of the expenses of the Exchange Offer, as they will be borne entirely by Travelers. The new Contracts will have terms at least as favorable, and in certain respects more favorable, than the old Contracts. There will be no surrender charges or sales charges imposed in connection with the exchange of the old Contracts for the new Contracts, in as much as neither the old Contracts nor the new Contracts provide for a contingent deferred sales charge and the front-end sales charge on the new Contracts has been waived for amounts exchanged in connection with the Exchange Offer. The proposed transactions will be effectuated by exchanging all units in Funds B and B–1 for units in Accounts GS and QB, respectively, and making a corresponding transfer of all portfolio securities from Funds B and B–1 to Accounts GS and QB. The proposed transactions will not be completed if there is not 100% participation by Contract Owners. Without full participation, the Applicants will not be in the position of determining which portfolio securities are to remain in Funds B or B–1 and which are to be transferred to Accounts GS or QB, respectively. The Applicants believe that the proposed transactions are reasonable and fair since they will avoid any transaction costs for any of the Applicants. The portfolio securities will be valued for the purposes of the transfer in the same manner utilized by the Applicants for determining net asset value. Valuing the portfolio securities in this manner will result in consistent values for purposes of the proposed transactions and for determining the net asset values of Accounts GS and QB upon the completion of the proposed transactions.

5. The Exchange Offer will not be a taxable transaction for participants pursuant to section 1035 of the Internal Revenue Code and Revenue procedure 92–26. Deposits made under the old Contracts prior to August 14, 1982 will continue to retain their favorable tax status under the new Contracts.

6. The assets of Funds B and B–1 are declining in size because the old Contracts have not been offered to new customers since 1983. Applicants represent that if Contract Owners exchange their old Contracts for the new Contracts, and their assets are thereby invested in Accounts GS and QB, they will benefit from greater diversification in the portfolios and greater stability as assets are withdrawn.

7 The investment objectives, polices and restrictions of the respective Applicants involved in the proposed transactions are identical. Thus, the transfer of the portfolio securities which will occur between the corresponding funds are consistent with the objectives, policies and restrictions of Accounts GS and QB. Moreover, Accounts GS and QB will be able to retain the portfolio securities received from Funds B and B–1 upon completion of the proposed transactions.

8. Applicants represent that the proposed transactions are consistent with the general purposes of the 1940 Act, as enunciated in the findings and Declaration of Policy in Section 1 of the 1940 Act. Applicants assert that the proposed transactions do not present any of the issues or abuses that the 1940 Act is designed to prevent. Moreover, Applicants represent that the proposed transactions and the Exchange Offer will be effected in a manner consistent with the public interest and the protection of investors. The owners of the old Contracts will be fully informed of the terms of the Exchange Offer through the Prospectus for the new Contracts and explanatory correspondence, including an Exchange Authorization Form. Contract Owners will benefit from increased diversity in the portfolios underlying their new Contracts, and, if the Order is granted, will not incur any expenses in the transfer of portfolio securities.

9. Applicants also note that the proposed transactions fall within the intent of, but not the literal requirements of, Rule 17a–7 under the 1940 Act. Rule 17a–7 generally exempts from section 17(a) certain purchase and sale transactions between registered investment companies which are affiliated persons of each other, provided certain enumerated conditions are met. Applicants represent that, as a condition to any Order under section 17(b), they will comply with the conditions set forth in sub-paragraphs (c), (d), and (e) of Rule 17a–7, namely, that: (c) the proposed transactions are consistent with the policy of the Applicants and the old and new Contracts participating in the Exchange Offer, as recited in the applicable registration statements and reports filed under the 1940 Act; (d) no brokerage commissions, fees (except for customary transfer fees), or other remuneration will be paid in connection with the transactions; and (e) the Boards of Managers, including a majority of the members of the Boards who are not interested persons, have adopted procedures pursuant to which the proposed transactions may be effected, which are reasonably designed to provide that the conditions of paragraphs (c) and (d) of Rule 17a–7 are complied with, and will determine that the proposed transactions are effected in compliance with such procedures.

10. Applicants will not, however, meet the conditions of subparagraphs (a), (b) and (f) of Rule 17a–7. Applicants cannot comply with subparagraph (a) because no cash will be involved in the proposed transactions. Subparagraph (b) will not be complied with since the proposed transactions will be made on the basis of the relative net asset values of the securities to be exchanged, rather than on the basis of "current market price" as defined in subparagraph (b). Subparagraph (f) requires that Funds B and B–1 maintain and preserve permanently in an easily accessible place a written copy of the procedures (and any modifications thereto) described in paragraph (e) of Rule 17a–7, and maintain and preserve for at least six years a written record of each such transaction setting forth a description of the security purchased or sold, the identity of the person on the other side of the transaction, the terms of the purchase or sale transaction, and the information or materials upon which the determinations described in paragraph (e) of Rule 17a–7 were made. Since subparagraph (f) contemplates that each party will have continuing operations after a transaction pursuant to Rule 17a–7 (in order to be able to satisfy the recordkeeping requirements), Funds B and B–1 may not be able to comply if they cease operations upon the completion of the Exchange Offer. However, Accounts GS and QB represent that they will comply with such requirements. Moreover, the records of Funds B and B–1 will be maintained by Travelers for the required periods.

11. Applicants submit that because the proposed transactions involve a transfer of portfolio securities on the basis of net asset values, and because Funds B and B–1 may discontinue operations after the Exchange Offer is complete, the type of potential abuse which Rule 17a–7 was designed to guard against is not present. Applicants state that Rule 17a–7 was designed to permit investment companies to sell securities between themselves at a fairly determined price based on current market prices without incurring costs, including brokerage costs, to the detriment of Contract Owners. Applicants assert that the proposed transactions will be effected at fair market prices, and in substance, are of the type ordinarily exempted by Rule 17a–7

Conclusion

Applicants submit, for all of the reasons stated herein, that their exemptive request meets the standards set forth in section 17(b) of the 1940 Act and that an Order should therefore be granted.

For the Commission, by the Division of Investment Management, pursuant to delegated authority.

Margaret H. McFarland,

Deputy Secretary.

DEPARTMENT OF STATE

Bureau of Oceans and International Environmental and Scientific Affairs

[Public Notice 1749]

United States Man and the Biosphere Program; Request for Proposals for Tropical Ecosystems Directorate

The Tropical Ecosystems Directorate (TED) of the U.S. Man and the Biosphere Program (U.S. MAB) announces a call for proposals addressing the theme of sustainable use of tropical forest resources. A small number of research grants in the range of $5,000 to $12,000 will be awarded in mid–1993. Preference will be given to proposals focusing on the Maya Tri-National Region of Belize, Guatemala, and/or Mexico.

Funding Objectives

U.S. MAB funding should assist research teams to: Add a national researcher to their effort; better integrate conservation and sustainable development; add a particular discipline to an ongoing research project; or explore the application of ongoing site-specific research to an additional site in the Maya Tri-National region. U.S. MAB funding will not be provided for planning purposes.

Focal Issues

Within the broad thematic focus of sustainable use of tropical forest resources in the Maya Tri-National Region, U.S. MAB/TED encourages research projects addressing focal issues such as community-based production systems, tropical forest management for timber and/or non-timber forest products, economic valuation and accounting of tropical forest products and services, benefits and costs of low impact uses such as ecotourism, or integration of biodiversity conservation with production forestry.

Proposal Content

Each proposal should have a title page, a one page synopsis of the existing research project, two pages detailing the proposed use of U.S. MAB/TED funds that would be complementary to the TED core program, and a one-page budget with justification. No funds are available for institutional overhead; only direct costs can be supported.

Evaluation and Review Process

Because of limited available funding, U.S. MAB/TED will give greatest preference to those proposals that directly complement the objectives of the directorate's core program. Proposals will be evaluated for the intrinsic merit of the research, its policy relevance, applicability to promoting sustainable use of tropical forest resources in the May Tri-National Region, and the quality and demonstrated productivity of the principals. All potential proposers are encouraged to contact the Secretariat of the U.S. Man and the Biosphere Program, OES/EGC/MAB, U.S. Department of State, Washington, DC 20522–3706. Tel. (703) 235–2946, to request a description of the TED core program.

Complete proposals must be received by the U.S. MAB Secretariat by close of business February 19, 1993. The U.S. MAB Secretariat will notify all principals of the Directorate's final decisions by the first week of April, 1993. Funds will be committed to the managing institutions identified in the proposals during July, 1993. Principals will receive from the U.S. MAB Secretariat copies of all U.S. MAB/TED review evaluations of their proposal and a written notification of the Directorate's decision on their project.

Submission of Proposals

Mail proposals to: U.S. MAB Secretariat, OES/EGC/MAB, room 608, SA–37, U.S. Department of State, Washington, DC 20522–3706.

Individuals choosing to submit their proposals by Express Mail, Federal Express, UPS, etc., must use the following address: U.S. MAB Secretariat, rm. 608, 1555 Wilson Boulevard, Rosslyn, Virginia 22209.

Deadline for Proposals: 19 February 1993.

Page Limit: 5 pages, single-spaced.

Dated: December 22, 1992.

Roger E. Soles,

Executive Director, U.S. Man and the Biosphere Program, Office of Global Change.

BILLING CODE 4910–62–M

Applications for Certificates of Public Convenience and Necessity and Foreign Air Carrier Permits Filed Under Subpart Q During the Week Ended December 25, 1992

The following Applications for Certificates of Public Convenience and Necessity and Foreign Air Carrier Permits were filed under subpart Q of the Department of Transportation's Procedural Regulations (See 14 CFR 302.1701 et. seq.). The due date for Answers, Conforming Applications, or Motions to Modify Scope are set forth below for each application. Following the Answer period DOT may process the application by expedited procedures. Such procedures may consist of the adoption of a show-cause order, a tentative order, or in appropriate cases

a final order without further proceedings.

Docket Number: 48562.
Date filed: December 21, 1992.
Due Date for Answers, Conforming Applications, or Motion to Modify Scope: January 19, 1993.
Description: Application of American Trans Air, Inc., pursuant to section 401 of the Act and subpart Q of the Regulations, applies for a certificate of public convenience and necessity authorizing it to provide scheduled foreign air transportation of persons, property and mail between Indianapolis, Indiana, and Cancun, Mexico.

Docket Number: 48565.
Date filed: December 21, 1992.
Due Date for Answers, Conforming Applications, or Motion to Modify Scope: January 5, 1993.
Description: Application of Morris Air Service, Inc. request the Department for disclaimer of jurisdiction under section 401(h) and issue a new certificate in the name of Morris Air Corporation, pursuant to part 215 of the Department's Regulations.

Docket Number: 48566.
Date filed: December 22, 1992.
Due Date for Answers, Conforming Applications, or Motion to Modify Scope: January 20, 1993.
Description: Application of Lineas Aereas Allegro, S.A. de C.V., pursuant to section 402 of the Act and subpart Q of the Regulations, applies for a foreign air carrier permit for authority to provide charter foreign air transportation of persons and accompanying baggage between points in the United States and points in Mexico.

Docket Number: 48571.
Date filed: December 23, 1992.
Due Date for Answers, Conforming Applications, or Motion to Modify Scope: January 21, 1993.
Description: Application of Skybus, Inc., pursuant to section 401(d)(1) of the Act and subpart Q of the Regulations, applies for a certificate of public convenience and necessity authorizing it to engage in scheduled interstate and overseas air transportation of persons, property and mail between any point in any State of the United States or the District of Columbia, or any territory or possession of the United States, and any other point in any State of the United States or the District of Columbia, or any territory or possession of the United States.

Docket Number: 48572.
Date filed: December 23, 1992.
Due Date for Answers, Conforming Applications, or Motion to Modify Scope: January 20, 1993.
Description: Application of Biman Bangladesh Airlines, pursuant to section 402 of the Act and subpart Q of the Regulations, applies for a Foreign Air Carrier Permit to permit it to commence on March 1, 1993, the transportation of passengers, general cargo, and mail between Dhaka, Bangladesh, and New York, New York, and Newark, New Jersey, and points in between.

Docket Number: 48574.
Date filed: December 23, 1992.
Due Date for Answers, Conforming Applications, or Motion to Modify Scope: January 20, 1993.
Description: Application of American Trans Air, Inc. pursuant to section 401 of the Act and subpart Q of the Regulations, requests a certificate of public convenience and necessity to authorize scheduled foreign air transportation of persons, property, and mail between New York, New York and Riga, Latvia, both nonstop and via the intermediate point of Shannon, Republic of Ireland.

BILLING CODE 4910–62–M

Federal Railroad Administration

[FRA Docket No. H–92–9]

Petition for Waiver for Test Program; CSX Transportation

In accordance with 49 CFR part 211, notice is hereby given that CSX Transportation (CSXT) has submitted a petition dated November 2, 1992, for a temporary waiver of compliance with specific requirements of certain parts of title 49 Code of Federal Regulations in order to conduct a test of a performance-based method for determining the gage restraint capacity of the track structure, and to further develop this method as a possible alternative to sections of the existing Track Safety Standards.

The proposed test program is designed to evaluate a performance-based method of objectively determining the gage restraint capacity of the crossties and rail fasteners under continuous lateral and vertical loading of the track structure. The applied loads would sufficiently engage and exercise the rail fasteners, but would not permanently damage the track structure. The test program and associated procedures are meant to further develop this approach as an alternative to the present methods of determining adequate gage restraint capacity which are contained in § 213.109, "Crossties" and § 213.127, "Rail Fastenings", of the existing Track Safety Standards (49 CFR part 213).

CSXT and FRA recognize the desirability of improving present methods of determining the adequacy of gage restraint capacity. Present methods rely on visual and manual inspections by both railroad and FRA inspectors. These methods require an inspector to determine the gage restraint capacity of crossties and rail fasteners by observing indications of relative motion and by estimating component strength based on visual appearance. The proposed test program will evaluate a technique which provides a means of testing and objectively measuring the gage restraint capacity by applying controlled loads at the wheel/rail interface and then measuring the resulting deflections. Use of this technique is expected to maintain and enhance safety by detecting and marking safety critical locations so that immediate corrective action can be taken, while simultaneously producing a continuous, objective record of gage restraint capacity.

The test program is proposed to be conducted on the following track segments of the CSXT Florence Division: Aberdeen Subdivision; Hamlet Subdivision; Columbia Subdivision; and Andrews Subdivision. The Aberdeen, Hamlet, and Columbia Subdivisions form a through route between Raleigh, North Carolina and Savannah, Georgia via Hamlet, NC. The Andrews Subdivision is a route between Charleston, South Carolina and Hamlet, NC. The test program is expected to continue for at least three years unless terminated earlier for reasons not foreseen at the present time.

For the purposes of this test program, CSXT Transportation requests temporary relief from the following paragraphs of § 213.109: (b)(1)(i), (b)(2), (b)(3), (c), and (d); and from § 123.127.

FRA is seeking comments on this proposed test program from interested parties. FRA will take these comments into account in arriving at a final specification of conditions governing the conduct of the proposed test program, if conditional approval is granted by FRA'S Railroad Safety Board. Such comments may also have value in supporting FRA's consideration of modifications to the existing Track Safety Standards to incorporate performance-based alternatives.

Interested parties are invited to participate in this proceeding by submitting written views, data, or

comments. FRA does not anticipate scheduling a public hearing in connection with these proceedings since the facts do not appear to warrant a hearing. If any interested party desires an opportunity for hearing, they should notify FRA, in writing, before the end of the comment period and specify the basis for their request.

All communications concerning these proceedings should identify the appropriate docket number and must be submitted in triplicate to the Docket Clerk, Office of Chief Counsel, Federal Railroad Administration, Nassif Building, 400 Seventh Street, SW., Washington, DC 20590.

Communications received before February 1, 1993, will be considered by FRA before final action is taken. Comments received after that date will be considered as far as practicable. All written communications concerning these proceedings are available for examination during regular business hours (9 a.m.–5 p.m.) in room 8201, Nassif Building, 400 Seventh Street, SW., Washington, DC 20590.

Issued in Washington, DC on December 30, 1992.

Edward R. English,

Acting Associate Administrator for Safety.

[FR Doc. 93–105 Filed 1–5–93; 8:45 am]

BILLING CODE 4910–06–M

[Waiver Petition Docket Number H–92–7]

Public Hearing

The Union Pacific Railroad Company (UP) has requested a waiver of compliance from certain provisions of the Railroad Power Brakes Regulations (49 CFR part 232) (see FR 59197, December 12, 1992). The UP is seeking a waiver of compliance with § 232.12(b), which stipulates, "Each carrier shall designate additional inspection points not more than 1,000 miles apart where intermediate inspections will be made to determine that—

(1) Brake pipe leakage does not exceed five pounds per minute;

(2) Brakes apply on each car in response to a 20-pound service brake pipe pressure reduction; and

(3) Brake rigging is properly secured and does not bind or foul.

The UP is seeking the waiver for a six (6) month test period.

The FRA has received a request that a public hearing be held. Accordingly a public hearing is hereby set for 10 a.m. on January 15, 1993, in room 8236 of the Nassif Building located at 400 7th Street, SW., in Washington, DC.

The hearing will be an informal one and will be conducted in accordance with Rule 25 of the FRA Rules of Practice (49 CFR 211.25), by a representative designated by the FRA.

The hearing will be a nonadversary proceeding and, therefore, there will be no cross-examination of persons presenting statements. The FRA representative will make an opening statement outlining the scope of the hearing. After all initial statements have been completed, those persons wishing to make brief rebuttal statements will be given the opportunity to do so in the same order in which they made their initial statements. Additional procedures, if necessary for the conduct of the hearing, will be announced at the hearing.

Issued in Washington, DC on December 30, 1992.

Edward R. English,

Acting Associate Administrator for Safety.

DEPARTMENT OF THE TREASURY

Public Information Collection Requirements Submitted to OMB for Review

Dated: December 29, 1992.

The Department of Treasury has submitted the following public information collection requirement(s) to OMB for review and clearance under the Paperwork Reduction Act of 1980, Public Law 96–511. Copies of the submission(s) may be obtained by calling the Treasury Bureau Clearance Officer listed. Comments regarding this information collection should be addressed to the OMB reviewer listed and to the Treasury Department Clearance Officer, Department of the Treasury, Room 3171 Treasury Annex, 1500 Pennsylvania Avenue, NW., Washington, DC 20220.

U.S. Customs Service

OMB Number: 1515–0082
Form Number: CF 226
Type of Review: Extension
Title: Record of Vessel Foreign Repair or Equipment Purchase
Description: A 50-percent duty exists on equipment purchases for and repairs made to U.S. flag vessels in foreign ports. Arriving at its first U.S. port, the owner or master of a vessel is required to declare all equipment, parts, or materials purchased, and repairs made outside the U.S.
Respondents: Businesses or other for-profit
Estimated Number of Respondents: 2,000
Estimated Burden Hours Per Respondent: 30 minutes
Frequency of Response: On occasion
Estimated Total Reporting/Recordkeeping Burden: 4,000 hours
Clearance Officer: Ralph Meyer, (202) 927–1552, U.S. Customs Service, Paperwork Management Branch, Room 6316, 1301 Constitution Avenue, NW., Washington, DC 20229.
OMB Reviewer: Milo Sunderhauf, (202) 395–6880, Office of Management and Budget, Room 3001, New Executive Office Building, Washington, DC 20503.

Public Information Collection Requirements Submitted to OMB for Review

December 30, 1992.

The Department of Treasury has submitted the following public information collection requirement(s) to OMB for review and clearance under the Paperwork Reduction Act of 1980, Public Law 96–511. Copies of the submission(s) may be obtained by calling the Treasury Bureau Clearance Officer listed. Comments regarding this information collection should be addressed to the OMB reviewer listed and to the Treasury Department Clearance Officer, Department of the Treasury, room 3171 Treasury Annex, 1500 Pennsylvania Avenue, NW., Washington, DC 20220.

Internal Revenue Service

OMB Number: 1545–1012
Form Number: IRS Form 5305A–SEP
Type of Review: Revision
Title: Salary Reduction and Other Elective Simplified Employee Pension-Individual Retirement Accounts Contribution Agreement
Description: This form is used by an employer to make an agreement to provide benefits to all employees under a salary reduction Simplified Employee Pension (SEP) described in section 408(k). This form is not to be filed with IRS but is to be retained in the employer's records as proof of establishing such a plan, thereby justifying a reduction for contributions made to this SEP. The data is used to verify the deduction.
Respondents: Businesses or other for-profit
Estimated Number of Respondents/Recordkeepers: 100,000
Estimated Burden Hours Per Respondent/Recordkeeper:

Recordkeeping—40 minutes
Learning about the law or the form—56 minutes
Preparing the form—1 hour, 6 minutes
Frequency of Response: On occasion
Estimated Total Reporting/Recordkeeping Burden: 270,000 hours
Clearance Officer: Garrick Shear, (202) 622–3869, Internal Revenue Service, room 5571, 1111 Constitution Avenue, NW., Washington, DC 20224.
OMB Reviewer: Milo Sunderhauf, (202) 395–6880, Office of Management and Budget, room 3001, New Executive Office Building, Washington, DC 20503.

DEPARTMENT OF VETERANS AFFAIRS

Veterans' Advisory Committee on Environmental Hazards; Notice of Meeting

The Department of Veterans Affairs (VA) gives notice under Public Law 92–463 that a meeting of the Veteran's Advisory Subcommittee on Environmental Hazards will be held on Monday, January 25, 1993, in room 401 at 801 I Street, NW., Washington, DC 20004. The meeting will convene at 9 a.m. and adjourn at 5 p.m.

A full Committee meeting will be held on February 1–2, 1993, in room 946 at 801 I Street, NW., Washington, DC 20004. The meetings will convene at 9 a.m. and adjourn at 5 p.m.

The purpose of the meetings is to review information relating to activities during which significant numbers of veterans were exposed to ionizing radiation before January 1, 1970 (this includes activities other than participation in an atmospheric nuclear test or service with the occupation forces of Hiroshima, or Nagasaki, Japan.)

The meeting is open to the public to the capacity of the room. For those wishing to attend, contact Mrs. Leney Holohan, Department of Veterans Affairs Central Office (026B), 810 Vermont Avenue, NW., Washington, DC 20420, phone (202) 523–3911, prior to January 18, 1993.

Members of the public may direct questions or submit prepared statements for review by the Committee in advance of the meeting, in writing only, to Mr. Frederic L. Conway, Deputy Assistant General Counsel, (026B), Department of Veterans Affairs Central Office, 810 Vermont Avenue, NW., Washington, DC 20420. Submitted material must be received at least five days prior to the meeting. Such members of the public may be asked to clarify submitted material prior to consideration by the Committee.

Dated: December 21, 1992.

Diane H. Landis,

Committee Management Officer.

SECURITIES AND EXCHANGE COMMISSION

Meeting

Notice is hereby given, pursuant to the provisions of the Government in the Sunshine Act, Pub. L. 94–409, that the Securities and Exchange Commission will hold the following meeting during the week of January 4, 1993.

A closed meeting will be held on Tuesday, January 5, 1993, at 1:30 p.m.

Commissioners, Counsel to the Commissioners, the Secretary to the Commission, and recording secretaries will attend the closed meeting. Certain staff members who have an interest in the matters may also be present.

The General Counsel of the Commission, or his designee, has certified that, in his opinion, one or more of the exemptions set forth in 5 U.S.C. 552b(c) (4), (8), (9)(A) and (10) and 17 CFR 200.402(a) (4), (8), (9)(i) and (10), permit consideration of the scheduled matters at a closed meeting.

Commissioner Schapiro, as duty officer, voted to consider the items listed for the closed meeting in a closed session.

The subject matter of the closed meeting scheduled for Tuesday, January 5, 1993, at 1:30 p.m., will be:

Settlement of injunctive actions.
Institution of injunctive actions.
Regulatory matter bearing enforcement implications.
Institution of administrative proceedings of an enforcement nature.
Settlement of administrative proceeding of an enforcement nature.
Opinions.

At times, changes in Commission priorities require alterations in the scheduling of meeting items. For further information and to ascertain what, if any, matters have been added, deleted or postponed, please contact: Paul Atkins at (202) 272–2000.

Dated: January 4, 1993.

Nutrition Labeling of Meat and Poultry Products; Final Rule

DEPARTMENT OF AGRICULTURE

Food Safety and Inspection Service

9 CFR Parts 317, 320, and 381

[Docket No. 91–006F]

RIN 0583–AB34

Nutrition Labeling of Meat and Poultry Products

AGENCY: Food Safety and Inspection Service, USDA.

ACTION: Final rule.

SUMMARY: The Food Safety and Inspection Service (FSIS) is amending the Federal meat and poultry products inspection regulations by permitting voluntary nutrition labeling on single-ingredient, raw meat and poultry products, and by establishing mandatory nutrition labeling for all other meat and poultry products, with certain exceptions. FSIS is committed to providing consumers with the most informative labeling system possible. FSIS's nutrition labeling final regulations for meat and poultry products will parallel to the extent possible, as authorized by the Federal Meat Inspection Act and the Poultry Products Inspection Act, FDA's nutrition labeling regulations promulgated under the Nutrition Labeling and Education Act (NLEA).

EFFECTIVE DATE: July 6, 1994. The incorporation by reference of the "Official Methods of Analysis" of the Association of Analytical Chemists (AOAC) International, contained in this regulation, is approved by the Director of the Federal Register as of July 6, 1994.

FOR FURTHER INFORMATION CONTACT: Charles Edwards, Director, Product Assessment Division, Regulatory Programs, Food Safety and Inspection Service, U.S. Department of Agriculture, Washington, DC 20250, (202) 205–0080. Copies (printed or on 3.5" high-density diskettes) of the final rule may be obtained from the Policy Office, Linda Carey, FSIS Hearing Clerk, room 3171, South Building, Food Safety and Inspection Service, U.S. Department of Agriculture, Washington, DC 20250, (202) 720–7163.

SUPPLEMENTARY INFORMATION:

Executive Order 12291 and Effects on Small Entities

This final rule has been reviewed under USDA procedures established to implement Executive Order 12291 and has been classified as a major rule pursuant to section 1(b)(1) of that order because it is likely to result in an annual effect on the economy of $100 million or more. The Department reported its review in its Final Regulatory Impact Analysis (FRIA), which includes an analysis of the costs and benefits of nutrition labeling. FSIS estimates that the final rule will result in net societal benefits of $1.5 billion during the first 20 years after required nutrition labeling is available to consumers. For the purpose of this rule, net societal benefits are the estimated health benefits minus the compliance costs. The $1.5 billion represents the present value of net benefits, recognizing that changes in nutrition labeling requirements generate both costs and benefits that will occur in future years. All costs and benefits have been converted to a present value using a discount rate of 7 percent. Total 20-year health benefits were estimated to be $1.75 billion. Total 20-year compliance costs were estimated to range from $218 to $272 million.

To estimate future costs and benefits, it is necessary to use a specific time frame. The optimum time period is unknown. The Department selected 20 years, recognizing that 15 years or 25 years may also have been appropriate.

The final rule exempts products from required labeling if annual production of the product is less than 100,000 pounds and the producing firm has 500 or fewer employees. The Small Business Administration's definition of a small meat and poultry processing firm is one having 500 or fewer employees (13 CFR part 121). Thus, products produced by small businesses are exempt if they are produced at levels below 100,000 pounds. Without the small business and 100,000 pound exemption, 20-year costs would rise to $767 to $999 million. The exemption reduces benefits by $138 million. Thus, without the exemption, total benefits would be $1,892 million and estimated net benefits would range from $0.9 to $1.1 billion. The reduction in benefits is based on the estimate that the exemption applies to 7.3 percent of the volume of meat and poultry products that would require nutrition labeling without the exemption. Benefit estimates are directly related to the volume of products that are labeled. Therefore, the exemption reduces estimated benefits by 7.3 percent.

Without the exemption, the estimated compliance cost increases of $767 to $999 million are not the only type of costs that would be incurred. The Department believes that without the exemption many small businesses would have to close or substantially reduce the variety of products they now offer. Reductions in purchase options are a cost to consumers that could not be quantified for the Department's analysis.

The final rule allows processors of meat and poultry products the flexibility to base labeling information on laboratory analyses, recipe analyses using nutrition information from available data bases, or any combination of both. The rule does require that firms maintain a record of supporting information. The net benefit estimates are based on an assumption that 30 percent of the required nutrition information will be based on recipe analyses using data base values. The 30 percent estimate reflects concerns that (1) products using proprietary mixes as ingredients may not be able to make use of recipe analysis, and (2) some manufacturers might feel greater confidence in using laboratory analysis. The final 20-year cost estimates are reduced by from $32 to $50 million based on the estimate that 30 percent of required information will be supported by recipe analyses using data base values. When the predicted use of recipe analyses varied from 15 to 60 percent, the cost savings ranged from $16 to $100 million. Thus, if 60 percent of the required nutrition information was supported by recipe analyses, net benefits could increase by as much as $50 million.

Three alternatives to the final rule were considered. The first alternative was to allow for the voluntary nutrition labeling of all meat and poultry products. All voluntary labeling would have to be consistent with the regulations that FDA issues to implement the NLEA.

Based on responses to a 1992 survey of federally inspected firms, the Department now believes that earlier estimates that 40 percent of packaged processed products have nutrition labeling were high. It is possible that 40 percent of products in large supermarkets have nutrition labeling, but the overall level for all grocery stores is now estimated to be far lower. The Department has three serious concerns with the option of voluntary nutrition labeling on processed products. First, the analytical costs are going up substantially because of the nutrients/food components that will be required. Today, a large portion of voluntary labeling consists of an abbreviated format. The average cost of single laboratory analysis is estimated to be $231. To be consistent with revised FDA regulations, the average cost would rise to $406 per analysis. This voluntary option would not include the testing requirements associated with the current Nutrition Labeling Verification (NLV) program. The NLV program requires 26 analyses over a 20-year period. Based on public comments, the

cost estimates for both mandatory or voluntary labeling use a range of 7 to 13 total analyses per product over the 20-year period. Since the type and amount of testing will be determined by the producer, there is no reason to believe that analytical costs would differ between voluntary labeling and mandatory labeling.

The Department has three major reservations concerning the viability of the voluntary alternative. First, if all nutrition labeling were voluntary, the Department is concerned that higher analytical costs per analysis could result in fewer products having voluntary labeling than currently exists, a level that is already far lower than previously believed. Second, the Department has always been concerned that under a voluntary program, products containing large amounts of fat, saturated fat, cholesterol, or sodium are less likely to be labeled. Third, firms with relatively low levels of nutrition labeling responding to the USDA survey conducted in 1992, did not indicate that, under a voluntary program, they would be increasing nutrition labeling for the new products they plan to introduce over the next three years. These same firms indicate they have substantially more nutrition information on file than they are currently providing on product labels.

The second alternative was to change the exemption criterion on production per product. One variation would lower the exemption criterion on production to 50,000 pounds per year. The change in the 20-year estimated costs when including these products is very close to the change in 20-year projected benefits, thus, including these products between 50,000 and 100,000 pounds results in a minimal change in net benefits. When the impact on individual products and small businesses was considered, the Department decided against lowering the exemption level. Requiring nutrition labeling on the many small-firm products having between 50,000 and 100,000 pounds in annual production would most likely lead to many of those products no longer being produced, with a consequent loss of benefits to consumers. In small firms, these are not generally new or developmental products. They are more likely to represent stable, low production levels for limited markets.

On considering whether to raise the level of exemption from 100,000 to 250,000 pounds, the analysis also indicates little change in net benefits. However, as production increases, the lower relative impact on individual products greatly reduces the possibility that product lines will be unprofitable. The Department has chosen to allow extra time to implement nutrition labeling on products produced at levels between 100,000 and 250,000 pounds. The extra time reduced 20-year compliance costs by $8 to $10 million.

The third alternative was to remove the exemption criterion for employees and exempt all products produced at levels under 100,000 pounds. This option reduces estimated total benefits by $32 million to $1,722 million. Estimated total costs are reduced by from $39 to $47 million to a revised level of from $179 to $225 million. Net benefits remain at $1.5 billion, no change after rounding. To decide whether or not to accept this alternative, the Department had to look beyond the estimates of net benefits.

In developing a comprehensive economic impact for the final analysis, it is useful to view the meat and poultry processing industry as two separate industry sectors. There are medium to large firms that distribute most products regionally and nationally to supermarkets and other grocery stores. There are also a far larger number of small processors that sell most of their products in small specialty stores, locker plants, and butcher shops. Many also sell products through retail counters at production facilities. These small producers, however, market very little product through grocery stores and supermarket chains. In contrast, the Department believes that most products from firms with more than 500 employees are marketed through supermarkets.

This third alternative would result in a substantial increase in the number of exempt products sold in supermarkets. This becomes a concern when viewed in the context of the methodology used to estimate benefits. With the methodology used, overall health benefits come from having a high portion of volume labeled. There is, however, an implicit assumption that a sufficient number of products are labeled so that consumers are able to transfer information to like products. While the analysis cannot explicitly account for the reduction in the prevalence of labels in benefit estimates, each additional exemption weakens their reliability. The Department rejected this alternative in order to assure that both a high volume of products are labeled and the number of labeled products is above a subjective threshold that assures that consumers have sufficient information. Because compliance costs are a very small portion of total production costs for large firms, rejecting this alternative is not viewed as creating an economic hardship for large firms.

The Department developed the final rule with the goal of providing nutrition labeling on the maximum volume of packaged, processed retail product while assuring that small businesses producing small volumes of specialty products for limited markets are not at risk of going out of business or materially reducing the variety of products they deliver to their customers. Ensuring that a high percentage of total production is subject to nutrition labeling is important because that is what accounts for consumer purchases, consumption, and potential health effects.

This final rule achieves the goal. The Department estimates that 99 percent of the pounds of processed products distributed through approximately 24,000 supermarkets will be labeled. Likewise, approximately 95 percent of the volume of processed product marketed through an estimated 170,000 total supermarkets, grocery stores, and smaller convenience stores will be labeled. Finally, over 90 percent of the total production of packaged, processed product marketed through all retail outlets will include nutrition labeling for consumers.

The Department acknowledges that the benefit estimates are based on the total contribution of meat and poultry products to dietary fat, saturated fat, and cholesterol. Labeling will be required on most processed products purchased by consumers in retail stores. Together, with the voluntary program for retail store information on fresh products, consumers will have nutrition information on most of the meat and poultry products purchased for consumption at home. The Department believes that over time consumers will be able to transfer their knowledge gained through such labeling to meals eaten away from home. For that reason, benefits have not been reduced to account for the portion of meat and poultry consumed away from home.

The costs developed for the final analysis are the costs required to comply with the final rule. This analysis does not address the opportunity costs of alternative labeling schemes which would require different label information. It also excludes an analysis of the economic impact if firms choose to reformulate products or produce alternative products rather than comply with the labeling requirements of the rule.

The FRIA is available for public review in the office of the FSIS Hearing Clerk, room 3171, South Building, Food Safety and Inspection Service, U.S. Department of Agriculture, Washington, DC 20250. Copies are available from the

Hearing Clerk, without charge. The FRIA also satisfies the analysis requirements of the Regulatory Flexibility Act (Pub. L. 96–354, 5 U.S.C. 601 *et seq.*), which deals with the effect on small entities.

Executive Order 12778

This final rule has been reviewed pursuant to Executive Order 12778, Civil Justice Reform. This rule provides provisions for: (1) Voluntary nutrition labeling on single-ingredient, raw meat and poultry products; and (2) mandatory nutrition labeling for all other meat and poultry products, with the exceptions of (a) certain products produced by small businesses; (b) products used for further processing; (c) products that are not for sale to consumers; (d) products in small packages weighing less than ½ ounce; (e) products custom slaughtered or prepared; (f) products intended solely for export; (g) ready-to-eat products packaged at the retail level; and (h) multi-ingredient products processed at the retail level.

This final rule concerns labeling of meat and poultry products. States and local jurisdictions are preempted under the Federal Meat Inspection Act (FMIA) and the Poultry Products Inspection Act (PPIA) from imposing any marking, labeling, packaging, or ingredient requirements on federally inspected meat or poultry products that are in addition to, or different from, those imposed under the FMIA or the PPIA. States and local jurisdictions may, however, exercise concurrent jurisdiction over meat and poultry products that are outside official establishments for the purpose of preventing the distribution of meat or poultry products that are misbranded or adulterated under the FMIA or PPIA, or, in the case of imported articles, which are not at such an establishment, after their entry into the United States. Under the FMIA and the PPIA, States that maintain meat and poultry inspection programs must impose requirements on State inspected products and establishments that are at least equal to those required under the FMIA or PPIA. These States may, however, impose more stringent requirements on such State inspected products and establishments.

Upon its adoption, no retroactive effect will be given to this final rule, and applicable administrative procedures must be exhausted before any judicial challenge to its provisions or their application. Those administrative procedures are set forth in the rules of practice governing proceedings for labeling determinations at 9 CFR parts 335 and 381, subpart W.

Paperwork Requirements

This final rule requires manufacturers to maintain records supporting the validity of nutrient information on the labels of meat and poultry products, and to make such records available to FSIS upon request. This final rule requires most currently approved labels for all meat and poultry products, except for single-ingredient, raw products, to be revised and submitted to FSIS for approval, which will impact substantially on all such manufacturers. Manufacturers of single-ingredient, raw meat and poultry products opting to use nutrition labeling on the label will also be required to revise their labels and comply with requirements of the mandatory program.

The final rule also requires that manufacturers desiring to use (1) a new nutrient content claim not currently provided in the regulations, (2) a synonymous term to a term defined by regulation, or (3) an implied nutrient content claim in a brand name, or to amend the table for Product Categories and Reference Amounts, to submit to FSIS a standard labeling application, along with additional supporting information. The supporting information includes statements that (1) identify the term, (2) explain why the term is not false or misleading, (3) set forth the importance of the term and its relation to consumer nutrition or health, and (4) analyze the potential effect of the use of the proposed term on food consumption. The supporting information required to accompany the labeling application is a new paperwork burden being imposed upon manufacturers.

The paperwork requirements contained in this final rule have been submitted to the Office of Management and Budget for approval under the Paperwork Reduction Act (44 U.S.C. 3501 et seq.). If you wish to comment on the paperwork burden of this proposed rule, send your comments to: Office of Management and Budget, Desk Officer for FSIS, Office of Information and Regulatory Affairs, room 3208, New Executive Office Building, Washington, DC 20503 and to the Clearance Office, room 404–W, Administration Building, Washington, DC 20250.

Background

Introduction

The FMIA (U.S.C. 601 *et seq.*) and the PPIA (21 U.S.C. 451 *et seq.*) authorize the Secretary of Agriculture to establish and maintain inspection programs designed to assure consumers that meat and poultry products distributed in commerce or within designated States are wholesome, not adulterated, and are properly marked, labeled, and packaged.

FSIS regulates the labeling of meat and poultry products while FDA has responsibility for all other food labeling. FSIS conducts a prior label approval program under which labeling to be used on, or in conjunction with, meat and poultry products must be approved by the Agency prior to their use. FDA, on the other hand, relies primarily upon food manufacturers to comply with prescribed labeling regulations and to ensure that information contained on food labels is truthful and not misleading.

FSIS also develops standards of identity or composition for certain meat and poultry products under section 7(c) of the FMIA (21 U.S.C. 607(c)) and section 8(b) of the PPIA (21 U.S.C. 457 (b)). Under these authorities, FSIS has promulgated regulations prescribing definitions and standards of identity or composition (9 CFR part 319 and § 381.155 *et seq.*). FSIS also has promulgated regulations prescribing the content and design of labels (9 CFR part 317 and § 381.115 *et seq.*).

In 1973, FDA adopted a regulation, recodified in 1977 as 21 CFR 101.9, prescribing a specific labeling format to be included on food product labels when voluntary or mandatory nutrition information is provided. Currently required components that must be addressed include: calories, protein, carbohydrates, fat, sodium, two mineral elements (calcium and iron), and five vitamins (vitamin A, vitamin C, thiamin, riboflavin, and niacin). FSIS disseminates its nutrition labeling guidelines for meat and poultry products through the issuance by its Food Labeling Division of various policy memoranda. Copies of FSIS policy memoranda on nutrition labeling are available for public review in the FSIS Hearing Clerk's office.

The policy memos that relate in whole or in part to nutrition related issues will need to be rescinded or revised because of this final rule. Policy Memo 74A, dated November 1986, Exemptions from Nutrition Label Verification (NLV) Procedures or Partial Quality Control (PQC) Programs, and Policy Memo 85B, dated January 1988, NLV Procedures will no longer be in effect upon publication of this final rule. The following policy memoranda will remain in effect during the 18-month period between the date of publication and the effective date of this final rule, except that the provisions relating to data requirements and requirements for

an NLV procedure or PQC Program will not be enforced: Policy Memo 86, dated May 1985, Nutrition Labeling; Policy Memo 49C, dated June 1984, Sodium Labeling Guidelines; Policy Memo 70B, dated November 1987, Fat and Lean Claims; Policy Memo 71A, dated March 1986, Lite and Similar Terms; and Policy Memo 78, dated November 1984, Potassium Labeling Guidelines. These memoranda will be rescinded upon the effective date of this final rule. Policy Memo 16A, dated March 1981, Combinations of Ground Beef or Hamburger and Soy Products; Policy Memo 46, dated April 1982, Percent Fat Free Label Declarations; Policy Memo 7, dated August 1980, Information Panel; Policy Memo 39, dated January 1982 Caloric Claims/Weight Reduction; and Policy Memo 121, dated May 1991, Low Fat Ground Beef and Low Fat Hamburger with Added Ingredients, will remain in effect during the interim period but will be rescinded upon the effective date of this final rule. Policy Memo 69, dated March 1984, Labeling for Substitute Products; Policy Memo 19A, dated May 1987 Negative Labeling; and Policy Memo 114, dated July 1988, Point of Purchase Materials, will remain in effect during the interim period but will be revised upon the effective date of this final rule. Thus, companies desiring to continue declaring nutrition related information on labels in accordance with existing policy memoranda may do so until the effective date of this final rule. During this interim period, labels must conform either to policies established in the cited policy memorandum or these regulations, but not both. No combinations will be allowed. The policy memoranda discussed in this section reflect those listed in the proposal, and the addition of Policy Memo 7, Policy Memo 16A, Policy Memo 19A, and Policy Memo 121. These latter two policy memoranda have been added because FSIS agrees with the comments that stated these policy memoranda would also be impacted by the regulation.

Marketing Trends

Consumers are becoming increasingly aware of diet, health, and nutrition, and are concerned about the nutrient content of their foods. As a result, food manufacturers are adding nutrient content claims to allow consumers to make more informed food purchases. Claims such as "lean," "low fat," and "low cholesterol" have become common in today's marketplace. The use of such terms is subject to various interpretations and may mislead the consumer when purchasing products so labeled.

Nutrition Labeling Endeavors

The issue of providing consumers with more accurate and informative labeling prompted a series of undertakings by various segments of the Federal government to provide more nutrition information on the labels of all foods.

1. Congressional Action

On November 8, 1990, the Nutrition Labeling and Education Act of 1990 (NLEA), which amended certain provisions of the Federal Food, Drug, and Cosmetic Act, was enacted (Pub L. 101.535; 104 Stat. 2353). The NLEA requires mandatory nutrition labeling for most FDA-regulated packaged food products. It also requires FDA to issue voluntary nutrition guidelines to food retailers for providing nutrition information on 20 of each most frequently consumed, during a year, varieties of raw vegetables, raw fruits, and raw fish. Should food retailers fail to comply substantially with the guidelines, the NLEA requires FDA to issue mandatory requirements for these commodities.

2. FDA Regulatory Initiatives

In August 1989, FDA issued an advance notice of proposed rulemaking (ANPR) requesting comments on a wide range of labeling issues to determine what changes, if any, should be made on the labeling of foods regulated by FDA (54 FR 32610). In September 1989, FDA issued a notice of an extension of the comment period on the ANPR and announced a series of public hearings to be held throughout the Nation on food labeling (54 FR 38806). FSIS participated in these hearings, which were conducted by FDA in the fall of 1989. Issues discussed at the hearings related to nutrition labeling, ingredient labeling, descriptions of food, health messages, and nutrition label format.

After consideration of various comments received, FDA published a reproposed rule on February 13, 1990, on health messages (55 FR 5176), and three proposed rules on July 19, 1990, that would establish provisions on daily values for use in declaring nutrient content in nutrition labeling (55 FR 29476), require mandatory nutrition labeling on most food products that are meaningful sources of calories or nutrients (55 FR 29487), and define serving and portion sizes (55 FR 29517). FDA also published a tentative final rule on July 19, 1990 (55 FR 29456), prescribing regulations that define and provide for the use of the terms "cholesterol free," "low cholesterol," and "reduced cholesterol" in the labeling of foods.

The NLEA, as previously discussed, was enacted in November 1990, several months after FDA published its proposed rules and tentative final rule on food labeling. As a result, on January 11, 1991, FDA published a notice in the **Federal Register** (56 FR 1151) recognizing the impact of the NLEA on its pending rulemaking proceedings dealing with food labeling. FDA announced its plans to obtain comments in some form, or issue reproposals or supplemental proposals in some form, to ensure that all such regulations are consistent with the NLEA. These reproposals and supplemental proposals are discussed throughout this document.

3. NAS Study

In 1989, FSIS and the Public Health Service, U.S. Department of Health and Human Services (HHS), which includes FDA, jointly sponsored a study by the Institute of Medicine of the National Academy of Sciences (NAS) to provide options for improving food labeling. In its 1990 final report, NAS recommended that FSIS and FDA mandate nutrition labeling for all packaged foods under their respective jurisdictions, except for certain exemptions.[1] In addition, NAS presented recommendations on various facets of nutrition labeling including: Nutrition label content, serving sizes, U.S. Recommended Daily Allowances, adjectival descriptors, and ingredient labeling.

4. Advance Notice of Proposed Rulemaking (ANPR)

On April 2, 1991, FSIS published an ANPR in the **Federal Register** to solicit comments and recommendations from consumers, industry, public health officials, and other interested parties to assist the Agency in developing proposed regulations for nutrition labeling of meat and poultry products (56 FR 13564). In the ANPR, the Agency announced its intent to propose mandatory nutrition labeling regulations for most processed meat and poultry products and a voluntary program for fresh meat and poultry products. FSIS identified the following eight major food labeling issues that are of particular concern to the Agency: (1) Mandatory nutrition labeling, (2) nutrition label content, (3) U.S. Recommended Daily

[1] The NAS final report titled "Nutrition Labeling: Issues and Directions for the 1990s" is available for public review in the FSIS Hearing Clerk's office. Copies of the report are available for sale from the National Academy Press, 2101 Constitution Avenue, NW., Washington, DC 20418.

Allowances, (4) serving size, (5) descriptors and health messages, (6) food ingredients and standards of identity, (7) compliance and analytical methods, and (8) economic impact.

FSIS received 197 comments in response to the ANPR. After review and consideration of the comments received on the ANPR, FSIS issued a proposed rule in the **Federal Register** (56 FR 60302) on November 27, 1991, which is discussed in the following section.

5. Proposed Rules

On November 27, 1991, FSIS published a proposed rule in the **Federal Register** (56 FR 60302) to solicit comments and recommendations from consumers, industry, public health officials, and other interested parties to assist the Agency in developing the final regulations for nutrition labeling of meat and poultry products. In the proposed rule, the Agency announced its intent to amend the Federal meat and poultry products inspection regulations by permitting voluntary nutrition labeling on single-ingredient, raw meat and poultry products, and by establishing mandatory nutrition labeling for all other meat and poultry products, with the exception of products used for further processing.

FSIS received 1109 comments in response to the proposed rule. The majority of these comments (586) were submitted by food manufacturers and distributors, while 296 comments were received from consumers and consumer groups; 94 from trade associations; 24 from State governments; 15 from congressional offices on behalf of small businesses; 15 from food retailers; 10 from expediters and consultants; 10 from academia; 9 from the Federal Government; 9 from health professionals; 8 from foreign governments; 4 from professional organizations; 4 from financial institutions; 4 from meat and poultry associated industries; 4 from computerized database companies; 3 from food service organizations; 3 from health promotional groups; 2 from local governments; 2 from food ingredient developers; 2 from food industry technical advisors; and 1 each from a weight loss service, laboratory, oven and smokehouse supplier, and pharmaceutical official. One comment received did not address the scope of the proposed regulations. All comments submitted with respect to the proposed regulation were given due consideration and are discussed further in this document.

On March 25, 1992, FSIS published a supplemental (57 FR 10298) to the November 1991 proposed rule in the **Federal Register** regarding nutrition labeling of meat and poultry products. This supplemental proposed rule would (1) allow for the use of data bases and recipe analyses using data bases, as well as the proposed laboratory analyses, on which to base the nutrition information on processed meat and poultry product labels, and (2) provide a small business exemption from mandatory nutrition labeling. This action was taken because of the Agency's concern that its proposed rule not impose undue cost burdens and that its proposal be implemented in the most cost-effective manner possible while providing consumers with the same high quality nutritional information. FSIS received 247 comments in response to the supplemental proposed rule. The majority of these comments (161) were submitted by food manufacturers/ distributors, while 29 comments were received from trade associations; 14 from congressional members; 13 from State governments; 10 from academia; 9 from consumers and consumer groups; 2 from labeling consultants; and 1 each from a health professional, professional organization, food retailer, Federal Government Agency, and a computerized database company. Full and careful consideration was given to all written comments received. In view of these comments and the comments received at the public forums, the Agency is providing a small business exemption and the use of databases which are discussed later in this document.

On August 28, 1992, FSIS published a proposed rule in the **Federal Register** (57 FR 39332) regarding the adoption of a standard format for use in presenting nutrition information on the labels of meat and poultry products. In its proposal, FSIS proposed to establish the CONTROL WITH DIETARY GUIDANCE or the CONTROL WITH RECOMMENDED DAILY INTAKE RANGE as the standard format. The Agency also requested comments on the proposed formats, as well as other options. A discussion of the comments received is provided later in this document.

6. Implementation Date

On March 25, 1992, FSIS published a notice in the **Federal Register** (57 FR 10298) announcing the intended implementation date of its rulemaking for nutrition labeling of meat and poultry products. FSIS advised that, based upon a careful review of the comments received from the proposed rule (56 FR 60302) published on November 27, 1991, the Agency has decided that the nutrition labeling regulations concerning meat and poultry products will be implemented 18 months from the date of publication of the final rule. Thus, the nutrition labeling regulations shall become effective on July 6, 1994.

7. Public Forums

a. On April 4, 1991, FSIS participated in a FDA public meeting on food labeling to discuss issues related to serving size: (1) The basis for determining serving size, (2) units of measure to be used, (3) deviation allowed from standard serving sizes, (4) dual nutrition labeling with the second column on the basis of uniform weight, and (5) the definition of single-serving container. One recommendation expressed by all the participants was that USDA and FDA should work in harmony to establish uniform serving sizes for the foods the agencies regulate. In response to this, FSIS participated as a member of an Interagency Committee on Serving Sizes formed by FDA to ensure consistency in serving size requirements for all foods. The committee's recommendations and objectives are discussed in this document under section VI, Serving Sizes;

b. On January 23, 1992, FSIS published a notice in the **Federal Register** (57 FR 2692) announcing its participation in FDA's "Food Labeling Hearing" on January 30 and 31, 1992, in Bethesda, MD. The hearing provided an additional opportunity for interested persons to present their views on the proposed rulemaking entitled, "Nutrition Labeling of Meat and Poultry Products" (56 FR 60302). The hearing addressed several subject areas including mandatory nutrition labeling, nutrient content claims, and health claims;

c. In April 1992, FSIS issued a notice in the **Federal Register** (57 FR 14499) announcing three public forums on the small business exemption issues raised in its nutrition labeling supplemental proposed rule published March 25, 1992, as well as other issues of public concern specific to exempting small businesses from nutrition labeling. The public forums were held May 12 in Kansas City, MO; May 14 in Atlanta, GA; and May 21 in San Francisco, CA. Issues discussed at the hearings related to defining a small business, criteria for a small business exemption, the potential economic impact of nutrition labeling on small businesses, and the ramifications of exempting small businesses from nutrition labeling regulations;

d. On July 23, 1992, FDA issued a notice in the **Federal Register** (57 FR

32750) announcing a public hearing on the notice of proposed rulemaking on the format for the nutrition label that it published in the **Federal Register** of July 20, 1992. The public hearing, held on August 17 and 18, 1992, in Bethesda, MD, provided an opportunity for interested persons to present their views on the issues raised by the proposal. FSIS participated in the hearing.

Major Issues

The following discussion provides background information on the major issues of nutrition labeling and a summary of the comments received on FSIS's proposed rule, the supplemental rule, the format proposal, and the small business forums, and highlights of the Agency's final rule on nutrition labeling.

I. Codified Language

In response to the proposed rule, FSIS received many comments that suggested that the Agency should include all the codified language for meat and poultry products in the regulations under 9 CFR parts 317 and 381. The commenters stated that it is very difficult to go back and forth between FDA and FSIS regulations to look up different provisions for the nutrition labeling regulations.

FSIS agrees with the comments. However, FSIS and FDA desire to ensure as much harmonization as possible of the nutrition labels for all food products, including simultaneous publication of final regulations. Harmonization will ensure consistency of format and content for consumers and, thereby, will encourage the use of the new labels, while minimizing the cost of compliance on the food industry.

The NLEA dictates for FDA the timeframe for publication of the final regulation. In order for FSIS to issue nutrition labeling regulations simultaneously with FDA, FSIS must meet this same publication timeframe. The codified portion of FSIS's final regulations will cross reference all the provisions of FDA's regulations where the provisions are identical, and provide codified language only for those provisions where there are variations from FDA because of the different products that FSIS regulates. FDA's final rule on nutrition labeling, portions of which are cross referenced in this final rule, is published elsewhere in this issue of the **Federal Register**. FSIS plans to publish, in the near future, the codified language as it applies to meat and poultry products in its entirety in 9 CFR parts 317 and 381.

The implementation date for FSIS's regulations is July 6, 1994. The future codification of the regulations for nutrition labeling of meat and poultry products into 9 CFR part 317 and 381 does not postpone the implementation of nutrition labeling set by this final rule.

II. Mandatory Nutrition Labeling

FSIS requires food manufacturers to obtain prior approval for the content and design of labeling for meat and poultry products before the products may be marketed. FSIS permits and encourages voluntary nutrition labeling using formats set forth in Agency policy memoranda. Many processed, packaged meat and poultry products currently bear nutrition labeling. FSIS requires manufacturers to provide nutrition data to substantiate nutrition claims. Additional information, when necessary to facilitate consumer understanding of these claims, is required.

NAS recommended that FSIS promulgate regulations which would require nutrition labeling for most packaged foods under FSIS's jurisdiction, including institutional-size packages and commodities distributed through USDA food programs, and the 20 to 30 top items of fresh/frozen meat and poultry products. NAS suggested that values for the latter be provided by using point-of-purchase information developed from data base values.

FSIS's rulemaking activities addressed several issues surrounding mandatory nutrition labeling, such as: (1) Statutory authority, (2) exemptions from mandatory nutrition labeling, and (3) voluntary nutrition labeling for single-ingredient, raw meat and poultry products.

1. *Statutory Authority.* In the proposed rule, FSIS stated that it had statutory authority to require nutrition labeling based on the Secretary of Agriculture's determination that meat and poultry products, other than single-ingredient, raw products, would be misbranded in the absence of such information under section 1(n) of the FMIA (21 U.S.C. 601(n) (1)) and section 4(h) of the PPIA (21 U.S.C. 453 (h) (4)).

There was considerable opposition to mandatory nutrition labeling from food manufacturers and trade associations. Much of the opposition centered around anticipated increased costs. These commenters indicated that they preferred a strictly voluntary program, citing that supply and demand in the marketplace would provide the nutrition information wanted by consumers.

FSIS has concluded that consumers should be provided nutrition labeled products to the extent possible for all foods. Because the nutrient values of single-ingredient, raw meat and poultry products are not modified through various stages of preparation, such as cooking and heat processing, FSIS believes that consumers have reasonable expectations as to the nutritional qualities of such products. Therefore, FSIS is establishing mandatory nutrition labeling for most processed meat and poultry products, such as pumped turkey, chicken franks, corned beef and meat burritos. FSIS addresses cost concerns in the following section with provisions for a small business exemption and allowance for the use of data bases.

2. *Exemptions.* Many comments on the Agency's November 1991 proposal supported the need for nutrition labeling of meat and poultry products, but had concerns about the absence of an exemption from mandatory nutrition labeling for small businesses for which the cost impact may be excessive. Therefore, FSIS published a supplemental proposed rule in the March 25, 1992, **Federal Register**, which asked for comments on small business exemptions and on the use of data bases and recipe analyses using data bases. In the supplemental proposal, FSIS sought input on the appropriate criteria for determining a small business exemption for meat and poultry product manufacturers, such as annual sales by dollars, pounds of product, or units of product, and the relationship between the level of exempted meat and poultry products.

On April 21, 1992, FSIS published a notice in the **Federal Register** (57 FR 14499) asking for participation in three public forums on the small business exemption issues raised in the March 25 supplemental proposal. Forum participants were asked to focus on specific issues regarding viable criteria for a small business exemption, the feasibility of compliance with various exemption criteria, and the effect of specific exemption criteria on nutrition labeling of the total food supply. Participants were free to also comment on other relevant issues relating to a small business exemption.

Public comments have indicated that, without an exemption, the cost burden for small businesses would be excessive. Some manufacturers have contended that unless an exemption is established for meat and poultry products, they will be forced out of business or will be forced to drop unprofitable product lines. These manufacturers further stated that their volume of sales or the size of their product lines do not make it feasible for them to incur the additional costs of nutrition labeling.

The majority of trade association and industry representatives responding to the supplemental rule advocated a small business exemption based on pounds of product, with 100,000 pounds as the suggested amount. Also, most commenters favored an exemption that would be implemented on a product-by-product basis to allow a company to stay diverse and to encourage production of unique and innovative products.

Numerous commenters also suggested that each official establishment be considered a separate business. Many trade associations and industry comments defined a product as one that is approved on a single label request. However, identical products with different weights would be considered the same product. The majority of comments suggested that the daily production records be used to evaluate a company's eligibility.

In addition, commenters suggested that an average of 2 years of data be used to establish eligibility. Numerous commenters suggested that the time period allowed to implement the nutrition labeling requirement, when a company exceeds the exemption limits, should be 6 months to 1 year.

In May 1992, public meetings were held in Kansas City, MO, Atlanta, GA, and San Francisco, CA. At the Kansas City forum, the consensus of the group was that the exemption should be based on pounds of product. The most important factor in favor of the pounds per product option is that a product will be exempted based on each product's contribution to the diet; the level of the exemption may be tied directly to the percentage of the diet that may not be nutrition labeled. Furthermore, each exempted product is likely to be a small part of an individual's annual diet.

In Atlanta, the concept of a unit-based exemption was introduced. The unit concept is similar to the pound-per-product option and may be better for FDA-regulated products because of their wide variation in weight.

In San Francisco, a representative of the Small Business Administration suggested using an exemption that included a pound/unit concept in combination with the small business definition of 500 employees or less. The majority of people attending the meeting contended the exemption should be based on pounds and/or units.

FSIS believes an exemption for small business is necessary because mandatory nutrition labeling requirements will create undue economic hardship and serve as a disincentive for development of more nutritious food products. Furthermore, the burden of mandatory nutrition labeling may force some small firms to drop product lines that would become unprofitable because of the cost of nutrition labeling and eventually force some small firms out of business. Therefore, after reviewing comments received in response to the 1990 amendment proposal, comments at the nutrition labeling hearings, the public forums held for the small business exemption, and written comments supplied to the Agency, FSIS is establishing a small business exemption for meat and poultry processing firms based on the volume of production in combination with the number of employees working at a firm. To qualify for the small business exemption, a processor must produce less than the annual production poundage level of a single food product and must employ no more than a specified number of employees. For purposes of the small business exemption, a "food product" is defined as a formulation, not including distinct flavors which do not significantly alter the nutritional profile, sold in any size package in commerce.

FSIS evaluated several options in establishing a poundage limit for the small business exemption, as discussed in the Agency's FRIA. This evaluation was based on two objectives: (1) Setting the limit high enough so that the risk that any small business would have to close would be minimal, and (2) setting the limit low enough so that the maximum volume of total production would bear nutrition labeling. FSIS believes that a maximum annual production poundage level between 100,000 and 250,000 pounds appears to best satisfy these two stated objectives.

Accordingly, FSIS has determined that the cutoff for the annual production level should be 100,000 pounds, phased in over a 3-year period. The 3-year phase-in period will minimize the impact of compliance costs to the industry, while also minimizing the impact of additional purchasing costs to consumers. The maximum annual production poundage level is set at 250,000 pounds per food product for the first year of implementation of nutrition labeling, lowered to 175,000 pounds per food product for the second year of implementation, and lowered finally to 100,000 pounds per food product for the third and subsequent years. The 3-year phase-in period ultimately achieves the 100,000-pound limit suggested by industry and trade association representatives. In addition, FSIS estimates an average food product line has a 3-year life. Therefore, the 3-year phase-in period will accommodate the many firms that will be relabeling their products during the normal course of business because of changed formulations.

The limit on the number of employees at a firm is set at 500 or fewer employees, which is the Small Business Administration's definition of a small meat or poultry processing firm. This approach will allow the Small Business Administration to assist in determining which firms would qualify for exemption based on the number of employees.

For purposes of a small business exemption, FSIS defines "business" as a single-plant facility or a company that owns multiple facilities. Although most meat and poultry firms are single-plant facilities, a significant number of firms are multi-plant companies. These multi-plant companies tend to make labeling decisions for all facilities under their ownership or management in a centralized manner. The qualification of a multi-plant company for exemption from nutrition labeling entails the total annual production and the total number of employees for all facilities under that multi-plant company, not for each individual facility. Thus, if a multi-plant company as a whole meets both criteria set forth in the small business exemption, all facilities under that centralized company may be exempt from nutrition labeling. Conversely, if the multi-plant company does not meet both criteria in the small business exemption, no facility under that company qualifies for exemption from nutrition labeling.

Given this combination approach for exemption from nutrition labeling, FSIS estimates that over 90 percent of all meat and poultry products, under the mandatory nutrition labeling provisions, will bear nutrition labeling after the 3-year phase-in, when the maximum annual production level has reached 100,000 pounds. FSIS further expects, that nutrition labeling will be included on as much as 99 percent of all nationally distributed meat and poultry products available to consumers through supermarkets. Again, this figure takes into account all products that are regulated under the mandatory nutrition labeling regulations, and do not include single-ingredient raw meat and poultry products that are under voluntary nutrition labeling.

In its November 1991 proposal, FSIS proposed to exempt from nutrition labeling foods used for further processing. For very small packages (less than ½ ounce) and other than consumer-size packages, FSIS proposed to allow nutrition information to be provided by labeling means other than a nutrition panel on the package.

Although there were relatively few comments addressing this issue, the majority of those that did comment on exemptions supported a blanket exemption for foods used in further processing and other than consumer-size packages.

FSIS believes that there is little value in requiring nutrition information where the consumer will not see it. Since other than consumer-size packages can be purchased by the consumer at the retail level, FSIS believes it is more appropriate to exempt products that are not for sale to consumers, regardless of size, and allow industry to determine when the product is to be used for further processing and not to be sold, at that point, to consumers. (The term "consumers", as used throughout this document refers only to household consumers.) Since consumers will not see the nutrition information on products used for further processing or products that are not for sale to consumers, these products are exempt from nutrition labeling.

For very small packages, some commenters recommended a blanket exemption, while others recommended an increase in the net weight for small package exemptions. Several commenters recommended that FSIS follow FDA's definition for very small packages (i.e., surface area available to bear labeling of less than 12 square inches). FSIS believes that it is appropriate to retain the definition of very small packages as individually wrapped packages of less than ½ ounce net weight. The Agency does not currently require packages of meat or poultry products weighing less than ½ ounce to bear a net weight statement (9 CFR 317.2(h)(9)(ii) and 381.121(c)(9)(ii)). In order to provide consistency with this net weight labeling policy, FSIS is adopting the proposed definition of very small packages as individually wrapped packages of less than ½ ounce net weight. However, since these products are such an insignificant part of the diet, FSIS is exempting very small packages from nutrition labeling requirements, provided that no nutrition claim is made on the labeling. If a nutrition claim is made on the label of very small packages, all nutrition labeling requirements must be satisfied by printing the information on the labeling.

Based on comments it received on its proposal, FDA concluded that there was adequate justification for allowing some flexibility for food in an intermediate size package group of between 12 and 40 square inches. In this intermediate size package range, FDA is allowing for the use of a linear format, making the daily reference values (DRV's) optional, allowing for abbreviations, and allowing for required information to appear on other label panels adjoining the principal display panel or the information panel. FSIS has reviewed FDA's summary of the comments received on this issue, and agrees that there may be situations that warrant a modified nutrition label. Accordingly, FSIS will allow a modified nutrition label for packages with a total surface area available to bear labeling of 40 or less square inches. In addition, on a case-by-case basis, FSIS will consider allowing a modified nutrition label for packages larger than 40 square inches that have a surface area which precludes the presentation of the full nutrition label.

Numerous commenters raised the issue of custom services and were concerned about the status of these services with respect to nutrition labeling products. FSIS has determined that custom services, such as custom slaughter or custom processing, should be exempt from nutrition labeling requirements since such services are performed solely for individuals.

Several commenters stated that products intended for export should be exempt from nutrition labeling requirements. Such products are not covered under this final rule because they are labeled according to the requirements of the country where the product is to be exported. This final rule sets forth this exception to mandatory nutrition labeling.

Although the FSIS proposal did not specifically address the issue of food products served in restaurants, the Agency did receive several comments from trade associations and retailers. Restaurant menus generally do not constitute labeling or fall within the scope of these regulations.

FSIS has historically provided for certain retail exemptions, as prescribed in 9 CFR 303.1 and 381.10. However, the adulteration and misbranding provisions of the FMIA and PPIA, as well as related regulations, still apply to such retail exempted product. FSIS has determined, based on experience and on comments, that it would be impractical to enforce nutrition labeling requirements on products prepared or served at retail. In addition, FSIS has concluded, based on review of National Food Consumption Survey (NFCS) data, the average person's diet consists of an insignificant proportion of ready-to-eat, retail packaged or processed products.

Accordingly, FSIS is exempting from mandatory nutrition labeling (1) ready-to-eat products, such as sliced bologna, that are packaged or portioned at a retail store or similar retail-type establishment; and (2) multi-ingredient products, such as sausage, that are processed at a retail store or similar retail-type establishment, provided the labels or the labeling of these products bear no nutrition claims or nutrition information.

FSIS anticipates that most meat and poultry products in gift packs will fall under the small business exemption. FSIS also believes that gift packs play a very minor role in the overall diet. Although FSIS does not agree with those commenters who stated that gift packs should be exempt from nutrition labeling, this final rule provides that nutrition information for gift packs may be shown at a location other than on the gift pack label, unless a nutrition claim is made on the labeling of such products. For example, nutrition information may be provided on a package insert.

3. *Voluntary Nutrition Labeling.* FSIS proposed to permit voluntary nutrition labeling on single-ingredient, raw meat and poultry products, including those that have been previously frozen. Products such as ground beef, chicken breasts, and whole turkeys would be in the voluntary program. Under the proposed rule, manufacturers electing to provide nutrition information on the label of these products would be subject to all requirements of the mandatory nutrition labeling program, except that nutrition labeling for the voluntary program could be declared on the basis of "as consumed" or "as packaged", rather than required to be declared on an "as packaged" basis as is the case for products under the mandatory nutrition labeling program.

Several commenters requested clarification of whether single-ingredient, raw kosher meat and poultry products would be included in the voluntary program. These products are considered to fall within the definition of single-ingredient, raw products, and, thus, are included in the voluntary program. Commenters tended to support a voluntary program similar to FDA's voluntary program for raw fruit, raw vegetables, and raw fish. After reviewing the various comments received, FSIS believes that a voluntary nutrition labeling program for single-ingredient, raw meat and poultry products is the best approach.

Commenters supported the Agency's proposal to incorporate point-of-purchase materials in the voluntary program. Examples of the use of point-of-purchase materials to display nutrition information may include large placards (e.g., wall posters, signs, and aisle hangings). The nutrition

information may be supplemented by videos, live demonstrations or other media. If a nutrition claim is made on point-of-purchase materials that are labeled under the FMIA and the PPIA, all of the requirements of the mandatory nutrition labeling program apply. However, if only nutrition information—and not a nutrition claim—is supplied on point-of-purchase materials: (a) The requirements of the mandatory nutrition labeling program, apply but the nutrition information may be supplied on "as packaged" or "as consumed" basis; (b) the listing of DRV's is voluntary; and (c) the point-of-purchase materials are not subject to any of the format requirements. FSIS will not require the listing of DRV's on point-of-purchase materials which do not make nutrition claims because there will be limited space in grocery stores and supermarkets to display such nutrition information. Also, the Agency does not believe there is one most effective format for the presentation of nutrition information in point-of-purchase materials. Currently point-of-purchase nutrition information materials have many different formats. The Agency is not aware of any studies that show one format to be more effective than another.

FSIS proposed to survey food retailers on actions taken to provide consumers with nutrition information on products described in the voluntary program. FSIS will survey for "significant participation" rather than follow FDA's review of "substantial compliance" of the voluntary guidelines. Because FSIS does not have a statutory mandate as provided to FDA under the NLEA, FSIS proposed different terminology to refer to its review of the voluntary program. FSIS will follow FDA's planned 2-year evaluation cycle of the voluntary program, and will issue its first report of survey findings on the voluntary program by May 1995. FSIS initially proposed to implement both the voluntary and the mandatory nutrition labeling programs in May of 1993. However, FSIS has delayed the effective date of the nutrition labeling programs until 18 months from publication of this final rule. Therefore, FSIS will not begin surveying for significant participation until the effective date of this final rule. FSIS will reevaluate for significant participation every 2 years thereafter. If the Agency determines, during any evaluation of its voluntary guidelines, that significant participation does not exist, the Agency will initiate proposed rulemaking to determine whether it would be beneficial to require nutrition labeling on single-ingredient, raw meat and poultry products. The guidelines will remain in effect, however, as long as significant participation exists.

Individual stores selected for evaluation of the guidelines will be found to be participating at a significant level if (1) the store provides nutrition labeling information for at least 90 percent of the major cuts of single-ingredient, raw meat and poultry products that it sells, such as those listed in Table 1, including those that have been previously frozen; and (2) nutrition labeling information is in accordance with the guidelines described in the regulations.

FSIS will use a representative sample of stores to obtain the information necessary to assess participation. The distribution of the sample of stores shall cover all chain companies and a representative sample of independent companies. FSIS further proposed that significant participation by food retailers exists if at least 60 percent of the companies that are evaluated are participating in accordance with the guidelines.

There were few comments addressing the proposal for measuring significant participation. Several commenters supported the Agency's proposal, while those that disagreed with the proposal did not support measuring for significant participation. Two consumer groups that disagreed with the proposal expressed a different viewpoint, i.e., the Agency should require a higher percentage of participation than the proposed 60 percent.

FSIS believes it is important to provide nutrition information to consumers and, to the extent possible, harmonize with FDA's voluntary program for raw fruit, raw vegetables, and raw fish. To meet the 60 percent criterion, over half of the covered stores will provide nutrition information. In addition, FSIS believes that, by allowing for the use of point-of-purchase materials, retailers will be able to provide consumers with the necessary nutrition information. Therefore, FSIS is adopting the proposed standard for significant participation.

The FSIS proposal identified 45 major cuts of meat and poultry that would be used to measure significant participation in the voluntary program and requested comments on the list. Very few commenters addressed this issue. However, those that commented generally supported the proposed list. One commenter that generally disagreed with the proposed list suggested that the list omitted several of the more popular, fattier cuts and included leaner, less popular cuts of meats. FSIS attempted to identify representative cuts based on USDA nutritional studies, Poultry Nutri-Facts and Meat Nutri-Facts programs. The list in no way restricts retailers from providing additional nutrition information on other cuts of meat and poultry. FSIS encourages retailers to provide nutrition information on other cuts of meat and poultry to meet changing consumer needs.

One company requested that necks and giblets be excluded from the whole bird nutrient profile listing, stating that consumers frequently do not prepare these items nor do they consume them as part of the bird. In addition, it was requested that, at the manufacturer's option, the whole bird nutrient profile for turkeys be listed as white and dark meat.

Manufacturers currently label turkeys with two nutrient panels—one for white meat and one for dark meat. FSIS believes it is reasonable to exclude the necks and giblets from the whole bird when listing the nutrient profile. FSIS will permit manufacturers to continue the option of labeling turkeys with two panels. These minor revisions are reflected in Table 1 and in the final rule.

TABLE 1.—MAJOR CUTS OF MEAT AND POULTRY.

1. Whole Chicken [1]
2. Chicken Breast
3. Chicken Wing
4. Chicken Drumstick
5. Chicken Thigh
6. Whole Turkey [2]
7. Turkey Breast
8. Turkey Wing
9. Turkey Drumstick
10. Turkey Thigh
11. Beef Chuck Blade Roast
12. Beef Loin Top Loin Steak
13. Beef Rib Roast Large End
14. Beef Round Eye Round Steak
15. Beef Round Top Round Steak
16. Beef Round Tip Roast
17. Beef Chuck Arm Pot Roast
18. Beef Loin Sirloin Steak
19. Beef Round Bottom Round Steak
20. Beef Brisket (Whole, Flat Half, or Point Half)
21. Beef Rib Steak Small End
22. Beef Loin Tenderloin Steak
23. Ground Beef Regular, w/o added seasoning
24. Ground Beef Extra Lean, w/o added seasoning
25. Pork Loin Chop
26. Pork Loin Country Style Ribs
27. Pork Loin Top Loin Chop Boneless
28. Pork Loin Rib Chop
29. Pork Spareribs
30. Pork Loin Tenderloin
31. Pork Loin Sirloin Roast
32. Pork Shoulder Blade Steak
33. Pork Loin Top Roast Boneless
34. Ground Pork
35. Lamb Shank
36. Lamb Shoulder Arm Chop
37. Lamb Shoulder Blade Chop
38. Lamb Rib Roast
39. Lamb Loin Chop
40. Lamb Leg (Whole, Sirloin Half, or Shank Half)
41. Veal Shoulder Arm Steak
42. Veal Shoulder Blade Steak
43 Veal Rib Roast

45.	Veal Cutlets

[1] Without neck and giblets.
[2] Without neck and giblets. Separate nutrient panels for white and dark meat permitted as an option.

III. Nutrition Label Content

The NLEA mandates that the amount of the following food constituents be included on the labeling of nonexempted food products: Calories derived from any source, calories derived from the total fat, total fat, saturated fat, cholesterol, total carbohydrate, complex carbohydrates, sugars, dietary fiber, protein, and sodium. Also required to be included is any mineral, vitamin, or other nutrient required to be placed on the label or labeling before October 1, 1990, if the Secretary of Health and Human Services (HHS) determines that such information will assist consumers in maintaining healthy dietary practices. The NLEA allows FDA, by regulation, to add other nutrients to the list of nutrients that should be included on the labeling of foods subject to the NLEA, if this will help consumers to maintain healthy dietary practices. It allows FDA, by regulation, to remove nutrients required to be listed, if the Secretary of HHS determines that the information relating to the nutrient is not necessary to assist consumers in maintaining healthy dietary practices. The NLEA specifies that a simplified nutrition label format is to be used when a food contains insignificant amounts of more than one-half of the nutrients required to be listed.

In its November 1991 proposal, FSIS proposed to establish a list of 15 required nutrients which are: Calories, calories from total fat, total fat, saturated fat, cholesterol, total carbohydrate, complex carbohydrate, sugars, dietary fiber, protein, sodium, vitamin A, vitamin C, calcium, and iron. In addition, FSIS proposed to adopt FDA's proposed list of nutrients as mandatory or voluntary components of nutrition labeling, definition of nutrients, definition of insignificant amounts, and increments for declaring nutrients, in the interest of harmonizing with FDA. FSIS and FDA received numerous comments on these issues. Both agencies reviewed and discussed all comments, and after consideration, based their decisions regarding the list of nutrients on the agencies' discussion of comments. The following discussion addresses comments received concerning various nutrients.

1. *Saturated fat.* In the proposal, FSIS defined saturated fat as the sum of lauric (C12), myristic (C14), palmitic (C16), and stearic (C18) acids. FSIS requested comments on the inclusion of stearic acid in the definition of saturated fat.

Most of the comments received on the definition of saturated fat supported excluding stearic acid, stating that the proposed definition would be detrimental to red meat products and would serve no health benefit to consumers. A manufacturer supporting the inclusion of stearic acid in the definition of saturated fat stated that it has not been confirmed that stearic acid lowers serum cholesterol.

FDA also received a number of comments concerning the definition of saturated fat. There is substantial evidence that diets low in saturated fatty acids are associated with decreased levels of blood cholesterol, reduced risks of coronary heart disease and atherosclerotic disease and may help to lower total fat intake, which may be associated with risks of cancer and obesity. For these reasons, FSIS and FDA agreed with the comments supporting the definition of saturated fat as the sum of all fatty acids, including stearic acid, without double bonds. Although the definition for saturated fat includes stearic acid, a near consensus has been reached that stearic acid does not have the same serum cholesterol-raising effect as the three other saturated fatty acids—myristic, palmitic, and lauric acids. To provide consumers with factual information concerning saturated fats that do not have a cholesterol-raising effect, FSIS is allowing for the voluntary declaration of stearic acid as a subcomponent of saturated fat.

2. *Dietary fiber.* Food manufacturers and trade associations strongly objected to requiring the declaration of dietary fiber content. These commenters contended that, because meat and poultry products are generally not meaningful sources of dietary fiber, disclosure would be of limited value to consumers.

While whole muscle cuts may contain no dietary fiber, FSIS believes that some breaded and meal-type products may contain substantial amounts of dietary fiber. FSIS is requiring the declaration of total dietary fiber content, based on the well documented role of dietary fiber in maintaining normal bowel function. Different physiological effects are associated with soluble and insoluble dietary fibers, and consumers have expressed an interest in knowing these types of fibers in foods. However, no quantitative guidelines for daily intakes of soluble and insoluble fiber components have been provided. Therefore, FSIS is permitting the voluntary declaration of insoluble and soluble fiber components unless a nutrient content claim on fiber is made.

3. *Total carbohydrate.* FSIS proposed to define total carbohydrate to exclude dietary fiber. Because dietary fiber includes components of carbohydrate that cannot be digested by humans, the proposed definition of total carbohydrate did not include the components of carbohydrate that generally do not contribute calories to the diet. One comment stated that there was no justification for excluding dietary fiber from total carbohydrate values.

Based on comments, FSIS and FDA concluded that excluding dietary fiber from carbohydrate is inconsistent with established methods of reporting food composition, confuses the issue of calculating energy content, and will decrease consumer understanding of label information. Therefore, dietary fiber is included in the definition of total carbohydrate.

4. *Complex carbohydrate and sugars.* Food manufacturers and trade associations opposed the mandatory listing of complex carbohydrate and sugars (including sugar alcohols) on the label. These commenters stated that in most meat and poultry products, complex carbohydrate and sugars are present in small amounts or not at all.

In the interest of harmonization with FDA, FSIS is requiring the declaration of grams of sugars. Additionally, FSIS is limiting the definition of sugars to free mono- and disaccharides.

FSIS proposed that complex carbohydrate be defined as the sum of dextrins and starches. Thus, complex carbohydrate, as defined, includes those carbohydrate components that contain 10 or more saccharide units (exclusive of dietary fiber).

There was opposition to the proposed definition of complex carbohydrate. One manufacturer commented that excluding dietary fiber from the definition of complex carbohydrate has no scientific rationale, since dietary fiber is, by chemical composition, a complex carbohydrate. Several commenters were concerned that currently there is insufficient methodology for determining sugars and complex carbohydrates.

FSIS believes that the inclusion of dextrins and saccharide units of 10 or more within the definition of complex carbohydrate may inappropriately classify the relatively low molecular weight carbohydrates in some nutritive sweeteners as complex carbohydrate.

Additionally, from a compliance perspective, available and widely used laboratory methods provide for the analysis of carbohydrate in foods in a manner that may not be sufficiently specific for regulatory purposes.

Based on review of the comments submitted, FSIS concurs with FDA that it is more appropriate to replace the term "complex carbohydrate" with the term "other carbohydrate" which would be defined as the difference between total carbohydrate and the sum of dietary fiber and sugars, or if sugar alcohol is declared, the difference between total carbohydrate and the sum of dietary fiber, sugars, and sugar alcohol. In harmonization with FDA, FSIS is allowing for the declaration of other carbohydrate on a voluntary basis.

FSIS proposed to define "sugars," including sugar alcohol, as free mono- and oligosaccharides (and their derivatives) that contain four or fewer saccharide units. This definition includes tri- and tetrasaccharides. Most of the comments on this issue objected to the proposed definition of sugars, stating that sugars should be defined to include only mono- and disaccharides. One opposing commenter stated that the definition differed from that used by Canada, the Codex Alimentarius Commission and the European Economic Community. Two commenters suggested that including sugar alcohols in the definition of sugars is inappropriate because sugar alcohols do not have the nutritional and metabolic effects of sugars, such as glucose.

FSIS is aware that the proposed definition differs from that used by Canada, the Codex Alimentarius Commission, and the European Economic Community, all of which limit the definition of sugars to mono- and disaccharides. FSIS agrees that it is more appropriate to exclude sugar alcohols from the definition of sugars. FSIS is allowing, on a voluntary basis, the separate declaration of the number of grams of sugar alcohols or, alternatively, if only one sugar alcohol is present in the food, the name of the specific sugar alcohol. If sugar alcohols are present but not listed, they are included in other carbohydrates. Declaration of sugar alcohols is mandatory when claims are made relative to sugar alcohols or to sugars when sugar alcohols are present.

5. *Protein.* FSIS proposed to require that the label for any food contain the statement "not a significant source of protein" immediately adjacent to the protein content regardless of the actual amount of protein present if the food (a) intended for adults and children 4 or more years of age, has a protein quality value that is a protein digestibility-corrected amino acid score of less than 20 expressed as a percent, (b) intended for children greater than 1 but less than 4 years of age, has a protein digestibility-corrected amino acid score of less than 40 percent of casein, or (c) intended for infants, has a protein quality, as measured by protein efficiency ratio, of less than 40 percent of the reference standard (casein).

Based on comments received, FDA concluded that the amino acid pattern for children 1 to 4 years of age should be the same as the amino acid reference pattern for 2- to 5-year old children. FSIS agrees, and is removing casein as a reference standard for foods intended to be for children older than 1 year but younger than 4 years of age.

One commenter stated that it was important to harmonize with FDA on protein quality. Another company opposed use of the statement "not a significant source of protein" citing that there is no evidence of protein malnutrition in the United States.

The Agency is retaining this requirement because there is a need to protect the consumer, especially a young child, from inadequate nutrition from the use of poor quality protein.

FSIS proposed that declaration of protein content calculated as a percent of the recommended daily intake (RDI) be voluntary for foods intended for consumption by adults and children 4 or more years of age unless a protein claim is made for the food. However, the Agency also proposed that nutrition labeling on foods intended for infants and children less than 4 years of age contain a mandatory statement of protein content expressed as a percent of the RDI.

The label reference value for protein for adults and children 4 or more years of age has been established as a DRV rather than a RDI because the label reference value for protein for this age group is now being based on percent of calories. However, because FDA did not propose DRV's for infants, children less than 4 years of age, pregnant and lactating women, the protein label reference values for these groups remain as RDI's.

One commenter recommended that protein expressed as a percentage of RDI be voluntary for all foods unless a protein claim is made. Another commenter disagreed stating that the mandatory listing of protein as a percent of RDI would provide consumers with knowledge of when protein requirements are met and also exceeded.

Because current evidence suggests that the diet typically within the U.S. provides for an adequate intake of protein of sufficiently high biological quality, FSIS is allowing but not requiring the voluntary declaration of protein content calculated as a percent of the DRV for foods represented for consumption by adults and children 4 or more years of age unless a protein claim is made for the food. Furthermore, the Agency is requiring that nutrition labeling on foods represented for use by infants and children less than 4 years of age contain a mandatory statement of protein content expressed as a percent of the RDI.

6. *Vitamins and minerals.* Public concern for thiamin, riboflavin, and niacin has lessened considerably in the last 20 years. The Agency received only one comment stating that these vitamins should be required. Therefore, the Agency is making the declaration of thiamin, riboflavin and niacin voluntary, unless a claim is made for them.

7. *Nutrient components.* FSIS and FDA received numerous comments on a variety of issues concerning nutrient components. Both agencies have carefully reviewed and assessed the comments and discussed the merit of these comments. Accordingly, FDA has made changes in its final rule published elsewhere in this issue of the **Federal Register.** FSIS is adopting the agreed upon changes since both agencies are committed to providing consumers with the most consistent food labeling system possible. The following tables list the voluntary and mandatory nutrient components.

TABLE 2.—MANDATORY/VOLUNTARY NUTRIENTS

Nutrients	Mandatory (M), Voluntary (V)	Core nutrient	Units	Increments rounding	Insignificant amount	Definition	Other
Calories	M	X	Calories	5 cal <=50 cal 10 cal >50 cal	<5 cal		May be listed on label as kilojules (k) or (energy) in addition to calories.
Calories from fat	M		Calories	5 cal <=50 cal 10 cal > 50 cal	<5 cal		
Calories from sat fat.	V		Calories	5 cal <=50 cal 10 cal > 50 cal	<5 cal		
Total Fat	M	X	gm	Nearest .5 gram below 3 grams nearest gram above 3 grams.	<.5 gm	Total lipid fatty acids	
Saturated Fat	M		gm	Nearest .5 gram below 3 grams nearest gram above 3 grams.	<.5 gm	Sum of all fatty acids without double bonds.	
Stearic Acid	V		gm	Nearest .5 gram below 3 grams nearest gram above 3 grams.	<.5 gm		
Polyunsaturated fat and monounsaturated fat.	V		gm	Nearest .5 gram below 3 grams nearest gram above 3 grams.	<.5 gm		
Cholesterol	M		mg	Nearest .5 mg	<2 mg		2–5 mg may state "Less than 5 mg".
Sodium	M	X	mg	5 mg <=140 mg 10 mg>140 mg	<5 mg		
Potassium	V		mg	5 mg <=140 mg 10 mg >140 mg	5 mg		
Total Carbohydrate.	M	X	gm	Nearest gram	<1 gm	All carbohydrates including dietary fiber.	
Dietary Fiber	M		gm	Nearest gram	<1 gm	Sum of soluble and insoluble fiber.	
Soluble Fiber	V		gm	Nearest gram	<.5 gm		
Insoluble Fiber	V		gm	Nearest gram	<.5 gm		
Sugars	M		gm	Nearest gram	<.5 gm	Sum of all free mono and disaccharides.	
Sugar Alcohols	V		gm	Nearest gram	<.5 gm	Sum of all approved sugar alcohols.	
Other Carbohydrates.	V		gm	Nearest gram	<.5 gm	All carbohydrates except sugars, sugar alcohols (if not declared), and dietary fiber.	
Protein	M	X	gm	Nearest gm	<1 gm	Voluntarily state as % of RDI or DRV, becomes mandatory for foods for infants and children less than 4 years.	
Vitamin A	M		% RDI	Nearest 2% <=10% Nearest 5% > 10% <=50% Nearest 10% >50%	<2% RDI		
Vitamin C	M		% RDI	Nearest 2% <=10% Nearest 5% > 10% <=50% Nearest 10% >50%	<2% RDI		
Calcium	M		% RDI	Nearest 2% <=10% Nearest 5% > 10% <=50% Nearest 10% >50%	<2% RDI		
Iron	M		% RDI	Nearest 2% <=10% Nearest 5% > 10% <=50% Nearest 10% >50%	<2% RDI		

Note: All voluntary nutrients become mandatory if a claim is made regarding the nutrient or one of its subcomponents.

TABLE 3.— MANDATORY/VOLUNTARY RDI CHART

Nutrient	Mandatory (M), voluntary (V)	Unit of measurement	RDI
Vitamin A	M	International Units	5000
Vitamin C	M	Milligrams	60
Calcium	M	Gram	1.0
Iron	M	Milligrams	18
Vitamin D	V	International Units	400
Vitamin E	V	do	30
Thiamin	V	Milligrams	1.5
Riboflavin	V	do	1.7
Niacin	V	do	20
Vitamin B6	V	do	2.0

TABLE 3.— MANDATORY/VOLUNTARY RDI CHART—Continued

Nutrient	Mandatory (M), voluntary (V)	Unit of measurement	RDI
Folate	V	do	0.4
Vitamin B12	V	Micrograms	6.0
Biotin	V	Milligrams	0.3
Pantothenic Acid	V	do	10
Phosphorus	V	Gram	1.0
Magnesium	V	Milligrams	400
Zinc	V	do	15
Iodine	V	Micrograms	150
Copper	V	Milligrams	2.0

Notes:
- All voluntary nutrients are required if a claim is made regarding that nutrient.
- The declaration of all vitamins and minerals will be as a percent of the RDI.

IV. Nutrition Label Format

In its November 27, 1991, proposal, FSIS announced its intent to issue a separate proposed rule on format. At that time, FDA had initiated a pilot program to test alternative nutrition label formats. On July 20, 1992, FDA proposed to adopt a new nutrition label format. Its proposal was based on the findings of four consumer research studies, and other label research being conducted by industry. FDA described its intent in revising the current nutrition label so that the information included in the nutrition panel would enable consumers to understand its relative significance in the context of a total daily diet.

On August 28, 1992, FSIS issued a separate proposed rule adopting a standard format for use in presenting nutrition information on the labels of meat and poultry products. FSIS proposed to establish the CONTROL WITH DIETARY GUIDANCE or the CONTROL WITH RECOMMENDED DAILY INTAKE RANGE as the standard format. The Agency tentatively concluded that these formats would: (1) Enable consumers to select foods that fit into a healthier diet that meets their individual needs; (2) provide consumers with the most accurate information on which to base their dietary decisions; (3) promote and reinforce a nutrition education message that is familiar to consumers and well accepted by health professionals; and (4) allow the Agency flexibility to adapt to ever changing scientific findings without publishing new regulations. FSIS requested comments on whether the CONTROL WITH DIETARY GUIDANCE or the CONTROL WITH RECOMMENDED DAILY INTAKE RANGE format enables consumers to apply the nutrition information in the context of a total daily diet. FSIS also requested comments on certain label format elements, such as changes in terminology, graphic presentation, and highlighting.

To be consistent with FDA, FSIS proposed the use of an abbreviated format in its November 1991 proposal. The proposed abbreviated format was to be used if a meat or poultry product contained insignificant amounts of more than one-half of the nutrients required in the full nutrition label format. The term "insignificant amount" was proposed as meaning "that amount which may be rounded to zero in nutrition labeling."

Trade associations and food manufacturers expressed opposition to the requirements for use of an abbreviated format stating that virtually every meat and poultry product will have significant amounts of more than one-half of the required nutrients. Many commenters supported some type of shortened format for which meat and poultry products could qualify.

In the August 28, 1992, proposal on format, the Agency stated that it was unable to find meat or poultry products that would qualify for the proposed simplified format ("abbreviated" format was changed to "simplified" format). Therefore, FSIS did not propose FDA's simplified format. FSIS requested comments on a simplified format, with differing criteria for meat and poultry products. When any of the required nutrients, other than the core nutrients or food components, are present in insignificant amounts, FSIS proposed that they may be omitted from the tabular listing, provided that the following statement is included within the nutrition label: "Not a significant source of _____." The blank would be filled in with the appropriate nutrient or food component. In addition, at a minimum, the simplified format would include calories, total fat, total carbohydrate, protein, and sodium.

FSIS received 70 comments on the format proposal from trade associations (25), food manufacturers and distributors (22), consumers (5), colleges and universities (4), consumer advocacy organizations (3), foreign governments (2), professional organizations (2), a health promotion organization (1), and others (3).

Although there was some support for both the CONTROL WITH DIETARY GUIDANCE and the CONTROL WITH RECOMMENDED DAILY INTAKE RANGE formats, commenters thought, in general, that these formats needed testing prior to any consideration for adopting them. There was general agreement among those opposing FSIS's proposed formats that these formats do not meet the NLEA provision which requires that nutrition information be provided in a manner that is understandable and informative. (Although FSIS is not bound by the NLEA, as FDA is, nutrition labeling is a harmonization effort on the part of both agencies.)

Strong objections were voiced on the CONTROL WITH DIETARY GUIDANCE format, suggesting that the dietary guidance would be too general to be informative or would require too much label space. Further objections included: (1) Consumers would not have time to calculate the dietary guidance into meaningful information; (2) the dietary guidance offered no frame of reference; and (3) the order of ingredients should reflect the CONTROL format.

Those opposing the CONTROL WITH RECOMMENDED DAILY INTAKE RANGE format did not believe consumers would be able to apply the information to their individual needs. Many believed that nutrition education would be needed in order for consumers to understand this format, and that this format also utilizes too much label space.

Commenters opposed the CONTROL WITH DAILY GUIDE FOR MEN AND WOMEN format because they thought consumers would focus on one number for each nutrient and assume that this number would be right for them. This format was also criticized for not allowing space for other groups, such as children.

Many commenters voiced support for the CONTROL format. These

commenters cited simplicity, minimal label cutter, and consumer familiarity to support their viewpoint. Several companies commented that the CONTROL format should be required as a base, but allow the expansion of the CONTROL format to include recommended daily intake ranges and expanded dietary guidance on a voluntary basis.

There was some support for the CONTROL/DRV, PERCENT DV WITH DRV, and PERCENT DV WITHOUT DRV formats. Commenters contended that the DRV's represent an estimate of the daily needs for the average consumer or that DRV's provide consumers a framework based on the total daily diet.

No comments supported the ADJECTIVE, HIGHLIGHTING, and GROUPING formats.

Commenters repeatedly stressed that, whatever format is ultimately selected, it is critical for FSIS and FDA to adopt a uniform format. They believed that consistency in labeling format should be the main concern to achieve the ultimate goal of providing useful nutrition information to consumers for all foods.

FSIS and FDA have extensively reviewed and discussed all comments submitted, and have determined that the PERCENT DV WITH DRV format best meets the intent of the NLEA and serves the needs of consumers. The required elements of the nutrition label format include: the fourteen mandatory nutrients and their quantitative amounts, the percent of the daily value based on a 2,000 calorie diet, the DRV's for both a 2,000 calorie and a 2,500 calorie diet, and caloric conversion information. Both FSIS and FDA believe that establishing one uniform format for all foods is in the consumers' best interest. Accordingly, FSIS is adopting all of the mandatory and voluntary elements of the PERCENT DV WITH DRV format.

Commenters expressed strong support for the simplified format with differing criteria for meat and poultry products. Commenters agreed that the FSIS proposed simplified format was appropriate for meat and poultry products. Therefore, FSIS is adopting the simplified format as proposed.

V. U.S. Recommended Daily Allowances

In its November 1991 proposed rule, FSIS proposed to require that daily reference values (DRV's) become part of nutrition labeling. FSIS also proposed to adopt FDA's proposed format for the "daily value", as presented in the proposed 21 CFR 101.9(c)(12)(i).

The majority of commenters opposed the use of DRV's on the label because they believe that:

(1) DRV's are based on an extremely high calorie intake that is not a representative sample of the average population;

(2) DRV's would only serve to confuse consumers;

(3) DRV's do not have universal acceptance by health professionals, and are not in common usage by the scientific and academic communities;

(4) DRV's will not apply uniformly to all consumers due to variations in individual diets; and

(5) DRV's would clutter the food label.

Those commenters that supported the use of DRV's on the label believe that using DRV's gives consumers a gauge for the nutrient amounts on the label and aids consumers in understanding how individual foods fit into the total diet. Most of the supporters of the DRV concept believe that its use should be voluntary.

There were varying opinions among commenters regarding the Agency's proposal to head the list of vitamins and minerals with the single term "Daily Value." Some commenters were concerned that the term "Daily Value" could be interpreted as goals to be achieved rather than reference levels. Other commenters agreed with the FSIS proposal, while others said Daily Value intakes should be eliminated or postponed until they are better defined, justified by a consensus of the scientific community, and understood by industry and consumers. The terms "Percent of Daily Values" and "Reference Value" were suggested as alternatives to the proposed "Daily Value" term. Some commenters thought "Daily Value" should be voluntary and recommended that it be allowed as an additional column in the main nutritional panel.

The majority of the commenters opposed the adoption of the Recommended Daily Intakes (RDI's) and supported the continued use of the U.S. Recommended Daily Allowances (RDA's). Commenters opposed the adoption of RDI's because they believe RDI's would mislead and confuse consumers and understate or ignore the nutritional needs of many population groups. Some commenters suggested that the method used to derive the RDI's and DRV's undermines the usefulness and effective accuracy of the nutrition panel for most consumers. Another commenter believes that the 2,350 calories level would be misinterpreted by consumers as goals to achieve.

Those commenters supporting the continued use of U.S. RDA's believe that U.S. RDA's are currently accepted as the established and up-to-date reference standard for vitamins and minerals for healthy Americans. Also, there is a history of recognition and use of the U.S. RDA's by consumers.

Some commenters concurred with FSIS's decision to adopt FDA's RDI's and stated that the current U.S. RDA's are the appropriate standards to use in developing the RDI's. The commenters suggested that the age adjusted mean is a reasonable method for establishing the level for each nutrient and food component. Commenters also stated that the five sets of RDI's that FDA proposed should provide adequate standards for foods specifically designed for infants, children, and pregnant and lactating women.

Several commenters addressed the issue of updating RDI's and RDA's. The commenters pointed out that the current proposal makes no provision for incorporating a mechanism to update the RDI's at regular intervals as the population changes and as new evidence for recommended nutrient requirements (RDA's) changes. Another commenter supported updating of the U.S. RDA's to reflect the 10th edition of the RDA's.

Most of the commenters suggested that FSIS and FDA be consistent in the use of RDI's and DRV's.

FSIS will parallel FDA and adopt the format for the "Daily Value." "Daily Value" will be the means of placing the nutrition information on the label in the context of a total daily diet. As the FDA and FSIS have worked to standardize the nutritional labels under their respective jurisdictions, it remains in the interest of consumers that FSIS and FDA be consistent.

After extensive discussions over format, the Administration decided that the DRV's should be shown for both a 2,000 calorie diet and a 2,500 calorie diet. For the 2,000 caloric level the DRV's are: 65 g fat, 20 g saturated fat, 300 mg cholesterol, 2,400 mg sodium, 300 g total carbohydrate and 25 g fiber. For a 2,500 caloric level the DRV's are: 80 g fat, 25 g saturated fat, 300 mg cholesterol, 2,400 mg sodium, 375 g total carbohydrate and 30 g fiber.

VI. Serving Sizes

To make nutrition information on food labels meaningful, the NLEA requires FDA to establish standards to ensure that nutrition labeling provides the serving size which is an amount customarily consumed and is expressed in a common household measure appropriate to the food. NAS recommended that FDA and FSIS jointly establish sizes for limited, broad categories of foods to help consumers

make product comparisons. NAS suggested basing them on standard serving sizes as specified by dietary guidance recommendations to make their use in educational programs less difficult and to permit consistency among serving sizes shown in dietary guidance material and on the food label. NAS also advocated a petition process for desired deviations from the serving size set by FDA and FSIS or for creation of different food subcategories with new serving sizes.

In its November 1991 proposal, FSIS proposed the following regulations specific to serving sizes:

(1) Creating Reference Amounts for serving sizes for 23 food Product Categories;

(2) Establishing guidelines for converting Reference Amounts to serving sizes;

(3) Defining serving sizes for meal-type products and food products in pieces or units;

(4) Requiring presentation of nutrition information based on serving size "as packaged" for the mandatory labeling program and allow nutrition information for single-ingredient, raw meat and poultry products to be declared "as packaged" or "as consumed" under a voluntary nutrition labeling program;

(5) Requiring the use of both common household and metric measures to declare serving size;

(6) Defining serving size and single-serving container;

(7) Establishing guidelines for declaring the number of servings per container;

(8) Requiring the use of serving size and Reference Amounts to evaluate nutrition claims; and

(9) Allowing for labeling applications for changes in Product Categories and Reference Amounts.

1. *Reference Amounts for serving sizes for 23 food Product Categories.* a. Product Category. Through the work of the Interagency Committee on Serving Sizes, FSIS proposed to establish 23 food Product Categories for meat products, and 22 food Product Categories for poultry products regulated by FSIS. These Product Categories would provide consumers with a uniform food labeling system that categorizes similar foods by the same reference standard. Each Product Category has an accompanying Reference Amount which is based on food consumption data. These Reference Amounts are to be used by food companies as the basis for determining the serving sizes for nutrition labeling of their products.

Opposition to this approach came from manufacturers who contend that all products should have a 1-ounce or 100-gram standard Reference Amount. Although FSIS discussed this option in the proposed rule, it was not the option proposed because:

(a) The NLEA requires that the serving size be based on the "customarily consumed amount";

(b) Consumers may not realize that multiplication is necessary to arrive at the consumed amounts; and

(c) FSIS seeks harmonization with FDA to allow ready product comparisons.

There was strong support from a variety of industry representatives, industry associations, cattle associations, consumer advocacy groups, and individuals in favor of retaining the proposed approach to serving sizes. These commenters believe that a single, uniform set of nutrition labeling regulations for all foods will be in the consumers' best interest, easiest to understand, and prevent consumer confusion.

b. Three-ounce serving size. Several consumer advocacy groups contended that a 3-ounce serving size for single-ingredient, raw meat and poultry products is too small and the data used to determine the serving size were seriously flawed. They believed that the serving size should be determined using only 1977–78 Nationwide Food Consumption Survey (NFCS) data.

FSIS has decided to retain the 3-ounce serving size for single-ingredient, raw meat and poultry products. This is supported by many commenters who believe it is appropriate from an educational standpoint, and it is based on realistic data on food consumption. Food consumption survey data, such as NFCS, provide objective estimates of amounts of food customarily consumed. The NFCS is nationally representative of the most comprehensive data on food consumption practices of the U.S. population that are available to the Agency. Additionally, the 3-ounce serving size for fresh meat and poultry products is supported by dietary recommendations and the work of the Interagency Committee on Serving Sizes.

c. Weight-loss products. Many producers of weight-loss products, which are part of a weight loss program, have asked to be allowed to develop their own serving sizes based on their program. FSIS believes that the serving sizes for all foods available to the retail consumer should be based on the Reference Amount, including those intended for weight-control or weight-reduction. However, the Agency believes that it is in the best interest of participants of a weight-control program, which provides product only through the program, to have labeling which is consistent with the program meal plan. Therefore, the Agency will allow these programs to have serving sizes based on their meal plan. To avoid any confusion with retail products, manufacturers of product that will be used only through weight-control programs will be required to label their products "for sale only through the _____ program." The blank will be filled in with the appropriate weight control program (e. g., Smith's Weight Control).

d. Specific changes to Reference Amounts and Product Categories. Many manufacturers and industry representatives expressed confusion concerning which Reference Amount would apply to their product. Also, commenters had questions about the examples used for specific product categories. Manufacturers will decide the intended use of their product(s), which in turn will determine the appropriate Product Category and Reference Amount (e. g., ham that is intended for use in sandwiches would fit under the Product Category "Luncheon Meats" with a Reference Amount of 55 grams). Examples listed under Product Category are not all inclusive or exclusive, and are provided to assist manufacturers in identifying the appropriate Product Category for their products. FSIS believes this clarification will alleviate most concerns along with a few changes made to Product Category examples in this final rule.

Other comments focused on the lack of a specific Product Category and Reference Amount or a change in the proposed Reference Amount. Comments were received requesting a change in the Reference Amount but were not accompanied by food consumption data. Therefore, no change is being made to the Reference Amount. Comments asking for Product Category changes for specific markets or foods for specific eating occasions will not be granted at this time (e.g., toddler finger foods and breakfast burritos). Labeling applications requesting Product Category or Reference Amount changes will be accepted after the final regulation is published.

Several comments requested a range rather than a fixed Reference Amount. FSIS encourages manufacturers to use the optional second column of nutrition values based on either 100 grams, 100 milliliters, or 1 ounce.

Comments requested different Reference Amounts for products which

are sold at retail and food service products which are served at restaurants, schools, and other such facilities. FSIS believes consumers would be confused by two different Reference Amounts for the same product regardless of where it is sold.

Some comments requested Reference Amount changes based on the mode of the NFCS data. These requests are being denied because all Reference Amounts were calculated based on the mean and the median "consumed serving size" (CSS). The mode of the CSS was determined not to be useful as the sole criterion for determining the Reference Amount because most food groups had two or more modes, and there usually was no obvious or rational basis to choose one over the other. However, the mode did provide additional guidance in determining the Reference Amount. Therefore, FSIS used all three values (i.e., the mean, median, and the mode) in determining the amount customarily consumed.

e. Volume vs. weight. Some commenters stated that all Reference Amounts should be expressed in grams. Some of the specific Product Categories originally expressed in volume-based Reference Amounts have been changed to weight-based Reference Amounts. However, the Agency does not agree that it is appropriate or desirable to do so for all Product Categories, including some of those specifically mentioned in comments. As explained above, when products within a Product Category differ widely in density, the use of a fixed gram Reference Amount would result in a serving size that is too large for some products in the category and too small for others, even though the volume amounts consumed are similar for all products within the category. For example, although the Reference Amount for "mixed dishes measurable with a cup" is 1 cup, the gram-weights of different types of products within the category differ widely (e.g., about 180 grams for chili with beans and about 225 grams for beef stew). Thus, in this final rule, FSIS uses weight-based Reference Amounts in most cases but is retaining volume-based Reference Amounts for a limited number of categories with products that vary greatly in density (e. g., mixed dishes measurable with a cup).

f. Foods that are Packed or Canned in Liquid. Foods such as canned meats may be packed in water, brine, or oil, but food consumption data have shown that the liquid is not customarily consumed. FDA received comments requesting that foods packed or canned in liquid bear nutrition labeling based on the drained solids. FSIS agrees with the commenters that the label serving size most meaningful for these products would be the serving size based on drained solids. Therefore, FSIS will require that the declaration of nutrient and food components for foods that are packed or canned in water, brine, or oil be based on the drained solids.

g. Labeling applications. FSIS shall allow labeling applications to be submitted to amend the Reference Amount and/or Product Category through the rulemaking process. Any such labeling applications for changes to the Reference Amount and/or Product Category for meat and poultry products would be submitted to the Director, Food Labeling Division, FSIS, with specific information supporting such use. The supporting information includes statements that (1) identify the Reference Amount and/or Product Category; (2) explain why the Reference Amount and/or Product Category is not false or misleading; and (3) describe the product and the form the product will be used in. Such labeling application is required to be signed by the applicant or by the applicant's responsible officer or agent.

Upon receipt and review of the labeling application and supporting documentation, FSIS will notify the applicant, in writing, that the labeling application is either being considered for further review or that the labeling application has been denied by the Administrator. If the Administrator summarily denies the labeling application, he or she would notify the applicant, in writing, as to the reason(s) for the denial, including why the proposed Reference Amount and/or Product Category was determined by FSIS to be false or misleading, and would afford the applicant an opportunity to submit a written statement by way of answer to the notification, and a right to request a hearing with respect to the merits or validity of the Administrator's decision to deny the use of the proposed Reference Amount and/or Product Category. If the applicant fails to accept the determination of the Administrator and files an answer and requests a hearing, and the Administrator, after review of the answer, determines the initial determination to be correct, the Administrator would file with the Hearing Clerk of the Department the notification, answer, and the request for hearing, which would constitute the complaint and answer in the proceeding, which would thereafter be conducted in accordance with the Department's Uniform Rules of Practice. The hearing would be conducted before an administrative law judge with the opportunity for appeal to the Department's Judicial Officer, who is delegated the authority to make the final determination for the Secretary. Any such determination by the Secretary will be conclusive unless, within 30 days after receipt of notice of such final determination, the applicant appeals to the United States Court of Appeals for the circuit in which the applicant has its principal place of business or to the United States Court of Appeals for the District of Columbia Circuit.

If the Administrator does not summarily deny the labeling application, he or she would publish in the **Federal Register** a proposed rule to amend the regulations to authorize the use of the Reference Amount and/or Product Category. The proposal would also summarize the labeling application, including where the supporting documentation could be reviewed. The Administrator's proposed rule would seek comments from consumers, the industry, consumer and industry groups, and other interested persons on the labeling application and the use of the proposed Reference Amount and/or Product Category. After public comment has been received and reviewed by the Agency, the Administrator will make a determination on whether the proposed Reference Amount and/or Product Category will be approved for use on the labeling. If the Reference Amount and/or Product Category is denied, the Agency would notify the applicant by letter of the basis for the denial, including the reason why the Reference Amount and/or Product Category was determined by the Administrator to be false or misleading. The applicant would have an opportunity to appeal this decision by instituting a proceeding which would be conducted under the same procedures specified above if a labeling application were summarily denied by the Administrator during the initial review. If the Reference Amount and/or Product Category is approved by the Administrator, the Agency would notify the applicant by letter and would also publish in the **Federal Register** a final rule regarding the approval of the Reference Amount and/or Product Category. The final rule would amend the regulations to authorize the use of the Reference Amount and/or Product Category in the labeling of meat and poultry products.

2. *Procedures for converting Reference Amounts to serving sizes.* As part of the Interagency Committee on Serving Sizes, FSIS fully participated in establishing the criteria for converting the Reference Amounts to serving sizes in common household measures. These procedures will help to assure

uniformity in the declared serving size within a Product Category and allow flexibility in the serving size to account for differing characteristics of diverse food products. The following are guidelines for converting Reference Amounts to Serving Sizes for: (a) Products in discrete individual units, (b) products in large discrete units that are usually divided for consumption, and (c) non-discrete bulk products.

a. Products in discrete individual units. FSIS proposed that serving sizes for products in discrete units be the number of units that most closely approximates the Reference Amount applicable to the product. Under this provision, if a unit weighs 67 percent or more, but less than 200 percent of the Reference Amount, serving size shall be one unit. If a unit weighs 200 percent or more of the Reference Amount, the manufacturer may declare the whole unit as one serving if the whole unit can reasonably be consumed at a single-eating occasion.

Several commenters opposed the lower limit of the proposal because a single-serve unit of many products in discrete units fall in the 50–67 percent range and one unit is customarily consumed. FSIS has decided to change the lower limit to >50 percent of the Recommended Amount Customarily Consumed (RACC). Products which are exactly 50 percent of the RACC will not be included because 50 percent is exactly half of the RACC. Therefore, two units of a product weighing 50 percent of the RACC per unit is exactly one serving.

Commenters also recommended that FSIS allow voluntary listing of nutrient contents per unit for products that come in discrete units (e.g., chicken nugget, chicken wing, cocktail frank), when the declared serving size of a multi-serving package is more than one unit. FSIS believes this would be beneficial for consumers, because many products in discrete units come in small units and consumers who consume one single unit would benefit from per-unit labeling.

b. Products in large discrete units that are usually divided for consumption. The proposal would require that the serving size for products in large discrete units (e.g., pizza) be the fractional slice of the food that most closely approximates the RACC. Commenters pointed out that the serving size may be 1/7 of the product. However, the product cannot be easily cut into 7 even slices; it can only be cut into fractions of multiples of 2 or 3. Therefore, FSIS will allow manufacturers to use 1/2, 1/3, 1/4, 1/5, 1/6, or higher fractions of multiples of 2 or 3. This does not include 1/28 because it involves a division by 7.

3. *Serving sizes for meal-type products.* In the proposed rule, FSIS defined meal-type products as any product that is intended for consumption by one person. There was strong support from commenters for nutrition labeling of meal-type products in their entirety. Because meal-type products are typically consumed by one person and make up the major portion of a meal, it is more meaningful to provide consumers with nutrition information on these products in terms of the entire product. A consumer will have nutrition information on exactly what he or she purchases and typically consumes. Therefore, the consumer will be able to evaluate how the product fits into his or her total diet.

FSIS will require nutrition labeling for meal-type products, based on the contents of the entire package. Meal-type products must also meet the definition of a single serving container. FSIS addresses the definitions of meal-type products elsewhere in this final rule with a provision for the use of nutrient content claims with meal-type products.

4. *Nutrition information based on serving size "as packaged" vs. "as consumed".* To maintain consistency with FDA's mandatory and voluntary nutrition labeling scheme, FSIS proposed to require nutrient values "as packaged" for products under the mandatory program with an option of also presenting "as consumed" values. Products under the voluntary program may list nutrient values on an "as consumed" or an "as packaged" basis. The preparation method used for the "as consumed" values must be clearly indicated on the package.

The Agency proposed that the RACC for products which require further preparation before consumption be the amount required to make one RACC of the prepared form. Commenters stated that they are unable to identify raw product serving sizes to produce the cooked RACC.

Therefore, FSIS has developed yields for Product Categories which contain products that require further preparation (e.g., bacon, raw meat and poultry cuts). These yields are based on yields used in the Nationwide Food Consumption Surveys (NFCS) and USDA Handbook #8. These yields will appear as an additional column in the RACC tables found in §§ 317.312(b) and 381.412(b). These yields will only be used for the determination of Reference Amounts.

Some commenters opposed the labeling of fresh or raw, ready-to-cook food products on an "as packaged" basis. They believe the labeling on an "as consumed" basis would allow consumers to directly compare ready-to-cook and ready-to-serve or heat-and-serve products. However, this would only be the case if the consumer prepared the fresh or raw, ready-to-cook product exactly as the manufacturer stated on the label. There are varieties of cooking methods that affect the nutrient values of food products differently. Therefore, there is no method to assure the accuracy or measure compliance of the nutrient values of a food labeled on an "as consumed" basis.

Several commenters stated that special case products (e.g., bacon, breakfast sausage, and raw marinated meat or poultry products) undergo extreme composition changes prior to consumption. If labeled "as packaged", these products would provide the consumer with essentially useless information. FSIS strongly encourages manufacturers who believe the consumer would benefit from "as consumed" nutrition values to voluntarily provide this information. Manufacturers of special case products who believe their products should be labeled on an "as consumed" basis and not "as packaged" should submit a labeling application to the Agency.

FSIS believes that the addition of another column to the Reference Amount table based on NFCS yields and USDA Handbook #8 will provide the additional information needed by manufacturers to determine Reference Amounts for their products. Also, FSIS believes that "as consumed" nutrient values must be accompanied by preparation and cooking instructions. To retain harmonization of labeling between the FSIS and FDA, FSIS will require "as packaged" nutrient values for products covered under the mandatory program. "As consumed" nutrient values may voluntarily be added, provided that preparation and cooking instructions are clearly stated. Products covered by the voluntary program may list nutrient values either on an "as packaged" or "as consumed" basis.

5. *Units of measure for declaring the serving size.* FSIS proposed to require the use of common household and metric measures to declare serving sizes. In addition, FSIS proposed that serving sizes may be declared in ounces and fluid ounces (U.S. measure), in parenthesis, following the metric measure where other common household measures are used as the primary unit for serving size (e.g., 1 cup (28 g) (1 oz)). FSIS also proposed rules

for expressing serving size in common household measures. These rules are intended to ensure as much uniformity as possible in label serving sizes within a Product Category. The rules are as follows:

a. Whenever possible, cups, tablespoons or teaspoons should be used. Cups should be expressed in ¼ cup increments; tablespoons in whole numbers for quantities less than ¼ cup but equal to or greater than 1 tablespoon; teaspoons in whole numbers for quantities less than 1 tablespoon but equal to or greater than 1 teaspoon; and in ¼ teaspoon increments for quantities less than 1 teaspoon.

b. If cups, tablespoons or teaspoons are not applicable, units such as piece, slice, tray, jar, and fraction of the whole piece or package should be used. These units are the common household measures that are most appropriate for food products not measurable by a cup, tablespoon, or teaspoon.

c. If neither of the above is applicable, ounces may be used. Ounce measurements should be expressed in 0.5 ounce increments most closely approximating the Reference Amount.

Several commenters stated that they believe that some foods would be more precisely measured in ⅓ cup increments and would like this option added to the final rule. FSIS believes this is an acceptable change. Parenthetical metric measure is required and has been standardized; therefore, uniformity in the common household measure is not as critical. In addition, allowing ⅓ cup increments is likely to reduce potential manipulation of the label serving size for measurements that fall between ¼ and ½ cup (e.g., ¼, ⅓, ½, ⅔, ¾, and 1).

Several commenters stated that when declaring serving size, the U.S. measure should be mandatory, in addition to, or instead of the metric measure. Other commenters objected to voluntary declaration of the U.S. measure in addition to the common household measure, arguing that it was unnecessary, would crowd the label, and would be confusing to consumers. Because the comments indicated such varied views on the listing of the U.S. measure, FSIS has decided to make the listing of the equivalent U.S. measure after the metric measure voluntary.

Several comments opposed requiring the rounding of the ounce unit of measure to the nearest 0.5 ounce. They expressed that the ounce measurement should be rounded to the nearest 0.1 ounce increment. Listing ounce measure in 0.5 ounce increment would result in a large discrepancy between metric measure. Since listing gram quantities will be mandatory, commenters believe that more exact declaration of ounce measures should be used.

FSIS will require 0.5 ounce increments to be used when the primary serving size (household measure) is expressed in ounces [e.g., beef fillet 3 oz. (85 g)], to be meaningful to consumers. This does not apply to the voluntary ounce serving size (U.S. measure) declarations [e.g., chicken wing, 2 wings (80 g) (about 2.8 ounces)]. The ounce measure in this case can be a decimal quantity rounded to 0.1 increments. FSIS believes that the more exact ounce measures are justified because they will reduce the error in gram-to-ounce conversions and reduce consumer confusion.

Commenters opposed the requirement that products whose common household measure is an ounce must also bear an appropriate visual representation of the serving size. They contended that the ounce is a unit of measure that is well understood by the public and that the visual representation requirement will only serve to confuse the consumer; therefore, no artificial comparisons need be made. FSIS believes that a visual representation requirement is unnecessary and may be confusing to consumers. Therefore, FSIS will no longer require a visual representation of serving size for products whose common household measurement is in ounces.

Commenters expressed concern that the use of several parentheses within the serving size statement (e.g., 2 slices (28 g) (1 oz)) would make the statement more difficult to understand. The commenters recommended that FSIS allow flexibility to use commas and slashes. FSIS believes that allowing such flexibility would result in non-uniformity in the declaration of label serving sizes. For example, the serving size for sliced luncheon meat could be expressed five different ways: 2 slices (28 g) (1 oz) by brand A; 2 slices (28 g, 1 oz) by brand B; 2 slices (28 g / 1 oz) by brand C; 2 slices, 28 g, 1 oz by brand D; and 2 slices 28 g / 1 oz by brand F. The use of various formats for this declaration would be confusing.

After examining all possible combinations of the formats for the declaration of label serving size, FSIS finds that the most desirable format is to require the presentation of all serving size information other than the mandatory common household measure, in one set of parenthesis with the different serving size statements separated by a slash (i.e., 2 slices (28 g / 1 oz)).

FSIS also proposed to allow an additional column of figures to be declared on the nutrition label based on 100 grams, 100 milliliters, or 1 ounce of the food as packaged or purchased. Commenters were opposed to limiting the optional second column to 100 grams or 100 milliliters. Manufacturers believe they should be able to determine the unit of measure used in the optional second column. They believe that they are in the best position to determine which unit will best serve their consumers.

The purpose of the optional second column is to provide consumers with another means of comparing products. The advantage would be lost if each manufacturer listed its own unit of measure on the label. Therefore, FSIS will limit the optional second column to 100 grams, 100 milliliters, or 1 ounce.

6. *Definition of serving size and single-serving container.* The FSIS proposed definition for a serving or serving size was "an amount of food customarily consumed per eating occasion by persons 4 years of age or older, which is expressed in a common household measure that is appropriate to the food." If the article were represented to be for infants or for toddlers, the proposed definition of a serving or serving size was "an amount of food customarily consumed per eating occasion by infants through 12 months of age or by children 1 through 3 years of age."

FSIS proposed to define a single-serving container as a container or package containing less than 200 percent of the Reference Amount. The nutrition profile on the single-serving container will be declared on the total content of the container. Some comments stated that the upper limit on single-serving containers should be rolled back to 150 percent of the RACC because the 200 percent cut off level is too high for some products (e.g., entrees, mixed dishes not measurable with a cup, salads, soups). Other comments suggested allowing the manufacturer to decide the single-serving status of a package that contains between 150 percent and 200 percent of the RACC.

FSIS has found that products whose Reference Amounts are 100 grams or larger are less likely to be consumed at a level twice that of the Reference Amount. Therefore, FSIS will allow manufacturers to determine whether there are 1 or 2 servings in packages that contain more than 150 percent, but less than 200 percent of the Reference Amount, if the food in the package has a Reference Amount of 100 grams (or milliliters) or larger, and if the entire content of the package can reasonably

be consumed at a single-eating occasion. The determination should be based on food consumption data under actual conditions of use. Manufacturers should be prepared to provide FSIS with the data that supports the single-serving claim upon request. The Agency is aware that this allowance has a potential for misuse and products that are obviously intended to be consumed in one serving must be labeled as such or they would be considered misleading. The Agency intends to consider regulatory action for misuse of this allowance on single-serving containers.

An industry comment stated that the parenthetical listing of the equivalent metric weight of the serving size is unnecessary on single-serving containers when the net quantity of contents includes the metric weight and is provided on the principal display panel.

FSIS agrees with this comment. However, for some products the metric quantity for serving size and the metric quantity for net weight may differ. For example, the serving size for products packed or canned in liquid that is customarily consumed (e.g., canned meat or poultry), where the serving size is expressed on the drained weight. Therefore, FSIS believes it is reasonable to exempt single-serving containers from the parenthetical metric measure requirement, if the metric quantity for net weight and serving size are the same.

7. *Declaration of number of servings her container.* FSIS proposed that the number of servings per package or container be declared to the nearest whole or approximate whole number. Several comments opposed requiring a whole number and requested that the number of servings per container be rounded to the nearest 0.5 servings.

Commenters stated that rounding to the nearest whole serving would significantly distort a container's contents, especially for packages containing between 1.5 and 4.5 servings. Industry commenters agree that many consumers do not like to see a fractional number of servings in the nutrition information. However, they believe, and the Agency agrees, that the basis for this dislike is from the use of decimal fractions (e.g., 2.7 servings) and a decimal fraction number of servings on containers that are obviously single-serving containers. Commenters believe that rounding to the nearest 0.5 servings will be understood by all consumers.

FSIS believes that this is an acceptable change. FSIS does not believe that a half serving is necessary or meaningful for large containers (e.g., 8.5 servings) or is desirable on small packages containing less than 200 percent of the Reference Amount. Therefore, manufacturers will be allowed to round to the nearest 0.5 serving for packages containing between 2 and 5 servings. Products containing less than 200 percent of the Reference Amount must follow the rules for single-serving containers. Products containing 5 servings or more per container will be rounded to the nearest whole serving.

Additionally, the proposed rule provided two options for declaring number of servings per container: (a) Declare serving size as the approximate whole household measure that results in a whole number of servings in the container (e.g., serving size: approximately ½ cup; number of servings per container: (10) or (b) declare serving size in exact household measure and approximate the number of servings per container (e.g., serving size: ½ cup; number of servings per container: approximately 10) (see 21 CFR 101.9(b) (8) (i) and (ii)).

Several comments opposed the two options in the proposal. They recommended that manufacturers list the exact serving size and approximate number of servings per container. They believe it is more important for the consumer to know the exact serving size, which is the basis for the nutrition information.

FSIS recognizes that allowing the two options as proposed would result in nonuniformity, and would make nutrition comparisons of different brands of the same food difficult. Therefore, FSIS will require the exact serving size and the approximate number of servings.

The proposed rule made an exception for random weight products from the requirement for number of servings per container. For random weight products such as kielbasa, manufacturers would have problems in declaring the number of servings per package. FSIS proposed to accommodate random weight packages by allowing manufacturers to declare the number of servings per container as "varied", provided the nutrition information was based on the Reference Amount expressed in ounces.

The comments supported the option of listing the servings per container of random weight packages as "varied," but also suggested allowing an optional statement describing the typical number of servings per base weight unit when "varied" is used to declare the number of servings per container (e.g., varied (approximately 8 servings per pound)). FSIS believes this is a reasonable option that will provide further clarification for consumers.

VII. Nutrient Content Claims

To alleviate widespread public confusion associated with descriptors, the NLEA contains requirements regarding nutrient content claims. It precludes, except for specified limited exceptions, the use of any nutrient content term that characterizes the level of any nutrient that has not been defined by FDA by regulation, and requires FDA to define "free," "low," "light" or "lite," "reduced," "less," and "high." The NLEA places limitations on cholesterol, saturated fat, and dietary fiber claims for a food by requiring these claims to be accompanied by prominent disclosure of the food's level of fat or saturated fat, cholesterol, and total fat, respectively, on the label. The NLEA does not address the use of cholesterol claims based on threshold criteria for fat or saturated fat content.

The Food Labeling Division of FSIS has issued several policy memoranda in connection with its label approval system, outlining quantitative criteria for permitting the use of selected descriptors such as "low calorie," "low sodium," "low fat," and "lean." (Copies of these policy memoranda are available for public review in the FSIS Hearing Clerk's office.) For many years, the Agency's definition for "lean", except as applied to ground beef, hamburger, and products containing added substances, such as water or extenders, has been no more than 10 percent fat content. The memoranda currently require at least a 25 percent reduction from specific reference points for comparative expressions such as "lower." FSIS also uses informal working policies for nutrient content claims for some food constituents, such as cholesterol in meals and fiber. FSIS has no current regulatory definitions for any nutrient content claims.

FSIS proposed the adoption of most of FDA's proposals, published in the Federal Register simultaneously with FSIS's proposed rule, for 21 CFR 101.13, Nutrient Content Claims—General Principles; 21 CFR 101.54, Nutrient Content Claims for "Source" and "High"; 21 CFR 101.56, Nutrient Content Claims for "Light" or "Lite"; 21 CFR 101.60, Nutrient Content Claims for the Calorie Content; 21 CFR 101.62, Nutrient Content Claims for the Fat, Fatty Acids, and Cholesterol Content of Foods; and 21 CFR 101.69, Petitions for Nutrient Content Claims. In addition, FSIS proposed definitions for the terms "lean" and "extra lean" as unique descriptors for meat and poultry products. In the above documents, FDA

set forth proposals required by the NLEA. The FSIS proposals were an effort to harmonize food labeling regulations with FDA's and were in response to the comments received from FSIS's ANPR on nutrition labeling.

FSIS's proposal specifically included a discussion on the use of descriptive terms in brand names, since many products regulated by FSIS contain descriptive terms in the brand name ("brand name" is a generic term used to define a fanciful name, trademark, etc.). The proposal provided for the use of a descriptive term in a brand name, provided the product met the prescribed definition for the term. The proposal stated that nutrient content claims not defined by regulation that appeared as part of a brand name, could be used if they were not false or misleading, and only if the brand name was in use prior to November 27, 1991, the date of the proposal. A list of brand names that included descriptive terms was compiled from labels on file with the Food Labeling Division, and included to provide specific examples of some of the products that may be affected by the proposals.

FSIS proposed definitions for "lean" and "extra lean" based on fat, saturated fatty acids, and cholesterol thresholds suggested by the American Heart Association (AHA) in response to the ANPR. FSIS found merit in AHA's suggested values, and proposed the quantitative values per 100 grams of product by extrapolating the 1 ounce values AHA suggested, yielding the following values:

TABLE 4

	Fat	Saturated fatty acids	Cholesterol
Lean	<10.5 g	<3.5 g	<94.5 mg
Extra Lean	<4.9 g	<1.8 g	<94.5 mg

These values for the fat content of 10.5 and 4.9 grams approximated the Agency's current definitions for the terms "lean" and "extra lean."

FSIS proposed the values for "lean" and "extra lean" as descriptors for use in all meat and poultry products. Accordingly, the terms could be used on multi-ingredient, meal-type products as well as muscle cuts of meat, ground beef, and hamburger. Currently, FSIS extends special exception to ground beef and hamburger for the purposes of "lean" and "extra lean" labeling. "Lean" and "extra lean" ground beef and hamburger can contain up to 22.5 percent fat, a 25 percent reduction from the regulatory standard of 30 percent fat for these products.

Specifically mentioned in the proposal were the "_____ percent fat free" claims. FDA proposed to prohibit the claim in those circumstances in which it would be misleading. The FDA criteria was for the product to meet the definition for "low fat" and for the label or labeling to disclose the amount of total fat per serving of the product. The Agency reviewed FDA's proposal on this issue and fully agreed with FDA, and therefore proposed the same criteria for meat and poultry products.

There was overwhelming support in response to the proposal for FSIS to proceed with the adoption of FDA defined nutrient content claims (the term "nutrient content claim" is replacing "descriptor" for consistency with FDA). The majority of parties commenting on the FSIS proposal have primary interest in the products regulated by the Agency. Therefore, the majority of comments relating to nutrient content claims focused directly on the areas of the proposal that were unique to FSIS, namely the terms "lean" and "extra lean."

Trade associations, industry, and consumer groups supported the Agency's proposal to provide the unique descriptors "lean" and "extra lean." Several trade associations and manufacturers disputed the total fat and saturated fatty acids numbers as extrapolated to 100 grams, arguing that inherent to ruminant muscle, the saturated fatty acids to fat ratio is 40 percent.

Trade associations and manufacturers believe that the AHA values presented per 3 ounces cooked represented attainable values for meat. Many commenters suggested that including a saturated fatty acid criterion in the definition of "lean" and "extra lean" was too restrictive.

Trade associations believe that AHA, in its original presentation of "lean" and "extra lean" to the industries it represents, did not intend to discriminate against the inherent saturated fatty acid content of ruminant muscle.

TABLE 5 is a review of AHA's quantitative values, showing the saturated fatty acids to fat ratio:

TABLE 5

	Fat	Saturated fatty acids	Ratio (%)
Lean:			
1 oz. cooked.	<3 g	<1 g	33.3
3 oz. cooked.	<8 g	<3 g	37.5
Extra Lean:			
1 oz. cooked.	<1.4 g	<0.5 g	35.7
3 oz. cooked.	<4.3 g	<1.4 g	32.5

In response to the ANPR, AHA provided tables of meat and poultry that would be included in its proposed definitions of "lean" and "extra lean." As a parameter for determining the meat and poultry products that would meet the definitions, AHA factored a rounding margin of 0.4 grams for the 3 ounce cooked values (i.e., 8.4 could be rounded to 8.0 grams). Table 6 represents the ratios of the saturated fatty acids to fat for the 3 ounce values factoring in the rounding margins used by AHA:

TABLE 6

	Fat	Saturated fatty acids	Ratio (%)
Lean:			
3 oz. cooked.	<8.4 g	<3.4 g	40.5
Extra Lean:			
3 oz. cooked.	<4.4 g	<1.4 g	31.8

Many trade associations and industry comments suggested that the 3 ounce cooked numbers, when rounded to the according values in TABLE 5, would further provide an appropriate ratio of saturated fatty acids to total fat that meat could achieve. FSIS's proposal did not specify the rounding for the fat, saturated fat, and cholesterol values. Numerous commenters requested that FSIS clarify the rounding that would apply to the proposed values, and asked that the values be rounded to the whole gram.

The Agency's intention was to provide the unique nutrient content claims "lean" and "extra lean" specifically for use on meat and poultry products. As a result of the Agency's use of the 1 ounce cooked numbers to extrapolate to 100 grams, the "lean" and "extra lean" definition contained a saturated fatty acids to total fat ratio of 33.3 percent and 36.7 percent, respectively. As discussed earlier, some meat and poultry products will not utilize many of the descriptive terms included in FDA's nutrient content claims regulations. The Agency's resolve is to furnish meat and poultry products with equitable descriptive terms through the use of the terms "lean" and "extra lean." In light of the overwhelming comments indicating that adherence to the saturated fat to total fat

ratios are impossible for meat, FSIS is withdrawing the qualitative values proposed.

FSIS believes, and is supported by commenters, that the AHA 3 ounce cooked values have merit. The Agency also believes that "lean" and "extra lean" definitions that recognize and allow for the inherent saturated fatty acid content of meat can easily include a saturated fatty acid criterion in the definition.

The Agency further believes that defining the terms "lean" and "extra lean" with fat, saturated fatty acids, and cholesterol values per 3 ounces is difficult to apply to any definition. FSIS proposed the "lean" and "extra lean" values solely per 100 grams. It was the Agency's intent to propose a dual criteria, per 100 grams and per labeled serving.

To maintain as much consistency with the criteria for nutrient content claims as possible, the Agency is modifying in the definitions of "lean" and "extra lean," the dual criteria of per RACC and 100 grams for individual foods and per 100 grams and per labeled serving size for meal-type products. The Agency is retaining the 100 gram requirement for individual foods because the RACC for the same food may vary depending on the use of the food (e.g., ham used as a luncheon meat RACC is 55 grams, ham used as an entree RACC is 85 grams).

The effect this would have on nutrient content claims is the luncheon meat could have approximately ⅓ more of a nutrient (such as fat, saturated fatty acids, cholesterol, or sodium) to qualify for a claim such as "low". The Agency believes this would be false and misleading for consumers.

To facilitate the use of the 3 ounce values for the terms "lean" and "extra lean", the values were converted to a percentage (100 gram) basis. The following values are a result of extrapolating AHA's proposed 3 ounce cooked values to 100 grams (conversion factor 1 ounce=28 grams):

	Fat	Saturated fatty acids	Cholesterol
Lean	9.5 g	3.6 g	95.2 mg
Extra Lean	5.1 g	1.6 g	95.2 mg

The Agency took these numbers and rounded them to the nearest whole number:

	Fat	Saturated fatty acids	Cholesterol
Lean	10 g	4 g	95 mg
Extra Lean	5 g	2 g	95 mg

The ratio of saturated fatty acids to fat is 40 percent for both "lean" and "extra lean". The numerical rounding for these numbers will be the rounding proposed for the fat, saturated fatty acids, and cholesterol on the nutrition label after compliance considerations are taken into account. Fat and saturated fat will be rounded to the nearest 0.5 gram (i.e., 10.24 grams is rounded to 10 grams) and cholesterol to the nearest 5 milligrams.

The Agency's proposal to apply the "lean" and "extra lean" definitions to all meat and poultry products, including ground beef and hamburger, received divided comments. Many commenters supported the use of the terms to describe processed meat and poultry products while some commenters did not. Many ground beef and hamburger manufacturers urged the Agency to reconsider the exemption for ground beef and hamburger.

The criterion for some of the nutrient content claims defined by FDA will not allow many meat and poultry products to qualify for their use. The Agency is offering "lean" and "extra lean" as alternatives for meat and poultry products, including meal-type products, injected products, pumped products, and breaded and battered products. Offering these terms to muscle products exclusively would bring disparity to meat and poultry products. FSIS believes that a meat and poultry product meeting the definition for "lean" or "extra lean" should be permitted to label that product as such, regardless of whether the product has added ingredients or is a muscle meat. Carrying that belief further, the Agency believes that applying these definitions across all product categories would best benefit the consumer and aid in nutrition education. By granting ground beef and hamburger an exemption, there would be a dual criteria pertaining to these definitions. The Agency believes it cannot permit this confusion in the marketplace nor in the education of consumers. Therefore, the definitions of "lean" and "extra lean" will be applied categorically across all meat and poultry products.

Commenters also recommended the term "_____ percent lean" to be allowed on the labeling of muscle meats which contain 20 percent or less fat, especially as an alternative for ground beef and hamburger. The agency has given this recommendation careful consideration and believes that, in light of the "_____ percent fat free" regulation discussed below, "_____ percent lean" would be a viable alternative for meat and poultry. The Agency received comments in support of unified nutrient content claims, and, therefore, will adopt the definition for "_____ percent fat free" claims. The "_____ percent fat free" and "_____ percent lean" claims must meet the definition for "low fat."

Inadvertently omitted in the proposed codified language for "lean" and "extra lean" were the general requirements that accompany all the nutrient content claims. The general requirements provide that the product be labeled in compliance with § 317.309 or § 381.409, and the nutrient content claims comply with the requirement of § 317.313 or § 381.413. The Agency has corrected that oversight in this final rule.

The comments received by FDA, in response to its nutrient content claims proposals, specifically addresses the definitions of terms. Responses to the FSIS proposals that commented on nutrient content claims would, in some instances, include responses written to FDA, along with a brief comment expressing support for harmonization between FSIS and FDA.

In response to the comments it received, FDA has made modifications to its proposals. Since FSIS is adopting most of the FDA nutrient content claims proposals, the two Agencies have been working closely on the resolution of key issues raised by comments, and the modifications to the proposals. A brief discussion of six key issues related to nutrient content claims follows:

1. *Nutrient density.* FDA proposed for nutrient content claims the criteria of per RACC, per labeled serving size, and per 100 grams of food for individual foods. Commenters expressed concerns that the 100 gram criterion would inappropriately prohibit "low" claims on many foods, and that the 100 gram criterion, in addition with the RACC criterion, was excessive.

Weight based criterion was proposed to prevent "low" claims on certain foods that are dense in a nutrient on a weight basis yet still qualify for a low claim because of their small serving size.

This final regulation will be modified by applying a weight-based criterion for "low" claims and "very low sodium" claims only to foods with small serving sizes (i.e., 30 grams or less or 2 tablespoons or less). These foods will be evaluated on a per RACC and 50 gram requirement. All other individual foods will be evaluated on a per RACC basis only.

2. *Comparative claims.* Comments received in response to FDA's proposals suggest that consumers do not differentiate between the terms "less" ("fewer") and "reduced," and, therefore, the terms should be considered synonymous. Commenters also opposed

the minimum (quantitative) reduction requirement, stating that this criterion is overly restrictive, would prevent claims on small serving sizes, and would penalize foods that have already been nutritionally improved.

This final rule has been modified to permit the use of "reduced" and "less" ("fewer") as synonymous terms referring to a reduction of at least 25 percent in a nutrient. In order that reductions not be trivial, claims will be prohibited if the reference food already meets the criteria for "low." Disclosure of the percent reduction and the reference food will be required with a claim.

3. *"Light" or "lite".* Many comments to FDA's proposals contended that certain products would not be able to make a "light" claim under the proposed definition. Comments questioned the feasibility of creating an acceptable product reduced both in calories and fat (fat substitutes often contain a significant number of calories) or, in the case of products with small serving sizes, unable to make sufficient reductions due to the small amount of nutrients in the regular product. The proposed definition was based on the belief that consumers equated the use of the term "light" with calories. To support this belief, FDA cited data contained in (1) FDA's 1982 Health and Diet Survey and (2) Calorie Control Council's January 9, 1990, New Release, "Americans Finding 'light' to Their Liking." The Calorie Council's survey showed that consumers associate the term "light" with calories, as well as with fat. A National Consumers Survey by the Gallop Organization showed that 8 out of 10 consumers of "light" products use these products to reduce fat. Therefore, the "light" definition has been modified to include a fat and calorie reduction requirement. To satisfy the "light" definition, foods with greater than 50 percent calories from fat must reduce fat by 50 percent. Foods with less than 50 percent calories from fat must reduce the fat by 50 percent and the calories by one-third. FSIS and FDA believe that "light" for sodium can be nutrient specific, and has modified this final rule to provide for the use of the term "light in sodium." "Light in sodium" will mean 50 percent reduction in sodium.

4. *Implied claims.* FDA proposed that an "implied" claim was a statement that would lead a consumer to assume: (a) That a nutrient is absent or present in a certain amount, and (b) that a food, because of its nutrient content, is useful in achieving a total daily diet conforming to dietary guidelines (e. g., "healthy"). Healthy was not defined. Therefore, under the proposal, healthy could not be used, except in "grandfathered" brand names.

Health professionals, consumer organizations, States, and a segment of industry suggested that such claims should either be prohibited entirely or be defined. Many industry comments stated that terms such as "healthy," "nutritious," and "wholesome" are not implied claims under the NLEA.

Many comments proposed definitions for the term "healthy", ranging from "low in fat, saturated fat, cholesterol and sodium plus high in at least two key micronutrients," to "not exceeding the levels of fat, saturated fat, cholesterol and sodium that would be inconsistent with dietary guidelines"; e.g., the disclosure/disqualifier levels.

Before the term "healthy" can be defined, FSIS will seek public comment on this issue by publishing a proposed rule with request for comments.

5. *Meal-type products.* FDA's proposal included the definition of meal-type product as a food that: (a) Makes a significant contribution to the diet either by providing at least 200 calories per serving or by weighing at least 6 ounces per serving; (b) contains ingredients from two or more of the four food groups; and (c) is represented as a meal, main dish, entree or pizza. Claims for these meal-type products generally would be based on nutrient levels per 100 grams.

Industry comments generally supported the proposed definition of meal-type products whereas health professional and consumer advocacy groups found it too broad, and the 200 calorie requirement much too low. Some of these groups also found the requirement for a minimum of two ingredients (as opposed to two servings) too liberal, and would not meaningfully distinguish meal-type products from individual foods.

The responses FSIS received to the definition of meal-type products overwhelmingly supported, rather than opposed, the Agency's proposed definition. FSIS believes the majority of meal-type products fall under the Agency's purview, and does not believe the comments received warrant major changes in the definition proposed. Comments received suggest that a 200 calorie level is an insufficient amount of food for a meal-type product, even for those on a reducing diet and that a number of individual foods would meet this minimum caloric level. Increasing the caloric level substantially might exclude a number of meal products appropriate for weight maintenance or weight reduction.

Comments support the weight requirement of 6 ounces. Nielson Scantrack 1990 through 1991 Data, provided to the Agency, show that 78.7 percent of the frozen dinners (6.0 ounces—24.0 ounces) surveyed fall between 6 ounces and 12 ounces.

The Agency is convinced by comments that the 200 calorie requirement is insufficient. The Agency believes a weight requirement is necessary to ensure that products represented as meals contain adequate amounts because of their contribution to the overall diet. Therefore, the Agency is modifying the meals definition to exclude a minimum calorie requirement, but include a minimum and maximum weight requirement of 6 ounces and 12 ounces respectively.

The definition proposed will remain, with criterion (a) modified to: "Makes a significant contribution to the diet by weighing at least 6 ounces, but not more than 12 ounces." Meal-type products weighing more than 12 ounces will be evaluated on a case-by-case basis.

The term "source" for meal-type products was proposed to be used when a product contained 10–19 percent of the RDI or DRV for the nutrient per 100 grams of product. The term "high" was proposed for use on meal-type products that contained equal to or greater than 20 percent of a nutrient per 100 grams. Comments stated that the per 100 gram basis would result in inappropriately high nutrient levels to make products eligible for "high" or "good source" claims. For example, to make a "high in Vitamin C" claim, a 10-ounce dinner would be required to contain over one half of the DRV. Comments also stated that products that contain a smaller percent of the DRV still may be considered excellent nutrient sources. Therefore, the final regulation has been modified to provide for the use of the terms "source" and "high" on meal-type products that contain an individual food that meets the definitions of "source" and "high." For example, the label or labeling claim for a meal-type that contained carrots could state "Carrots are a source of Vitamin A."

6. *Brand to brand comparisons.* As a basis for comparative terms, the FSIS proposal provided as reference foods:

(1) An industrywide norm, i.e., a composite value weighted according to a national market share on a unit or tonnage basis for all the foods of the same type as the food for which the claim is made;

(2) A manufacturer's regular product that has been offered for sale to the public on a regular basis for a substantial period of time in the same geographic area by the same business

entity or by one entitled to use its trade name; or

(3) A food or class of food whose composition is reported in a current valid data base.

Many industry comments objected to only a manufacturer's own brand for use as a reference food. The Agency believes that use of a competitor's products has the potential for unwarranted inferences. Therefore, this final rule does not permit competitors' products as reference foods.

For easy reference, the following two tables contain the nutrient content claims definitions which have been modified from the proposed definitions.

TABLE 7.—NUTRIENT CONTENT CLAIMS FOR FOODS

Nutrient	Free	Low	Reduced/less/fewer	Other
	Synonyms for "Free": "Free of", "No", "Zero", "Without", "Trivial source of", "Negligible source of", "Dietarily insignificant source of".	Synonyms for "Low": "Contains a small amount of", "Low source of", "Low in".	Synonyms for "Reduced/Less/Fewer": "Reduced in", "Lower", "Lower in".	
	Exception: "Sugarless", "Nonfat" .	Exception: "Little sodium", "Few" for calories, "Little fat", "A little saturated fat", "Little cholesterol".	.....	
Calories	<5/RACC	Reference Amount: >30g or >2T: <=40 cal/RACC.	>=25% fewer	
		Reference Amount: <=30g or <=2T: <=40 cal/RACC & /50 grams.	.....	
Sodium	<5mg/RACC	Reference Amount: >30g or >2T: <=140 mg/RACC.	>=25% fewer	"Very Low Sodium", "Very Low In Sodium".
	"Salt Free" may be used if food is "Sodium Free".	Reference Amount: <=30g or <=2T: <=140 mg/RACC & 50 g.	.....	Reference Amount >30g or >2T: <=35 mg/RACC, <=30 g or <=2T: <=35 mg/RACC & 50 g.
Total Fat	<0.5g/RACC	Reference Amount: >30g or >2T: <=3 g/RACC <=30% calories from fat.	>=25% fewer	"____% Fat Free" must meet "low fat" criteria.
				"____% Lean" must meet "low fat" criteria.
Saturated Fat	<0.5 g/RACC & Level of trans fatty acids.	Reference Amount: >30g or >2T: <=1 g/RACC <=15% calories SFA.	>=25% fewer	
	<1% of total fat	Reference Amount: <=30g or <=2T: <=1 g/RACC & /50 g <=15% calories SFA.	.....	
Cholesterol	<2mg/RACC <=2 g SFA/RACC	Reference Amount: >30g or >2T: <= 20 mg/RACC <= 2 g SFA/RACC.	>=25% fewer and <=2 g SFA/RACC.	
		Reference Amount: <=30g or <=2T: <=20 mg/RACC & 50 g <=2 g SFA/RACC.	.....	
Sugar	<0.5 g sugar/RACC	.....	>=25% fewer/RACC	"No added sugar", "Without added sugar", "No sugar added" if no amount of sugar, or ingredient that functionally substitutes for added sugars is added, the product does not contain ingredients containing added sugars, and the food declares (unless it meets definition that) it is not "low calorie" or "reduced calorie"

*RACC=Reference Amount Customarily Consumed.

TABLE 8—NUTRIENT CLAIMS FOR MEALS

Nutrient	Free	Low	Reduced/less/fewer	Other
	Synonyms for "Free": "Free of", "No", "Zero", "Without", "Trivial source of", "Negligible source of", "Dietarily insignificant source of".	Synonyms for "Low": "Contains a small amount of", "Low source of", "Low in".	Synonyms for "Reduced/Less/Fewer":.	
	Exception: "Sugarless", "Nonfat" .	Exception: "Little sodium", "Few" for calories, "Little fat", "A little saturated fat", "Little cholesterol".		
Calories	Not defined	<=120/100g	>=25% fewer/100 grams.	
Sodium	<5mg/Labeled Serving	<=140mg/100g	>=25% fewer/100 grams	"Very Low Sodium" "Very Low in Sodium"
	"Salt Free" may be used if food is "Sodium Free".	.....	.....	<=35 mg/100 gram
Total Fat	<0.5g/Labeled Serving	<=3 g/100g and <30% cal from fat	>=25% fewer/100 grams	"____% Fat free" must meet "low fat" criteria.

TABLE 8—NUTRIENT CLAIMS FOR MEALS—Continued

Nutrient	Free	Low	Reduced/less/fewer	Other
Saturated Fat	<0.5g/Labeled Serving and Level of trans fatty acids.	<=1 g/100g <10% calories SFA	>=25% fewer/100 grams.	"____ % Lean" must meet "low fat" criteria.
	<1% Total Fat			
Cholesterol	<2 mg/Labeled Serving	<20 mg/100 grams	>=25% fewer	
	<=2g SFA/Labeled Serving	<=2 g SFA/100g	<=2 g SFA/100g.	
Sugar	<0.5g/Labeled Serving	.....	>=25% fewer/100 grams	"No added sugar", "Without added sugar", "No sugar added" if no amount of sugar, or ingredient that functionally substitutes for added sugars is added, the product does not contain ingredients containing added sugars, and the food declares (unless it meets definition that) it is not "low calorie" or "reduced".

7. *Petitions.* FSIS proposed to provide a petition process, consistent with FDA, to permit the use of nutrient content claims not included in the proposal, synonymous terms that are consistent with a regulatory term, and implied claims made as part of the brand name. The proposed rule would have required the petitions to be supported by detailed information, including:

(1) A description of the term and the nutrient that the term is intended to characterize;

(2) A detailed explanation of why use of the food component characterized by the claim is important to human nutrition;

(3) Analytical data that demonstrate the amount of the nutrient that is the subject of the claim; and

(4) A detailed analysis of the potential effect of the use of the proposed claim on food consumption.

The proposed rule would have required petitions for new nutrient content claims to be processed through rulemaking proceedings. Upon receipt and review of such petitions, FSIS would notify the applicant, in writing, that the petition was either being considered for further review or that the petition had been denied by the Administrator. If the Administrator denied the petition, he or she would notify the applicant, in writing, as to the reason(s) for the denial. If the claim were approved by the Administrator, the Agency would notify the applicant by letter and would also publish in the **Federal Register** a proposed rule to amend the regulations to authorize the use of the claim in the labeling of meat and poultry products.

FSIS also proposed petition processes for synonymous terms and implied claims that would not require processing through rulemaking proceedings. The petition process proposed for synonymous terms generally followed the same process as the process for new nutrient content claims, except, instead of publishing a proposed rule and seeking comment, the Agency would publish a notice in the **Federal Register** informing the public of the Administrator's decision to grant the approval of the synonymous term.

The petition process proposed for implied claims would have required FSIS, upon receipt and review of such petition, to notify the applicant, in writing, that the petition was either being considered for further review or that the petition had been denied. The Administrator would publish in the **Federal Register** a notice of the petition, announcing its availability to the public and seeking comment on the petition. If the Administrator denied the petition, he or she would notify the applicant, in writing, as to the reason(s) for the denial. If the claim were approved by the Administrator, the Agency would notify the applicant by letter and would also publish a notice in the **Federal Register** informing the public of such fact.

As discussed in FSIS's proposed rule on nutrition labeling, many comments responding to the ANPR on nutrition labeling recommended that FSIS not approve the use of claims on a case-by-case basis under the prior label approval process. Such commenters suggested that such uses be permitted through a petition and rulemaking process that would provide full opportunity for public comment. In response to those comments, FSIS proposed to establish such a petition process.

FSIS received a comment urging FSIS to simplify its request for information in the petitioning process. The commenter contended that such elaborate information would be unduly burdensome to industry and would serve as a disincentive for the development of healthful products.

In reevaluating this proposed process, FSIS determined that a process for approving new claims would best be conducted under the prior label approval system. The requesting establishment will be required to submit only one request to FSIS for approval on the use of a new claim. Rather than petitioning for the use of a certain claim and, after FSIS approval, submitting a labeling application for the use of that same claim, the requesting establishment would be, in effect, "petitioning" the Agency for use of a certain claim through its submittal of a labeling application. Thereafter, other manufacturers desiring to use such claims would simply submit their standard labeling applications to FSIS for approval. Under such a process, label approval for the use of such claims will be provided in a more timely fashion, and preparation and submittal of certain duplicative information would be eliminated. FSIS's petition process is still consistent with FDA's except for the mechanism used by manufacturers to request use of a new claim. FDA requires a "petition" whereas FSIS requires a "labeling application." All other aspects of the process are generally the same. The opportunity for public comment will still be available through the publication in the **Federal Register** of proposed rules or notices on the proposed claims, except synonymous claims, which will satisfy concerns discussed above regarding the need for public participation in the approval of new claims. (Labeling applications for the use of synonymous claims will not be issued for public comment prior to the Administrator's final determination, which is consistent with FDA).

In responding to the commenter of the proposed rule that the proposed information supporting a claim would be burdensome and discouraging to the industry, FSIS believes that determinations on the use of new nutrient content claims, synonymous claims, or implied claims must be validated by sound, reliable data. To assure the validity of any such claims, they must be supported by sound evidence on the potential effect of the proposed claim on food consumption and any corresponding changes in nutrient intake. The use of any such claims must also be proven to provide nutritional benefits to the public that are not already available through use of existing terms. Even more importantly, it must be demonstrated why the use of the proposed term would not be false or misleading.

FSIS maintains that responsibility for validating the use of a new claim rests with the manufacturer who desires to use the claim. Therefore, this final rule requires a manufacturer to request the use of a new claim by submitting a labeling application and the detailed proposed information which supports such use. Through review of the complete supporting information, FSIS can effectively determine the validity of such a proposed claim and, in the case of new nutrient claims and implied claims, provide the public with sufficient information upon which to base meaningful comment.

VIII. Compliance and Analytical Methods

As part of its prior label approval process, FSIS requires manufacturers to submit analytical data to support nutrient values and content claims on food labels. The Agency processed approximately 180,000 requests for label approvals in 1990, of which many contained nutrition information. FSIS conducts a nutrition labeling verification program to ensure the continued accuracy of label information after initial approval. Under the program, manufacturers periodically submit analytical data on their products for Agency review. FSIS nutrition labeling guidelines for meat and poultry products, which address requirements for initial label approval and continuing accuracy of labels, are contained in Policy Memoranda 85B and 86.

In the preamble to the proposed rule published in November 1991, FSIS maintained that each manufacturer is responsible for insuring the validity of nutrient declarations contained on product labels, and concluded that requirements for submission of laboratory data with requests for initial label approvals and nutrition labeling verification procedures are unnecessary. FSIS would require plant management to maintain records that support nutritional values and establish a partial quality control (PQC) program for nutrients that are subject of nutrient content claims. The Agency proposed to allow the most current representative data base values contained in USDA's National Nutrient Data Bank (NNDB) or its published form, the Agriculture Handbook No. 8 (AH–8) series, to be used for voluntary nutrition labeling of single-ingredient, raw meat and poultry products, without subjecting such labels or labeling to compliance review unless a nutrition claim was made.

On March 25, 1992, FSIS published a supplemental proposed rule in the **Federal Register** (57 FR 10298) to, in part, permit companies to base nutrient information on processed meat and poultry product labels on data bases, and on recipe analysis using data bases, as well as on laboratory analyses. The Agency proposed to adopt 80/120 tolerance levels in determining nutrition labeling compliance for naturally occurring nutrients and use samples consisting of a minimum of six units selected from within or across lots.

Commenters sought clarification about certain aspects of the compliance and analytical methods issues and suggested modification and revision of various provisions. A summary of these comments and the Agency's responses follow.

1. *Label approval and nutrition labeling verification.* All commenters addressing the current label approval requirements supported the termination of requirements relating to the submission of analytical data with initial requests for label approval, submission of periodic data to support the continuing accuracy of the label, and maintenance of FSIS-approved nutrition labeling verification procedures. Major reasons cited were associated burden, cost, and time consumption. Commenters supported Agency testing as the primary enforcement vehicle for the regulations. Trade associations and companies requested that current requirements be eliminated as soon as possible. Questions were raised as to whether a food may be labeled in compliance with the new nutrition labeling regulations, rather than existing policy memoranda, pending the implementation date of the nutrition labeling regulations.

FSIS believes that, in the best public interest, transition to nutrition labeling under the new regulations should begin immediately and that current testing requirements, as described in policy memoranda 85B and 86, be terminated upon publication of this final rule. This approach affords industry time to develop reliable data to meet the new labeling requirements and opportunity to develop or reformulate products to meet newly-defined nutrient content claims. During the 18-month interim period prior to implementation of these regulations, new labels bearing nutrition information that are not yet in compliance with these regulations will be accepted for initial prior label approval without previously required supporting laboratory data. Nutrition label panels will be validated as to conformance either with existing policy or the new regulations during initial approvals.

A number of commenters stated that firms with limited experience in nutrition and health-related labeling might need assistance in preparation and review of labels submitted for initial approval under the new regulations to ensure compliance and that manufacturers should be allowed to request such service. The Agency will provide such guidance in the form of instruction sheets for preparation of the nutrition panel and an FSIS manual on use of data bases. Copies of these materials may be obtained, without charge, from the Product Assessment Division, Regulatory Programs, Food Safety and Inspection Service, U.S. Department of Agriculture, Washington, DC 20250. Copies are also available for public review in the FSIS Hearing Clerk's office.

Many industry groups, including large trade associations and small packers, requested FSIS to develop the nutrient data for food products via Agency analysis and to format the nutrition panel at no charge, and/or to pay for the compliance samples taken from within the establishment to alleviate financial impacts on small businesses.

FSIS recognizes the potential economic impact of the regulations on small businesses and industry at large. Accordingly, this final rule provides a small business exemption and permits the use of data bases and recipe analysis using data bases to alleviate costs. In its proposal, the Agency stated it would monitor a minimum of six units for compliance and, in most cases, the number of samples taken would be 12 whenever feasible and not too costly. It further stated that for various products, such as large samples of ham, a composite of six units will be taken for cost and logistical efficiency. FSIS concludes that these multiple cost-saving measures negate commenters' concerns.

Numerous commenters requested clarification as to the content of records supporting the validity of label declarations. FSIS believes that adequate records may consist of results of direct product analyses, data base values and/or recipe calculations, or a combination of direct analyses, data base values, and recipe calculations.

Regarding direct analyses, the Agency will not dictate the number of tests to be performed because the frequency needed for accuracy of label values will vary according to the nature of the product, the nutrient, the sample size, and a host of other product-specific variables. Many different sampling plans can produce equal assurance that label declarations reflect nutrient content. FSIS believes the manufacturer is in the best position to determine the most appropriate plan for its own products. FDA has prepared a comprehensive guide for developing data bases based on direct analyses for food labeling purposes. The guide covers sampling objectives, the target population, and the sampling frame. While a person may follow the manual or choose to use alternate procedures, FSIS believes the manual will be useful to manufacturers in developing nutrition labeling. Copies of the manual entitled "FDA Nutrition Labeling Manual: A Guide for Developing and Using Data Bases," 1992 edition, may be obtained from the Division of Nutrition, Office of Nutrition and Food Sciences, Center for Food Safety and Applied Nutrition, Food and Drug Administration, Washington, DC 20240. Use of data base values and/or recipe calculations to satisfy recordkeeping requirements is discussed under part 2b of this section.

Commenters asked if the Agency planned to require companies to use FSIS-accredited laboratories to generate their nutrient data, which might preclude use of company-generated data. Historically, the Agency has conducted accreditation of laboratories for its own use, as opposed to use by companies. FSIS does not plan to accredit laboratories or conduct an accredited laboratory program for nutrient analysis for food labeling. Companies may use any laboratory of their choice and are responsible for the accuracy of the analytical information.

Trade associations and large companies requested that the regulations make clear that supporting records for multi-plant firms can be maintained at corporate headquarters or a central location, as opposed to individual manufacturing establishments, because manufacturers with multiple production facilities typically generate all labels at a central location. The provisions of 9 CFR 320.2 and 381.176 indicate that, if a person conducts business at multiple locations, records may be maintained at the headquarters' office.

Almost without exception, commenters voiced strong opposition to the requirement that establishments must, as a prerequisite to the use of labels or labeling containing nutrient content claims, seek FSIS approval of a PQC program. While not objecting to the concept or value of such programs to assure product quality, industry representatives argued that PQC requirements: (a) Are redundant under these regulations because FSIS monitoring would be the primary compliance and enforcement vehicle, (b) are unnecessary since well-defined compliance criteria are contained in the rules, (c) imply the Agency places lower enforcement priority on other mandated information, (d) would delay the introduction of new and reformulated products, and (e) might undo the economic benefits gained by eliminating the current nutrition labeling verification procedures. Some suggested that PQC requirements not be mandated for claims but, instead, PQC programs be allowed on a voluntary basis for all nutrition label compliance measures on the condition that Agency compliance monitoring results not be given enforcement precedence over PQC records.

The Agency has carefully considered these comments and concludes that the PQC requirements are contradictory to its regulatory objectives to place responsibility for label accuracy on manufacturers and implement nutrition labeling in the most cost-effective manner possible. FSIS encourages the timely marketing of new and reformulated products of benefit to public health and use of nutrient content claims that will help consumers to select among foods to achieve a healthy diet The Agency is convinced that the compliance criteria contained in the rules, coupled with its approach to inspection, including the presence of inspectors to oversee processing controls and ensure good manufacturing practice in every federally inspected establishment, will provide a high degree of assurance that products meet compliance provisions for nutrient content claims. Accordingly, the proposed provisions requiring approved PQC programs for use of nutrient content claims (9 CFR 317.309(g)(8) and 381.409(g)(8)) have been removed in this final rule.

2. *Use of data bases.* FSIS's proposal to permit the use of data bases and recipe analysis using data bases was supported by most commenters. FSIS continues to believe that the use of data bases, alone or in conjunction with analytical testing, can facilitate cost effective development of accurate nutrient declarations for meat and poultry products, which meet the requirements of these regulations and provide highly useful information to consumers. FSIS concludes that data bases, especially computerized systems, when effectively used, are powerful tools for developing nutrient declarations. Consequently, the final rule will allow nutrient declarations based on data base values, direct analysis, and/or combination approaches. The Agency encourages firms to fully exercise their prerogative to use data bases to construct labels reflecting the average nutrient levels in their products over time.

As previously discussed, the Agency has prepared a manual to provide guidance and practical information to meat and poultry product manufacturers who choose to use data base values or recipe analyses using such values to develop nutrition label declarations for all or selected nutrients in their products. The document will help establishments, especially those with limited experience in nutrition labeling or data base use, evaluate and use systems to insure compliance with USDA's nutrition labeling regulations. FSIS wants to stress that it is not its intent to proceed in a punitive manner against companies when problems surface during compliance monitoring. FSIS will expect the company to locate the source of the discrepancy and rectify any problem by such means as changing the label values and correcting the cause of the problem. If problems surface during Agency compliance sampling FSIS will review company records and work with the company to assure that label values reflect average nutrient levels in the food product. FSIS expects the focus of any compliance inquiry about labels based on data base values to be somewhat different from those based on direct analysis because variation can be introduced from multiple sources.

a. *Single-ingredient products.* Commenters generally supported the Agency's proposal to allow use of representative data base values from USDA's NNDB or the AH–8 series, without being subject to the compliance provisions of the regulations in the absence of claims, on point-of-purchase information and on labels for generic labeling of fresh meat and poultry products according to the guidelines for the voluntary program. Representatives

of the poultry industry requested FSIS to allow alternatively for the use of industry-prepared, separate data bases and other recognized data bases, such as "Nutri-Facts," to provide the information because AH–8 may not be representative of current poultry.

In its proposal, the Agency stated that it accepted the results of the research efforts to develop the nutrient profiles for meat and poultry as contained in the NNDB or AH–8 as adequately characterizing beef, pork, lamb, veal, chicken, and turkey. These data have been screened and accepted by USDA's Human Nutrition Information Service and, therefore, FSIS believes it is appropriate to exclude products using these data for labeling purposes from compliance review in the absence of claims. FSIS also stated that it did not discourage the use of private data base values but that products so labeled would be subject to compliance review. Products labeled with both USDA's public data base values and with private data base values will be included in measuring substantial participation in the voluntary program. FSIS will not approve, certify, or otherwise accept private data bases for single-ingredient, raw products for the purpose of exempting products labeled with such information from the compliance provisions of these regulations. FSIS holds that the accuracy of the data in these private systems is the responsibility of the developer.

Several commenters from foreign countries requested either to use their own national data or that FSIS allow use of U.S. data to label imported, single-ingredient, raw products without such labeling being subject to compliance review. FSIS considers foreign, nationally representative data bases to be private data bases that it will not accept for the purpose of exemption from the compliance provisions of these regulations. As with domestic private data bases, the accuracy of the data in these systems is the responsibility of the developer. FSIS cannot know in advance the scope of the research behind data in private systems as is possible with USDA's NNDB. The Agency notes that nutrient profiles for raw cuts of New Zealand lamb as contained in AH–8–17 are given the same status as NNDB or AH–8 data with regard to the labeling of imported product. Imported products bearing other U.S. data for labeling will be subject to compliance review because the Agency has no way to assess the applicability of data developed specifically for the U.S. food supply to foreign food sources.

A number of trade associations and companies contended the voluntary system should apply to all single-ingredient products whether or not they have been thermally processed. They argued that there is little difference between thermally processed and non-thermally processed single-ingredient products, particularly when the labeling options of "as packaged" and "as consumed" for voluntary goods is taken into account.

The Agency understands the argument about thermally processed products considering that information on single-ingredient, raw products may be presented on a cooked basis. In its discussion of alternatives considered in development of its proposed regulations, FSIS stated its belief that consumers should be provided with nutrition labeled products to the extent possible for all foods. Because nutrient values for single-ingredient, raw meat and poultry products are not modified through various stages of preparation, consumers have reasonable expectation as to their nutritional values such that a voluntary program for these products is suitable. The Agency cited referenced USDA sources which contain both raw and cooked nutritional data appropriate for these products. The cooked values in these sources were developed using protocols that reflected home preparation to every extent possible. The Agency has no information that industrial thermal processing procedures do not introduce different variables than considered in developing the USDA data. For these reasons, FSIS concludes that inclusion of thermally processed single-ingredient products in the voluntary program is not warranted.

Many trade associations and companies held the opinion that the voluntary program should include single-ingredient, raw products subjected to such mechanical activities as grinding, cubing, cutting, and pressing, and that there should be no distinction between fresh products packed in official establishments and at the retail level. FSIS notes that it has made no distinction between fresh products packaged in official establishments and those packaged at the retail level. The Agency does not believe that the site where a product is packaged has any relevance for its nutritional profile. The voluntary program includes retail cuts of meat and poultry (and ground beef), including those that have been previously frozen, because the nutrient values for these products are not modified through various stages of preparation, such as cooking and heat processing. Single-ingredient, raw products which are subjected to mechanical treatments, such as slicing, chopping, and shaping, would likewise meet the definition describing products considered to be suitable for inclusion under the voluntary nutrition labeling program. The nutrient contents of final products from mechanical treatments would be identical to those of their starting cuts and such products could be labeled appropriately using pertinent USDA data base information.

Commenters suggested that the definition of fresh product as "single-ingredient" was too strict and could greatly deter the introduction of new, minimally processed products such as low fat products containing binders. The Agency does not believe that multi-ingredient products are appropriate for the voluntary program because their nutrient content can vary significantly from single-ingredient, raw products, due to addition of ingredients and other steps during the manufacturing process.

FSIS proposed that appropriate nutritional values for labeling of single-ingredient, raw products are values for meat cuts with external cover fat at trim levels reflecting current market practices, and values for poultry cuts with skin on. The Agency also proposed to permit the additional listing of nutrients for the separable lean of meat cuts and skinless poultry cuts as an option. Consumer groups supported the Agency's position, but many commenters representing the red meat and food marketing industries objected to it. The industries cited several surveys of consumer trimming behavior suggesting many people trim fat from meat and, to a lesser extent, remove skin from poultry prior to cooking or eating.

The Agency recently received the preliminary results of a September 1992 study, sponsored by the National Live Stock and Meat Board, on consumer fat trimming behavior with regard to beef and pork cuts. A copy of the preliminary results of the work entitled "Determination of Consumer Behavior Regarding the Trimming of Fat from Selected Beef and Pork Cuts," October 1992, is available for public review in the FSIS Hearing Clerk's office. Actual trimming habits were measured through laboratory examination of meal preparation wastes and individual family member plate wastes.

The preliminary results show that 68 of 71 households participating in the study trimmed fat from beef ribeye steaks and 53 of 59 households trimmed fat from pork loin chops, either before or after cooking and before eating. Considering the margin of error in the study and sources of bias, the Agency accepts the results as conclusive of

consumer trimming behavior for beef and pork, and interprets them to show that many consumers do trim some fat from meat prior to eating. Preliminary calculations indicated that the amount of fat actually consumed equaled about 25 percent of the difference between the percent fat in the cooked total edible tissues (separable lean plus separable fat) and the percent fat in the cooked separable lean for the beef cut. Calculations also indicated that the amount of fat actually consumed equaled about 50 percent of the difference between the percent fat in the cooked total edible tissues and the percent fat in the cooked separable lean for the pork cut.

The Agency believes that these 25 and 50 percent differences can not be ignored, therefore, separable lean values would not be appropriate for beef and pork cuts. FSIS will not change its proposed position. The study indicated that not all consumers trim all fat and that there are some consumers who trim no fat from meat. Therefore, FSIS has not changed its proposed position on appropriate nutrient values for labeling of single-ingredient, raw meat products. Appropriate values for cuts of red meat are edible portions of meat cuts with external cover fat at trim levels reflecting current marketing practices. Additional nutritional data may be presented on an optional basis for the edible portions of the separable lean of meat cuts.

The broiler industry sought more flexible use of data base information because non-standardized multiple packs currently sold will create a great deal of variation in the nutrition profiles of raw poultry products. Other commenters questioned which specific cuts of meat and poultry from the NNDB or AH–8 referenced sources could be used for labeling. FSIS does not intend to limit the cuts to the 35 meat cuts listed in proposed 9 CFR 317.344 and 10 poultry cuts listed in proposed 9 CFR 381.444. The 45 cuts were identified only as major cuts for purposes of measuring significant participation in the voluntary program. FSIS believes data for any cut of beef, pork, lamb, veal, chicken, and turkey contained in the referenced USDA sources are appropriate for use for labeling purposes. The data for cuts may be used singly or in combination to accommodate multiple packs. Different tissues for cuts may be combined allowing for their proportions by weight, when such information is available, following calculation procedures described in the AH–8 publications. When data base values are not used directly and computations are applied, the Agency encourages manufacturers to keep track of the proportions of each AH–8 item combined so that the Agency can be satisfied that the values are actually derived from AH–8 data. Data for organ meats and data for species other than the six identified may also be used at the manufacturer's discretion although such data may not have as solid a research basis as noted for retail cuts of the major species.

Comments were received about the list of 45 major cuts of meat and poultry and the presentation of data on either a raw or cooked basis. These comments and the Agency's response are discussed under Part II, Mandatory Nutrition Labeling and Part VI, Serving Sizes, respectively.

b. *All other products.* Numerous trade associations and manufacturers requested explicit sanction of data base use to develop nutrition labels for processed or multi-component products to alleviate the cost of chemical analyses. Some firms supplied information and/or data attesting to the accuracy of the data base approach.

In response, FSIS proposed specifically to allow use of data base values and recipe analysis, and requested input on criteria for effective use of data bases, guidelines to provide producers who choose to use this approach, availability of data bases, and any changes that might be warranted in the compliance criteria if data bases are used. Many commenters provided such input to assist FSIS in development of a final rule which permits use of data base values and recipe analysis for nutrition labeling. Two consumer groups and one major company expressed concern that the data base approach would lead to less accurate nutrition information on labels and that the nutritional verification of such information would most likely cancel any savings. The Agency believes that effective use of data bases can reduce dramatically the overall cost for supporting nutrition labels and can provide consumers with high quality, useful nutrient information. Accordingly, FSIS will permit the use of data base values and recipe analysis using data bases to support nutrition labeling of processed and multi-component products. FSIS places responsibility for label accuracy on manufacturers. They may derive the nutritional values for product labels by any means to result in compliance with the provisions of these regulations. FSIS will accept introduction of the existence of a data base and supporting data, such as company ingredient analysis, USDA or supplier data for ingredients, formulas, and calculations applied, as appropriate records supporting nutrition label declarations.

FSIS believes the use of nutrient data bases, especially computerized systems, offers a very powerful tool for the development of nutrition labels. However, their effective use is a complex issue involving considerations about completeness, accuracy, precision, and support. Many commenters asked the Agency to provide guidelines for data base use that are simple and concise. As previously discussed, FSIS has compiled relevant suggestions by experienced data base users into a manual to assist those meat and poultry processors who elect to employ this approach, copies of which are available from the Product Assessment Division.

Many small companies requested FSIS to provide the data base values or systems for computerized calculation and not hold users liable for any faulty data in such systems. FSIS does not believe that it is practical for it to provide data bases or computer systems to industry for use in calculating nutrient values. FSIS will provide guidance for effective use of data bases and computer systems in the manual, as well as information about appropriate composite species data and computations it believes applicable to products that are not highly formulated, and references to commercial sources of computer data base systems. However, use of the guidelines in the manual does not negate a manufacturer's responsibility for the accuracy of the nutrient information on its labels.

A number of commenters asked FSIS to evaluate and certify data bases and/or computerized recipe systems for acceptability either as a prerequisite to use or on a voluntary basis. The Agency does not believe it is either practical or warranted that it perform such a function. Available data bases and/or systems include publicly available material, such as USDA's Nutrient Data Base for Standard Reference, commercial systems, and companies' proprietary data bases. FSIS believes manufacturers should evaluate and select a system best suited to meet their own needs, taking into account their type of product, its ingredient formulation, and the processing procedures employed. General factors to consider in a data base selection process are provided in the FSIS manual to help guide potential users.

Most commenters responding to the question in the supplementary proposed rule about compliance parameters (57 FR 10298, March 25, 1992) expressed the opinion that compliance criteria in

nutrition labeling should be the same for all processed and multi-component products regardless of the data source. One trade association stated that products which are supported by data base values should be in a fundamentally different compliance category, whereby reference to the data base would essentially curtail a compliance inquiry in most cases. The suggestion was also made that USDA adopt compliance parameters that reflect product characteristics so that commodity-type products, when labeled according to an accepted national data base, should not be subject to compliance checks.

The Agency believes that compliance criteria that allow variation based on data sources, i.e., direct analysis, data base values, recipe calculations using data base values, and combinations of these approaches, would be inconsistent with the intent of nutrition labeling. It will hold manufacturers of all products not exempted from compliance review under provisions of these regulations to identical compliance parameters. FSIS expects the focus of any compliance inquiry about labels of products based on data base values and/or recipe analysis to be somewhat different from products based on direct analysis because variation can be introduced from multiple sources. Nonetheless, the Agency expects companies to locate the source of a discrepancy and take appropriate steps to correct errors.

A number of commenters said FSIS should not allow manufacturers of products bearing nutrient content claims to base the claims on data base values or recipe analysis and that FSIS should require chemical analysis to justify the validity of claims. The Agency maintains that the manufacturer is responsible for the accuracy of the claims and will not dictate that direct analysis must be conducted on nutrients which are the subject of claims. Because of the high visibility of claims and their use as marketing tools, manufacturers would place themselves at risk if claims cannot be adequately substantiated.

3. *Compliance parameters.* Many commenters addressed the 80/120 tolerance levels, commonly referred to as the 80/120 rule, for naturally occurring nutrients and the Agency's proposed sampling scheme. Approximately half were supportive of the proposed requirements as written. A number of large trade associations and companies offered alternative enforcement schemes or sought modifications of the tolerance levels to accommodate specific nutrients or single versus multi-lot sampling. Many requested FSIS to discuss the considerations it would make during a compliance inquiry and before it would deem a product to be misbranded because nutrients did not meet compliance provisions. Commenters cited situations where variations in processed products might cause compliance parameters to be exceeded unavoidably as follows: (a) Wide natural variation of nutrients in an ingredient; (b) decreases in nutrients during shelf life of a product; (c) variability of methods at low levels of nutrients; (d) adjustments for container fill; and (e) processing methods, such as retorting, which degrade certain nutrients. A few commenters held misconceptions that the 80 and 120 percent values represented the upper and lower bounds of an acceptable range for every nutrient and/or that products must be labeled at lot averages without allowance for safety factors.

The Agency shares the concerns that wide variation can be introduced due to natural variability of nutrients in foods and that some nutrients do change over the course of product shelf life. Examples of such cases are variable contents of fat in hams and sides of bacon from relatively uniform groups of market hogs and decreases over time in sodium ascorbate (vitamin C sodium) levels in fermented sausage, respectively. Therefore, the Agency is outlining its interpretation of the 80/120 rule, which it will adopt, and how it intends to determine a misbranding status. It is the Agency's position that declared nutrient values on food labels preferably should reflect average nutrient levels in the product produced or manufactured by a company or establishment within the company. The provisions of these regulations and other policies in regard to implementing these regulations are consistent with this position. The allowance in the 80/120 rule for nutrition labeling, developed by FDA and first implemented by that agency in 1974, is meant to take into account inherent manufacturing and product variation. The FDA approach was concentrated on single lot sampling. Under this scheme of sampling, lot-to-lot variation is not taken into account. However, compliance sampling of 12 subsamples within a lot does not imply that such a sample is adequate to develop the nutrition label.

FSIS compliance procedures will involve collecting samples from within a lot and use of results on samples that are collected from different lots, either at the establishment or at the wholesale/retail level. The sampling of product from different lots has the effect of decreasing the producer's risk that test results will not be in compliance compared to sampling of product from a single lot, provided that the product is produced under similar conditions. This type of sampling is consistent with the Agency's position that the nutrition label reflect the average level of nutrients in the product over time. FSIS has also adopted a strategy for some products of collecting six units instead of 12. The primary reason for this change is that the size of some products makes it difficult to mail, store, cook in some instances, and prepare homogeneous composites within the laboratory. Use of six units, instead of 12, will also reduce cost to the establishment when the samples are drawn at that site. The Agency believes that results based on six samples will provide reasonable assurance of accuracy, while offering considerable benefits. The Agency does not believe that this decrease in sample size warrants a statistical adjustment to the rule as it is being applied.

The Agency's experience with the 80/120 rule shows that it works well to ensure reliable label values for the majority of processed products, and is not overly burdensome. FSIS believes that the labeling strategy suggested by FDA in development of the 80/120 rule was based on using statistical procedures for guiding a producer in selecting a label value in order to be highly confident that sample results would satisfy the rule. FDA outlined a procedure which suggested that the nutrients in a food in a package must be within the 80/120 percent tolerances with high probability (95 percent) regardless of the average amounts of the food's nutrients in packages over time. If, in fact, nutrient variability were high, the manufacturer would be forced, under this procedure, to label above or below the average, depending on the nutrient, in order to satisfy the procedure. Also, in the case where variability was small, the label value could be below the average for so-called negative nutrients like calories, sodium, and fat and above the average for so-called positive nutrients like vitamins, minerals and protein. In either case, the average nutrient level in a food in a package would not agree with the label value.

FSIS, as mentioned previously, has adopted the policy that values on food labels preferably should reflect average nutrient levels in the food product. If this is achieved, it would enable consumers to have more accurate information over time than is possible with the FDA approach described above. The Agency recognizes that, for some nutrients in foods, natural

variability will be large, thereby increasing the probability of noncompliance under the 80/120 rule when the label value reflects average nutrient content. Consequently, the Agency will provide exemptions if it can be demonstrated that variability is unavoidably high due to inherent nutrient variation in a product or product ingredient, which cannot be controlled under normal processing. This type of variation is shown with carrots, an ingredient in some meat and poultry products. The vitamin A activity of carrots varies extensively and increases with maturity at harvest. However, variation caused by changes in proportions of ingredients, such as beef and pork in a frankfurter, would not qualify a product for an exemption.

The Agency will use the FDA procedure as a guideline to determine high variability. If a manufacturer labels at the average, and if the standard deviation of values within a lot is 42 percent of the mean, i.e., the coefficient of variation (CV) equals 42 percent, then there is a 95 percent probability that analytical results on 12 samples will satisfy the 80 or 120 percent criteria when analytical variability is ignored. This 42 percent value can be used as a guideline for exemptions based on inherent nutrient variability. When six samples are taken, 95 percent probability of satisfying the criteria is achieved when the CV equals 30 percent. This 30 percent value will be used as a guideline for providing exemptions for those products on which only six samples will be drawn.

When Agency test sample results are not in compliance with the 80/120 rule, FSIS will expect the company to indicate how it will rectify the problem. Actions may include changing the label values or identifying and correcting the cause of the problem. Alternatively, the company could notify the Agency that it is going to present data or information to support the label. The company could either present data that shows to the Agency's satisfaction that the sample result found not in compliance is not representative or likely to reoccur under the establishment's normal processing. Alternatively, the company could present evidence to relax the 80/120 tolerance because of unavoidable variability, either because of large within lot variability as described above, or because of large processing variability caused by product variation over the year.

In order for the Agency to accept the label value as stated, information presented during a compliance inquiry should demonstrate that the company satisfies the Agency's goal to have the label value reflect the average. Such effort could be demonstrated by data showing, with 80 percent statistical confidence, that the label value is equal to or less than the process mean value for nutrients where the 80 percent tolerance applies. In addition, the company must show consistent processing to ensure that only low percentages of future samples would not be in compliance. Such consistency could be shown by data demonstrating process control to the extent that there is expected to be less than a 10 percent probability that the mean result from a composite of six or 12 units within a lot, as appropriate, would not be in compliance. Similarly, for nutrients where the 120 percent tolerance applies, the Agency would be satisfied and accept the label value if the company can show that there is 80 percent statistical confidence that the process mean value for the product is equal to or less than the label value, and also that there is expected to be less than a 10 percent probability that the mean result from a composite of six or 12 units within a lot, as appropriate, would not be in compliance. The results used in these statistical computations should be rounded to one additional significant digit beyond the prescribed label increment for the nutrient. This rounding requirement will increase the accuracy of the evaluation.

If the company wishes to relax the 80/120 rule, then it should provide FSIS records of data collected under good manufacturing practice that would provide evidence to relax the 80/120 rule based on unavoidable variability with the intent of judging a product on its time weighted average nutritional profile over a year. The company has to present information which will explain and document the unavoidable variability. This would include amounts of raw materials that are generally used in processing, together with nutrient information on these materials, as well as data showing process variability under good manufacturing practices. For example, variation in fat content of bacon might be due to variation in fat content of the pork source material from different suppliers producing carcasses of different yield grades. Relaxation of the 80/120 rule will be made when it can be shown that nutrient levels in raw products are of high variability over time, or that there is a high amount of within lot variability as described above.

The Agency concludes that it is not necessary to alter the provisions of proposed 9 CFR 317.309(g)(4)(ii) and (5) or 381.409(g) (4)(ii) and (5) to incorporate the above stated policies to implementing the compliance provisions of these regulations. However, FSIS has modified proposed 9 CFR 317.309(g)(2) and 381.409(g)(2) to allow individual samples to be analyzed and the results averaged by adding a third sentence to read "In each case, the units may be individually analyzed and the results of these analyses averaged." The Agency has also corrected errors at proposed 9 CFR 317.309(g)(6) and 318.409(g)(6), the meaning of which was questioned by two trade associations. These provisions are changed to read "The amount of a vitamin, mineral, protein, total carbohydrate, dietary fiber, other carbohydrate, polyunsaturated or monounsaturated fat, or potassium may vary over the labeled amounts within good manufacturing practice. The amount of calories, sugars, total fat, saturated fat, cholesterol, or sodium may vary under the labeled amounts within good manufacturing practice." The purpose of these provisions is to prevent large understatements of vitamins, etc., and overstatements of calories, etc., on labels as compared to amounts actually present in analyzed composites. For example, if a product is labeled at 100 calories, an analyzed composite's caloric value may be no higher than 120 calories for the sample to be found in compliance. However, if the analyzed sample is found to contain only 20 calories, the product may be misbranded, because the Agency would consider the value to be outside the levels generally expected during good manufacturing practices. The Agency could ascertain this either by data collected from the manufacturers or data collected through its own monitoring program. While the Agency does not preclude adjustments in label declarations to minimize risk of noncompliance, it encourages manufacturers to label close to average values and, as discussed above, will take into consideration inherent nutrient variability and shelf stability factors when nutrients in products fall outside the 80/120 tolerance levels.

Some commenters contended that nutrients present at low concentrations are particularly susceptible to compliance problems due to method variability and rounding procedures. They argued that if a process mean value of 1.3 units were rounded for label declarations to one unit, then the acceptable range would be 0.8 to 1.2 units when applying the 80/120 rule. The range would be below the true mean value which could result in many products being found not in compliance. Furthermore, these small differences of 0.2 units may not be

within the accuracy of many methods so that the analytical variance could be greater than the allowed regulatory variance.

FSIS points out that the 20-percent tolerance does not represent a range but rather a discrepancy of an analytical result on a sample from a label value. FSIS believes that the point that the commenters wish to make is that, for class II nutrients such as fat and sugars, the upper bound for a label claim of 1 would be 1.2, which, in the example presented, is below the mean. In response, FSIS believes it is the manufacturer's responsibility to target values to correspond to an appropriate label declaration so products will meet compliance requirements. This includes taking into consideration the effects of rounding. In this example, FSIS would expect the label to indicate 1.5 units for fat and 2 units for sugars.

The Agency also recognizes that analytical variability may be larger at low nutrient levels. For this reason, FSIS proposed at 9 CFR 317.309(g)(4)(ii) and 381.409(g)(4)(ii) for vitamins, minerals, protein, total carbohydrate, dietary fiber, etc., that no regulatory action will be taken unless the nutrient level found in the product exceeds both the 20-percent tolerance and whatever variability is recognized for the particular method being used at the nutrient level involved. FSIS believes this same provision should apply to all nutrients. The Agency has added the provision for allowance for method variability at proposed 9 CFR 317.309(g)(5) and 381.409(g)(5) to cover calories, sugars, total fat, saturated fat, cholesterol, and sodium. FSIS does not believe that incorporation into the regulations of any other explicit provision or compliance position for low level nutrients or small labeling increments, such as 2 percent, would provide added protection for manufacturers.

Several commenters stated that container fill, specifically over fill to assure compliance with declared quantity of contents, will contribute errors under the proposed definition for single-serving containers, which will use the entire contents of the container in determining compliance. FSIS does not consider this issue to be a valid concern. While the entire contents of a container will be used to prepare the sample for analysis, the Agency will not use the actual weight of the contents in determining compliance. FSIS will use the precise metric weight equivalent of the serving or portion size, fluids in milliliters and all other foods in grams, which is required to be included on the label, for compliance purposes. For purposes of clarity, the Agency is adding a provision at proposed 9 CFR 317.309(g) and 381.409(g) to state specifically that this metric measure will be used for compliance purposes.

While discussing nutrient variability, some trade associations and companies said manufacturing processes, such as heat treatments, alter nutrients. The Agency holds that such losses must be accounted for either by finished product testing or by use of yield and retention factors, as appropriate, during recipe analysis. The latter considerations are discussed in the FSIS manual on use of data bases.

Industry groups said decision criteria for compliance should be based on actual, unrounded values used in compiling the label information. If FSIS unrounded compliance sample data were compared to rounded label declarations, whether the industry source data came from direct analyses or data bases, errors in data interpretation might result. Because the Agency has dropped the requirement for submission of company data with initial label approvals, FSIS must make initial comparisons with label declarations. However, in the event of a compliance inquiry, FSIS will examine the company's records and make decisions using the company's original, unrounded values.

A few large companies sought clarification as to why FSIS defined and established tolerances for class I nutrients; i.e., those added in fortified and fabricated foods, noting that FSIS has not allowed fortification of meat and poultry products. In the preamble to the proposed rule, FSIS stated that it had little experience with added nutrients unless specific regulations permit their addition, e.g., vitamin A to margarine (9 CFR 319.700). The Agency proposed to define class I nutrients in these regulations to cover this situation. The use of nutrients solely for technological purposes, e.g., in curing meats to use L-ascorbic acid (vitamin C) or its sodium salt (sodium ascorbate) to accelerate color fixing or preserve color during storage, would not subject the added nutrient in the product to the class I compliance criteria shown at proposed 9 CFR 317.309(g)(4)(i) and 381.409(g)(4)(i). Similarly, the use of ingredients such as "textured vegetable protein" or enriched flour in a product would not subject the product to any class I criteria simply because the word "protein" is in an ingredient name or nutrients had been added to an ingredient of the product. The Agency also notes that if voluntary vitamins and minerals are required to be added or permitted in a standardized food (e.g., thiamin in enriched flour), which is used as an ingredient in a meat or poultry product, or if they are included solely for technological purposes and declared only in the ingredient statement, they need not be declared on the label if not otherwise referred to on the label or in labeling or advertising. The Agency believes that further discussion of its fortification policy is beyond the scope of this rulemaking.

A number of commenters expressed concerns about the need to analyze for nutrients which are not indigenous to meat or poultry products, e.g., dietary fiber in muscle meat tissue, stating that to analyze for "zero" level nutrients would be costly and a waste of time. FSIS does not expect manufacturers to conduct analyses for nutrients that are not present in a food or even to run tests to establish that fact unless there is reasonable doubt about the nutrient's presence or as to whether the level would round to "zero" for the label declaration. Knowledge of the food and information on its ingredient formulation and processing, review of food composition tables, consultation with nutritionists, food scientists, and others can all show that only certain nutrients should be targeted for analysis in specific foods or products. To undertake analyses for all mandatory nutrients in such situations would be a waste of resources.

Regarding analytical methodology, commenters stressed the importance that methods used for regulatory compliance by FSIS and FDA be the same except to the extent where the unique characteristics of meat and poultry products dictate a different method. Both the FSIS "Chemistry Laboratory Guidebook" and the "Official Methods of Analysis" of the AOAC International, formerly Association of Official Analytical Chemists, were recognized as appropriate sources of chemical methodology. Commenters said the "Guidebook" must be updated and include references for all required nutrients and that specific reference to the 15th edition, 1990, of the AOAC should not be made because, when subsequent editions are printed, the regulations will reference obsolete material. It was also noted that some AOAC methods are not current with contemporary analytical procedures and that there is a need to develop better, more reliable analytical methods subject to collaborative studies. The AOAC International Board of Directors established a Task Force on Nutrient Labeling Methods charged with identifying deficiencies in current methods and expediting key

collaborative studies. Many commenters also requested specific guidance as to the analytical procedures the Agency will use to enforce these regulations at the time the final rule is published.

The Agency agrees with the majority of these comments concerning analytical methodology and the goals of the AOAC Task Force on Nutrient Labeling Methods. USDA's Agricultural Research Service, FSIS and FDA are actively participating in the AOAC deliberations, as well as in development of appropriate standard reference materials for chemical analyses. FSIS recognizes that some of the methods now in use may be changed in the next several years in order to better meet nutrition labeling needs. Such changes, when accepted by the Agency, will be incorporated into the "Chemistry Laboratory Guidebook," which will be updated on an ongoing basis. In regard to the suggestion to delete the reference to the 15th edition of the AOAC, FSIS does not have the authority to delete such reference. The Office of the Federal Register requires that each statement of incorporation by reference into the Code of Federal Regulations contain specific information, including the date and edition of the publication. This is required because all incorporated material, like any other properly issued regulation, has the force and effect of law.

Accordingly, FSIS has modified the proposed 9 CFR 317.309(g)(2) and 381.409(g)(2) to change the cross reference to 21 CFR 101.9(c) to 9 CFR 317.309(b) for meat and 9 CFR 381.409(b) for poultry. The Agency also notes that the provisions at 317.309(h)(2) and 381.409(h)(2) state that, if no USDA, AOAC, or specified method is available or appropriate, that other reliable and appropriate analytical procedures should be used. Other reliable and appropriate procedures may not have been collaboratively tested, but rather include validated methods, published peer-reviewed methods and correlated methods. Because they are not necessarily fully characterized, like official methods, they are not specified. In the preamble to the proposed rule, FSIS said that if use of a method will result in a significant (10 percent or greater) under-representation of a caloric value or misrepresentation of an available nutrient such that the nutrients whose intakes should be limited appear to be present at lower levels than is actually the case, then a more appropriate method of analysis should be used. These provisions have relevance, for example, to products containing a large proportion of fat as phospholipid, which is not quantitatively extracted with ether.

The "Chemistry Laboratory Guidebook" is now in the process of being updated but is not yet available. For this reason and to provide commenters with specific guidance as to the methods for required nutrients, moisture, and ash that it will use for compliance purposes, FSIS has listed below the method citations with brief clarifying descriptions and/or additional considerations. A full description of the procedures, including measures of analytical variability, as well as any changes made for considerations outlined below or in response to Federal or AOAC deliberations prior to publication of the updated guidebook, will appear in the revised version. Further information about analytical methods may be obtained from the Chemistry Division, Science and Technology, Food Safety and Inspection Service, U.S. Department of Agriculture, Washington, DC 20250.

FSIS Methods for Nutritional Analysis

- Calories—At 317.309(b) and 381.409(b). Calculated using specific Atwater factors; general factors of 4, 4, 9; general factors of 4, 4, 9 after subtracting insoluble dietary fiber from total carbohydrate, if desired; or, specific food factors approved by FDA.
- Moisture—AOAC, 15th ed., 1990, 950.46B. Air Drying; or AOAC, 15th ed., 1990, 950.46. Vacuum Oven.
- Total Fat—FSIS has tested several procedures to measure fat on various meat and poultry products, including AOAC, 15th ed., 1990, 960.39 using petroleum ether as solvent. The Agency is currently testing methods to measure only the total lipid fatty acids to be expressed as triglycerides, which constitute total dietary fat as defined in this final rule. More information will be provided as soon as it is available.
- Saturated Fat—Lipid Manual, "Methodology Appropriate for Fatty Acid-Cholesterol Analysis," 1992. U.S. Food and Drug Administration. Wm. C. Brown Publishers, Dubuque, IA, 109 pp. FSIS will use capillary columns, and the shortest chain fatty acid to be measured will be butyric acid.
- Cholesterol—Lipid Manual, "Methodology Appropriate for Fatty Acid-Cholesterol Analysis," 1992. U.S. Food and Drug Administration. Wm. C. Brown Publishers, Dubuque, IA, 109 pp. FSIS will use capillary columns.
- Total Carbohydrate—At § 317.309(b) and § 381.409(b). Determined by difference.
- Sugars—Chemistry Laboratory Guidebook, Revised Basic, 1987, 3.022. Dextrose, Sucrose, Maltose, and Lactose by HPLC.
- Dietary Fiber—AOAC, 15th ed., 1990, 985.29. Enzymatic Gravimetric Method; or AOAC, 15th ed., 1990: 3rd Supplement, 1992, 991.43. Enzymatic Gravimetric Method, MES-TRIS Buffer. Special precautions are needed to ensure that meat and poultry product samples are thoroughly defatted prior to analysis.
- Other Carbohydrate—At § 317.309(b) and § 381.409(b). Determined by difference.
- Protein—Chemistry Laboratory Guidebook, Revised Basic, 1987, 3.002. Kjeldahl.
- Ash—AOAC, 15th ed., 1990, 920.153.
- Vitamin A—High Pressure Liquid Chromatography. In-house FDA procedure. FSIS will measure preformed retinol and beta-carotene separated from other vitamin A precursors. The Agency will not make a noncompliance finding for this nutrient when a company includes other vitamin A active carotenoids in compiling the label declaration where data for such carotenoids have been determined using appropriate methods and the activity has been calculated using the factor of one retinol equivalent equal to 12 micrograms of these other carotenoids.
- Vitamin C—FSIS is studying the procedure of Vanderslice, J.T. and Higgs, D.J. 1990. "Separation of ascorbic acid, isoascorbic acid, dehydroascorbic acid and dehydroisoascorbic acid in food and animal tissue". J. Micronutrient Anal. 7, 67–70. This HPLC procedure can distinguish between L-ascorbic acid (and sodium ascorbate) and isoascorbic; i.e., erythorbic acid (and its sodium salt, sodium erythorbate), which is commonly used in meat and poultry products but has little or no vitamin C activity. FSIS has not yet determined whether this method is reliable. The Agency will use this procedure if reliability is established. FSIS is also studying the procedure of the International Organization of Standardization (ISO), 1990–09. "Meat and Meat Products—determination of L(+)—ascorbic acid—HPLC method", Document 34–SC6N337.
- Sodium—Chemistry Laboratory Guidebook, Revised Basic, 1987, 4.010. Using Inductively Coupled Plasma Optical Emission Spectrometry.
- Iron and Calcium—Analytical Chemistry Laboratory Guidebook, Residue Chemistry, Winter 1991. MTL. Inductively Coupled Plasma Optical Emission Spectrometry.

FSIS is extending this procedure to include calcium. FSIS notes that it does

not prescribe methods which must be used by manufacturers to support label values. The methods listed above are those the Agency will use to analyze samples for enforcement purposes. The Chemistry Division will make copies of single nutrient analyses available at interim periods between publications of the Chemistry Laboratory Guidebook.

IX. Health Claims

FSIS does not currently permit health claims explicitly linking food attributes to diet-related disease or health-related conditions. FSIS does permit statements informing consumers that a food can be part of a specific dietary pattern to meet an organization's dietary guidelines or that a food was developed to help follow a specific dietary pattern.

The rationale adopted by FSIS for approving health claims on labeling is to encourage labeling which supplements the information contained in the nutrition label with information that provides truthful data about a product's nutritional characteristics, and provides generally accepted information about how a product satisfies consumers' total dietary requirements. By contrast, labeling is not approved by FSIS under the FMIA or PPIA if the Secretary of Agriculture has reason to believe that the claim is false or misleading in any particular.

To implement the use of health claims on labeling, FSIS provides general guidelines and objectives which permit claims if they are based on a consensus of medical and scientific information, emphasize that good nutrition is a function of the total diet, and are reasonably uniform from product to product.

The following is an example of a health-related claim that would currently be permitted: "This food was specifically developed to help you follow the current U.S. Dietary Guidelines for sodium, fat and cholesterol. For further information on the U.S. Dietary Guidelines call * * *"

In its proposed rule on nutrition labeling, FSIS stated its intent to publish a proposed rule on health claims in line with FDA's proposal. At the time the FSIS proposal was published, the health claims issue was still under study by FDA and FSIS. FSIS is continuing its study of this issue and plans to publish a proposed rule in the near future.

X. Food Ingredients and Standards of Identity

FSIS requires full ingredient labeling on all meat and poultry products, including standardized products.

The Agency believes that concerns about disjunctive labeling of fats and oils can be resolved by proper labeling of saturated fat. Because USDA standards of identity and composition do not require minimum fat contents, development of products with desirable characteristics is not hampered by minimum fat criteria. However, levels for minimum amounts of meat and poultry are a part of most standards. These criteria protect consumers against economic fraud and dilution of beneficial micronutrients and protein expected in certain products. Due to the shift of concern from problems connected to underconsumption to those associated with overconsumption of certain food components such as fat, FSIS plans to reassess this matter after completing its rulemaking on nutrition labeling.

XI. Prior Label Approval

FSIS is considering changes to its current label approval process for labeling of meat and poultry products. At this time, two options are being considered: (1) Revising the current system by significantly reducing the scope of review, through expanding the categories of labeling that would be generically approved, and replacing the current general requirement of FSIS approval of final labeling with one for sketch labeling only; and (2) replacing the current system with a system in which all labeling would be generically approved and used without prior submission to FSIS. FSIS published an ANPR in the **Federal Register** on March 25, 1992 (57 FR 10300), requesting comments from interested parties on these two options. FSIS plans to issue a proposed rule based on comments received on the ANPR.

List of Subjects

9 CFR Part 317

Food labeling, Food packaging, Incorporation by reference, Meat inspection.

9 CFR Part 320

Meat inspection, Reporting and recordkeeping requirements.

9 CFR Part 381

Food labeling, Incorporation by reference, Poultry and poultry products, Reporting and recordkeeping requirements.

Final Rule

For the reasons discussed in the preamble, FSIS is amending 9 CFR parts 317, 320, and 381 of the Federal meat and poultry products inspection regulations as follows:

PART 317—LABELING, MARKING DEVICES, AND CONTAINERS

1. The authority citation for part 317 continues to read as follows:

Authority: 21 U.S.C. 601–695; 7 CFR 2.17, 2.55.

2. Part 317 is amended by designating the current sections 317.1 through 317.24 as subpart A—General, and by adding a new subpart B—Nutrition Labeling to read as follows:

Subpart B—Nutrition Labeling

Sec.

Subpart B—Nutrition Labeling

§ 317.300 Nutrition labeling of meat products.

(a) Nutrition labeling shall be provided for all meat products, except single-ingredient, raw products, in accordance with the requirements of § 317.309; except as exempted under § 317.400 of this Subpart.

(b) Nutrition labeling may be provided for single-ingredient, raw meat products in accordance with the

requirements of §§ 317.309 and 317.345. Significant participation in voluntary nutrition labeling shall be measured by the Agency in accordance with §§ 317.343 and 317.344 of this Subpart.

§ 317.301 [Reserved]

§ 317.302 Location of nutrition information.

(a) Nutrition information on a label of packaged meat products shall appear on the label's principal display panel or on the information panel, except as provided in paragraph (b) of this section.

(b) Nutrition information for gift packs may be shown at a location other than on the product label, provided that the labels for these products bear no nutrition claim. In lieu of on the product label, nutrition information may be provided by alternate means such as product label inserts.

§§ 317.303–317.307 [Reserved]

§ 317.308 Labeling of meat products with number of servings.

The label of any package of a meat product that bears a representation as to the number of servings contained in such package shall meet the requirements of § 317.2(h)(10).

§ 317.309 Nutrition label content.

(a)(1) All nutrient and product component quantities shall be declared in relation to a serving or to a portion, as defined in 21 CFR 101.9(b) (1) and (2) except (b)(2)(i), and 21 CFR 101.9(b) (5) through (9) except (b)(5)(iii).

(2) The declaration of nutrient and product component content shall be on the basis of the product "as packaged" for all products, except that single-ingredient, raw products may be declared on the basis of the product "as consumed" as set forth in § 317.345(a)(1). In addition to the required declaration on the basis of "as packaged" for products other than single-ingredient, raw products, the declaration may also be made on the basis of "as consumed," provided that preparation and cooking instructions are clearly stated.

(3) For products in discrete units (e.g., hotdogs, and individually packaged products within a multi-serving package), serving size shall be the number of whole units that most closely approximates the Reference Amount for the Product Category. If a unit weighs 67 percent or more, but less than 200 percent of the Reference Amount, serving size shall be one unit. If a unit weighs more than 50 percent but less than 67 percent of the Reference Amount, the manufacturer may decide whether one unit is one serving. If a unit weighs 200 percent or more of the Reference Amount, the manufacturer may declare the whole unit as one serving if the whole unit can reasonably be consumed at a single-eating occasion.

(4) Serving size for meal-type products as defined in § 317.313(l) shall be the entire content (edible portion only) of the package.

(5) Another column of figures may be used to declare the nutrient and food component information in the same format as required by § 317.309(e),

(i) Per 100 grams, 100 milliliters, or 1 ounce of the food as packaged or purchased.

(ii) Per one unit if the serving size of a product in discrete units in a multi-serving container is more than one unit.

(6) If cups, tablespoons and teaspoons, or units such as piece, slice, tray, jar, or fraction are not applicable, ounces may be used. Ounce measurements shall be expressed in 0.5 ounce increments most closely approximating the Reference Amount, with rounding indicated by use of the term "about" (e.g., about 2.5 ounces).

(b) The declaration of nutrition information on the label shall contain the following information, except for that which is identified as "VOLUNTARY" or for those meat products where a simplified format may be used as provided for in paragraph (g) of this section or as in § 317.400(b). No nutrients or food components, other than those listed in 21 CFR 101.9(c) as either voluntary or mandatory, except for stearic acid, may be included within the nutrition label. Information shall be presented using the nutrient names specified and in the formats specified in paragraph (e) of this section. Definitions, units of measure, increments for declaring values, and methods of calculation shall be in accordance with 21 CFR 101.9 (c)(1) through (c)(9), except 21 CFR 101.9(c)(1)(i)(E), bomb calorimetry, and in 21 CFR 101.9(c)(7)(ii), use of nitrogen conversion factors, other than 6.25.

(c)(1) If a product consists of assortments of meat products (e.g., variety packs) in the same package, nutrient content shall be expressed on the entire package contents or on each individual product.

(2) If a product is commonly combined with other ingredients or is cooked or otherwise prepared before eating, and directions for such combination or preparations are provided, another column of figures may be used to declare the nutrient contents on the basis of the product as consumed for the product alone (e.g., a cream soup mix may be labeled with one set of Daily Values for the dry mix (per serving), and another set for the serving of the final soup when prepared (e.g., per serving of cream soup mix and 1 cup of vitamin D fortified whole milk)): *Provided*, That the type and quantity of the other ingredients to be added to the product by the user and the specific method of cooking and other preparation shall be specified prominently on the label.

(d) "Stearic acid" may be declared "VOLUNTARY." If stearic acid is declared "VOLUNTARY" a statement of the number of grams of stearic acid shall be included under saturated fat content and expressed to the nearest 0.5 (1/2) gram increment below 3 grams and to the nearest gram increment above 3 grams.

(e) Formats for nutrition labeling shall be in accordance with 21 CFR 101.9 (d) and (e) except for references to (f), (j)(5), and (j)(13), or in accordance with paragraph (g)(1) of this section.

(f) Foods in packages that have a total surface area available to bear labeling of 40 or less square inches may modify the requirements of paragraphs (b), (e), and (g) of this section and § 317.302(a) by one or more of the following means:

(1) Presenting the required nutrition information in a tabular or linear (i.e., string) fashion, rather than in vertical columns, if the package shape or size cannot accommodate a column display on any label panel. Nutrition information may be given in a linear fashion only if the label will not accommodate a tabular display and, in that case, subcomponents (e.g., saturated fat shall be declared in parentheses after total fat).

(2) Using any of the following abbreviations:

Serving size—Serv. size
Servings per container—Servings
Calories from fat—Fat cal
Saturated fat—Sat fat
Cholesterol—Cholest
Total carbohydrate—Total carb
Dietary fiber—Fiber

(3) Omitting the footnote and caloric conversion information required in paragraphs (d)(9) and (d)(10) of 21 CFR 101.9 and placing another asterisk at the bottom of the label followed by the statement "Percent Daily Values are based on a 2,000 calorie diet" and, if the term "Daily Value" is not spelled out in the heading, a statement that "DV" represents "Daily Value," and

(4) Presenting the required nutrition information on any other label panel.

(g)(1) Nutrition information may be presented in a simplified format as set forth herein when any required nutrients, other than the core nutrients,

are present in insignificant amounts. An insignificant amount shall be defined as that amount that may be rounded to zero in nutrition labeling, except that for total carbohydrate, dietary fiber, and protein, it shall be an amount less than 1 gram.

(2) The simplified format shall include: Serving size, number of servings per container, calories, total fat (grams), total carbohydrate (grams), protein (grams), and sodium (milligrams).

(3) Any nutrient, other than a core nutrient, that is present in an insignificant amount may be omitted from the tabular listing, provided that the following statement is included within the nutrition label, "Not a significant source of _____." The blank shall be filled in with the appropriate nutrient or food component.

(4) The omission of the listing of daily values and the caloric conversion information, and the expression of the percent of daily value in the simplified format shall be in accordance with 21 CFR 101.9(f)(5) except for references to (j)(5) and (j)(13).

(h) Compliance with this section shall be determined as follows:

(1) A production lot is a set of food production consumer units that are from one production shift. Alternatively, a collection of consumer units of the same size, type, and style produced under conditions as nearly uniform as possible, designated by a common container code or marking, constitutes a production lot.

(2) The sample for nutrient analysis shall consist of a composite of a minimum of six consumer units, each from a production lot. Alternatively, the sample for nutrient analysis shall consist of a composite of a minimum of six consumer units, each randomly chosen to be representative of a production lot. In each case, the units may be individually analyzed and the results of the analyses averaged, or the units would be composited and the composite analyzed. In both cases, the results, whether an average or a single result from a composite, will be considered by the Agency to be the nutrient content of a composite. All analyses shall be performed by appropriate methods and procedures used by the Department for each nutrient in accordance with the "Chemistry Laboratory Guidebook," or, if no USDA method is available and appropriate for the nutrient, by appropriate methods for the nutrient in accordance with the 1990 edition of the "Official Methods of Analysis" of the AOAC International, formerly Association of Official Analytical Chemists, 15th ed., which is incorporated by reference, unless a particular method of analysis is specified in § 317.309(b), or, if no USDA, AOAC, or specified method is available and appropriate, by other reliable and appropriate analytical procedures as so determined by the Agency. The "Official Methods of Analysis" is incorporated as it exists on the date of approval. This incorporation by reference was approved by the Director of the Federal Register in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. Copies may be purchased from the AOAC International, 2200 Wilson Blvd., suite 400, Arlington, VA 22201. It is also available for inspection at the Office of the Federal Register Information Center, suite 700, 800 North Capitol Street, NW., Washington, DC.

(3) Two classes of nutrients are defined for purposes of compliance:

(i) Class I. Added nutrients in fortified or fabricated foods; and

(ii) Class II. Naturally occurring (indigenous) nutrients. If any ingredient which contains a naturally occurring (indigenous) nutrient is added to a food, the total amount of such nutrient in the final food product is subject to Class II requirements unless the same nutrient is also added, which would make the total amount of such nutrient subject to Class I requirements.

(4) A product with a label declaration of a vitamin, mineral, protein, total carbohydrate, dietary fiber, other carbohydrate, polyunsaturated or monounsaturated fat, or potassium shall be deemed to be misbranded under section 1(n) of the Federal Meat Inspection Act (21 U.S.C. 601(n)(1)) unless it meets the following requirements:

(i) Class I vitamin, mineral, protein, dietary fiber, or potassium. The nutrient content of the composite is at least equal to the value for that nutrient declared on the label.

(ii) Class II vitamin, mineral, protein, total carbohydrate, dietary fiber, other carbohydrate, polyunsaturated or monounsaturated fat, or potassium. The nutrient content of the composite is at least equal to 80 percent of the value for that nutrient declared on the label; *Provided,* That no regulatory action will be based on a determination of a nutrient value which falls below this level by an amount less than the variability generally recognized for the analytical method used in that product at the level involved, and inherent nutrient variation in a product.

(5) A product with a label declaration of calories, sugars, total fat, saturated fat, cholesterol, or sodium shall be deemed to be misbranded under section 1(n) of the Federal Meat Inspection Act (21 U.S.C. 601(n)(1)) if the nutrient content of the composite is greater than 20 percent in excess of the value for that nutrient declared on the label; *Provided,* That no regulatory action will be based on a determination of a nutrient value which falls below this level by an amount less than the variability generally recognized for the analytical method used in that product at the level involved, and inherent nutrient variation in a product.

(6) The amount of a vitamin, mineral, protein, total carbohydrate, dietary fiber, other carbohydrate, polyunsaturated or monounsaturated fat, or potassium may vary over labeled amounts within good manufacturing practice. The amount of calories, sugars, total fat, saturated fat, cholesterol, or sodium may vary under labeled amounts within good manufacturing practice.

(7) Compliance will be based on the metric measure specified in the label statement of serving size.

(8) The management of the establishment must maintain records to support the validity of nutrient declarations contained on product labels. Such records shall be made available to the inspector or any duly authorized representative of the Agency upon request.

(9) The compliance provisions set forth in paragraph (h) (1) through (8) of this section shall not apply to single-ingredient, raw meat (including ground beef) products, including those that have been previously frozen, when nutrition labeling is based on the most current representative data base values contained in USDA's National Nutrient Data Bank or its published form, the Agriculture Handbook No. 8 series available from the Government Printing Office.

§ 317.310 [Reserved]

§ 317.311 [Reserved]

§ 317.312 Reference amounts customarily consumed per eating occasion.

(a) The general principles followed in arriving at the Reference Amounts for serving (portion) sizes set forth in paragraph (b) of this section are found in 21 CFR 101.12(a), (c), (d) and (g).

(b) The following Product Categories and Reference Amounts shall be used as the basis for determining serving sizes for specific products:

TABLE 1.—REFERENCE AMOUNTS CUSTOMARILY CONSUMED PER EATING OCCASION—INFANT AND TODDLER FOODS [1,2,3]

Product category	Reference amount
Infant & Toddler Foods:	
Dinner Dry Mix	15 g
Dinner, ready-to-serve, strained type	60 g
Dinner, soups, ready-to-serve junior type	110 g
Dinner, stew or soup ready-to-serve toddlers	170 g

[1] These values represent the amount of food customarily consumed per eating occasion and were primarily derived from the 1977–1978 and the 1987–1988 Nationwide Food Consumption Surveys conducted by the U.S. Department of Agriculture.

[2] Unless otherwise noted in the Reference Amount column, the Reference Amounts are for the ready-to-serve or almost ready-to-serve form of the product (i.e., heat and serve). If not listed separately, the Reference Amount for the unprepared form (e.g., dehydrated cereal) is the amount required to make one Reference Amount of the prepared form.

[3] Manufacturers are required to convert the Reference Amount to the label serving size in a household measure most appropriate to their specific product using the procedures established by regulation.

TABLE 2.—REFERENCE AMOUNTS CUSTOMARILY CONSUMED PER EATING OCCASION—GENERAL FOOD SUPPLY [1,2,3,4,5]

Product category	Reference amount	Reference amount
	Ready-to-serve	Ready-to-cook
Egg mixtures, (western style omelet, souffle, egg foo young	110 g	n/a.
Lard, margarine, shortening	1 tbsp	n/a.
Salad and potato toppers; e.g., bacon bits	7 g	n/a.
Bacon (bacon, beef breakfast strips, pork breakfast strips, pork rinds)	15 g	54 g=bacon. 30 g = breakfast strips.
Dried; e.g., jerky, dried beef, Parma ham sausage products with a moisture/protein ratio of less than 2:1; e.g., pepperoni	30 g	n/a.
Snacks; e.g., meat snack food sticks	30 g	n/a.
Luncheon meat, bologna, Canadian style bacon, pork patlie crumbles, beef patlie crumbles, blood pudding, luncheon loaf, old fashioned loaf, berlinger, bangers, minced luncheon roll, thuringer, liver sausage, mortadella, uncured sausage (franks), ham and cheese loaf, P&P loaf, scrapple souse, head cheese, pizza loaf, olive loaf, pate, deviled ham, sandwich spread, teawurst, cervelet, Lebanon bologna, potted meat food product, taco fillings, meat pie fillings.	55 g	n/a.
Linked meat sausage products, Vienna sausage, frankfurters, pork sausage, imitation frankfurters, bratwurst, kielbasa, Polish sausage, summer sausage, mettwurst, smoked country sausage, smoked sausage, smoked or pickled meat, pickled pigs feet.	55 g	n/a. 75 g=uncooked sausage.
Entrees without sauce, cuts of meat including marinated, tenderized, injected cuts of meat, beef patty, corn dog, bagel dog, croquettes, fritters, cured ham, dry cured ham, dry cured cappicola, corned beef, pastrami, country ham, pork shoulder picnic, meatballs, pureed adult foods.	85 g	106 g.
Canned meats, canned beef, canned pork. [4]	55 g	n/a.
Entrees with sauce, barbecued meats in sauce	140 g	n/a.
Mixed dishes NOT measurable with a cup; [5] e.g., burrito, egg roll, enchilada, pizza, pizza roll, quiche, all types of sandwiches, cracker and meat lunch type packages, gyro, stromboli, burger on a bun, frank on a bun, calzone, taco, pockets stuffed with meat, foldovers, meat lasagna, stuffed vegetables with meat, shish kabobs, empanada.	140 g (plus 55 g for products with sauce toppings)	n/a.
Mixed dishes measurable with a cup; e.g., meat casserole, macaroni and cheese with meat, pot pie, spaghetti with sauce, meat chili, chili with beans, meat hash, creamed chipped beef, beef ravioli in sauce, beef stroganoff, Brunswick stew, goulash, meat stew, ragout.	1 cup	n/a.
Salads—pasta or potato, potato salad with bacon, macaroni and meat salad	140 g	n/a.
Salads—all other meat, salads, ham salad	100 g	n/a.
Soups—all varieties	245 g	n/a.
Major main entree type sauce; e.g., spaghetti sauce with meat, spaghetti sauce with meatballs	125 g	n/a.
Minor main entree sauce; e.g., pizza sauce with meat, gravy	¼ cup	n/a.
Seasoning mixes dry, freeze dry, dehydrated, concentrated soup mixes, bases, extracts, dried broths and stock/juice, freeze dry trail mix products with meat.		
As reconstituted:		
Amount to make one Reference Amount of the final dish; e.g.,		
Gravy	¼ cup	n/a.
Major main entree type sauce	125 g	n/a.
Soup	245 g	n/a.
Entree measurable with a cup	1 cup	n/a.

[1] These values represent the amount of food customarily consumed per eating occasion and were primarily derived from the 1977–78 and the 1987–88 Nationwid3 Food Consumption Surveys conducted by the U.S. Department of Agriculture.

[2] Manufacturers are required to convert the Reference Amounts to the label serving size in a household measure most appropriate to their specific product using the procedures established by regulation.

[3] Examples listed under Product Category are not all inclusive or exclusive. Examples are provided to assist manufacturers in identifying appropriate product Reference Amount.

[4] If packed or canned in liquid, the Reference Amount is for the drained solids.

[5] Pizza sauce is part of the pizza and is not considered to be sauce topping.

(c) The Reference Amount for products that represent two or more foods packaged and presented to be consumed together (e.g., lunch meat, cheese, and crackers) shall be the sum of the Reference Amounts for individual foods in the package if the Reference Amount is not listed in paragraph (b) of this section and the product is not a meal-type product.

(d) The Administrator, on his or her own initiative or on behalf of any interested person who has submitted a labeling application, may issue a proposal to establish or amend a Product Category or Reference Amount identified in paragraph (b) of this section.

(1) Labeling applications and supporting documentation to be filed under this section shall be submitted in quadruplicate, except that the supporting documentation may be submitted on a computer disc copy. If any part of the material submitted is in a foreign language, it shall be accompanied by an accurate and complete English translation. The labeling application shall state the applicant's post office address.

(2) Pertinent information will be considered as part of an application on the basis of specific reference to such information submitted to and retained in the files of the Food Safety and Inspection Service. However, any reference to unpublished information furnished by a person other than the applicant will not be considered unless use of such information is authorized (with the understanding that such information may in whole or part be subject to release to the public) in a written statement signed by the person who submitted it. Any reference to published information should be accompanied by reprints or photostatic copies of such references.

(3) The availability for public disclosure of labeling applications, along with supporting documentation, submitted to the Agency under this section will be governed by the rules specified in subchapter D, title 9.

(4) Data accompanying the labeling application, such as food consumption data, shall be submitted on separate sheets, suitably identified. If such data has already been submitted with an earlier labeling application from the applicant, the present labeling application must provide the data.

(5) The labeling application must be signed by the applicant or by his or her attorney or agent, or (if a corporation) by an authorized official.

(6) The labeling application shall include a statement signed by the person responsible for the labeling application, that to the best of his or her knowledge, it is a representative and balanced submission that includes unfavorable information, as well as favorable information, known to him or her pertinent to the evaluation of the labeling application.

(7) Labeling applications for a new Reference Amount and/or Product Category shall be accompanied by the following data which shall be submitted in the following form to the Director, Food Labeling Division, Regulatory Programs, Food Safety and Inspection Service, Washington, DC 20250:

_____
(Date)

The undersigned, _____ submits this labeling application pursuant to 9 CFR 317.312 with respect to Reference Amount and/or Product Category.

Attached hereto, in quadruplicate, or on a computer disc copy, and constituting a part of this labeling application, are the following:

(i) A statement of the objective of the labeling application;

(ii) A description of the product;

(iii) A complete sample product label including nutrition label, using the format established by regulation;

(iv) A description of the form in which the product will be marketed;

(v) The intended dietary uses of the product with the major use identified (e.g., ham as a luncheon meat);

(vi) If the intended use is primarily as an ingredient in other foods, list of foods or food categories in which the product will be used as an ingredient with information on the prioritization of the use;

(vii) The population group for which the product will be offered for use (e.g., infants, children under 4 years of age);

(viii) The names of the most closely-related products (or in the case of foods for special dietary use and imitation or substitute foods, the names of the products for which they are offered as substitutes);

(ix) The suggested Reference Amount (the amount of edible portion of food as consumed, excluding bone, skin or other inedible components) for the population group for which the product is intended with full description of the methodology and procedures that were used to determine the suggested Reference Amount. In determining the Reference Amount, general principles and factors in paragraph (a) of this section should be followed.

(x) The suggested Reference Amount shall be expressed in metric units. Reference Amounts for foods shall be expressed in grams except when common household units such as cups, tablespoons, and teaspoons are more appropriate or are more likely to promote uniformity in serving sizes declared on product labels. For example, common household measures would be more appropriate if products within the same category differ substantially in density such as mixed dishes measurable with a cup.

(A) In expressing the Reference Amount in grams, the following general rules shall be followed:

(*1*) For quantities greater than 10 grams, the quantity shall be expressed in nearest 5 grams increment.

(*2*) For quantities less than 10 grams, exact gram weights shall be used.

(B) [Reserved]

(xi) A labeling application for a new subcategory of food with its own Reference Amount shall include the following additional information:

(A) Data that demonstrate that the new subcategory of food will be consumed in amounts that differ enough from the Reference Amount for the parent category to warrant a separate Reference Amount. Data must include sample size, and the mean, standard deviation, median, and modal consumed amount per eating occasion for the product identified in the labeling application and for other products in the category. All data must be derived from the same survey data.

(B) Documentation supporting the difference in dietary usage and product characteristics that affect the consumption size that distinguishes the product identified in the labeling application from the rest of the products in the category.

(xii) In conducting research to collect or process food consumption data in support of the labeling application, the following general guidelines should be followed.

(A) Sampled population selected should be representative of the demographic and socioeconomic characteristics of the target population group for which the food is intended.

(B) Sample size (i.e., number of eaters) should be large enough to give reliable estimates for customarily consumed amounts.

(C) The study protocol should identify potential biases and describe how potential biases are controlled for or, if not possible to control, how they affect interpretation of results.

(D) The methodology used to collect or process data including study design, sampling procedures, materials used (e.g., questionnaire, interviewer's manual), procedures used to collect or process data, methods or procedures used to control for unbiased estimates, and procedures used to correct for nonresponse, should be fully documented.

(xiii) A statement concerning the feasibility of convening associations, corporations, consumers, and other interested parties to engage in negotiated rulemaking to develop a proposed rule.

Yours very truly,

Applicant _____

By _____

(Indicate authority)

(8) Upon receipt of the labeling application and supporting documentation, the applicant shall be notified, in writing, of the date on which the labeling application was received. Such notice shall inform the applicant that the labeling application is undergoing Agency review and that the applicant shall subsequently be notified of the Agency's decision to consider for further review or deny the labeling application.

(9) Upon review of the labeling application and supporting documentation, the Agency shall notify the applicant, in writing, that the labeling application is either being considered for further review or that it has been summarily denied by the Administrator.

(10) If the labeling application is summarily denied by the Administrator, the written notification shall state the reasons therefor, including why the Agency has determined that the proposed Reference Amount and/or Product Category is false or misleading.

The notification letter shall inform the applicant that the applicant may submit a written statement by way of answer to the notification, and that the applicant shall have the right to request a hearing with respect to the merits or validity of the Administrator's decision to deny the use of the proposed Reference Amount and/or Product Category.

(i) If the applicant fails to accept the determination of the Administrator and files an answer and requests a hearing, and the Administrator, after review of the answer, determines the initial determination to be correct, the Administrator shall file with the Hearing Clerk of the Department the notification, answer, and the request for a hearing, which shall constitute the complaint and answer in the proceeding, which shall thereafter be conducted in accordance with the Department's Uniform Rules of Practice.

(ii) The hearing shall be conducted before an administrative law judge with the opportunity for appeal to the Department's Judicial Officer, who shall make the final determination for the Secretary. Any such determination by the Secretary shall be conclusive unless, within 30 days after receipt of notice of such final determination, the applicant appeals to the United States Court of Appeals for the circuit in which the applicant has its principal place of business or to the United States Court of Appeals for the District of Columbia Circuit.

(11) If the labeling application is not summarily denied by the Administrator, the Administrator shall publish in the Federal Register a proposed rule to amend the regulations to authorize the use of the Reference Amount and/or Product Category. The proposal shall also summarize the labeling application, including where the supporting documentation can be reviewed. The Administrator's proposed rule shall seek comment from consumers, the industry, consumer and industry groups, and other interested persons on the labeling application and the use of the proposed Reference Amount and/or Product Category. After public comment has been received and reviewed by the Agency, the Administrator shall make a determination on whether the proposed Reference Amount and/or Product Category shall be approved for use on the labeling of meat food products.

(i) If the Reference Amount and/or Product Category is denied by the Administrator, the Agency shall notify the applicant, in writing, of the basis for the denial, including the reason why the Reference Amount and/or Product Category on the labeling was determined by the Agency to be false or misleading. The notification letter shall also inform the applicant that the applicant may submit a written statement by way of answer to the notification, and that the applicant shall have the right to request a hearing with respect to the merits or validity of the Administrator's decision to deny the use of the proposed Reference Amount and/or Product Category.

(A) If the applicant fails to accept the determination of the Administrator and files an answer and requests a hearing, and the Administrator, after review of an answer, determines the initial determination to be correct, the Administrator shall file with the Hearing Clerk of the Department the notification, answer, and the request for a hearing, which shall constitute the complaint and answer in the proceeding, which shall thereafter be conducted in accordance with the Department's Uniform Rules of Practice.

(B) The hearing shall be conducted before an administrative law judge with the opportunity for appeal to the Department's Judicial Officer, who shall make the final determination for the Secretary. Any such determination by the Secretary shall be conclusive unless, within 30 days after receipt of the notice of such final determination, the applicant appeals to the United States Court of Appeals for the circuit in which the applicant has its principal place of business or to the United States Court of Appeals for the District of Columbia Circuit.

(ii) If the Reference Amount and/or Product Category is approved, the Agency shall notify the applicant, in writing, and shall also publish in the **Federal Register** a final rule amending the regulations to authorize the use of the Reference Amount and/or Product Category.

§ 317.313 Nutrient content claims; general principles.

(a) This section applies to meat products that are intended for human consumption and that are offered for sale, except that nutrient content claims may not be made on products intended specifically for use by infants and toddlers less than 2 years of age.

(b) A claim which, expressly or by implication, characterizes the level of a nutrient (nutrient content claim) of the type required in nutrition labeling pursuant to § 317.309, may not be made on a label or in labeling of that product unless the claim is made in accordance with 21 CFR 101.13 (b) through (f).

(c) through (h) [Reserved]

(i) The labeling of a product may contain a statement about the amount or percentage of a nutrient in accordance with 21 CFR 101.13(i) (1) through (3).

(j) Products may bear a statement that compares the level of a nutrient in the product with the level of a nutrient in a reference food in accordance with 21 CFR 101.13(j), except comparison to product of another manufacturer at 21 CFR 101.13(j)(1)(ii)(B).

(k) The term "modified" may be used in the statement of identity of a product in accordance with 21 CFR 101.13(k).

(l) For purposes of making a claim, a "meal-type product" shall be defined as a product that:

(1) Makes a significant contribution to the diet by weighing at least 6 ounces, but no more than 12 ounces per serving (container), and

(2) Contains ingredients from two or more of the following four food groups:

(i) Bread, cereal, rice and pasta group,

(ii) Fruits and vegetables group,

(iii) Milk, yogurt, and cheese group, and

(iv) Meat, poultry, fish, dry beans, eggs, and nuts group, and

(3) Is represented as, or is in a form commonly understood to be a breakfast, lunch, dinner, meal, main dish, entree, or pizza. Such representations may be made either by statements, photographs, or vignettes.

(m) [Reserved]

(n) Nutrition labeling in accordance with § 317.309, shall be provided for any food for which a nutrient content claim is made.

(o) Compliance with requirements for nutrient content claims shall be in accordance with § 317.309(h).

(p) The Reference Amount shall be used to determine whether a product meets the criteria for a nutrient content claim as discussed in 21 CFR 101.13(p)(1).

(q) The following exemptions apply:

(1) Nutrient content claims that have not been defined by regulation and that appear as part of a brand name that was in use prior to November 27, 1991, may continue to be used as part of that brand name, provided they are not false or misleading under section 1(n) of the Act (21 U.S.C. 601(n)(1)).

(2) [Reserved]

(3) A statement that describes the percentage of a vitamin or mineral in the food in relation to a reference daily intake (RDI) as defined in 21 CFR 101.9(c) may be made on the label.

(4) The requirements of this section do not apply to products for special dietary use as described in § 317.2(j)(2).

(5) [Reserved]

(6) Nutrient content claims that were part of the name of a product that was subject to a standard of identity as of November 27, 1991, are not subject to

the requirements of paragraph (b) of this section whether or not they meet the definition of the descriptive term.

(7) Implied nutrient content claims may be used as part of a brand name, provided that the use of the claim has been authorized by FSIS. Labeling applications requesting approval of such a claim may be submitted pursuant to § 317.369.

§§ 317.314–317.342 [Reserved]

§ 317.343 Significant participation for voluntary nutrition labeling.

(a) In evaluating significant participation for voluntary nutrition labeling, FSIS will consider only the major cuts of single-ingredient, raw meat products, as identified in § 317.344, including those that have been previously frozen.

(b) FSIS will judge a food retailer to be participating at a significant level if the retailer provides nutrition labeling information for at least 90 percent of the major cuts of single-ingredient, raw meat products, listed in § 317.344, that it sells, and if the nutrition label is consistent in content and format with the mandatory program, or nutrition information is displayed at point-of-purchase in an approriate manner.

(c) To determine whether there is significant participation by retailers under the voluntary nutrition labeling guidelines, FSIS will select a representative sample of companies allocated by type and size.

(d) FSIS will find that significant participation by food retailers exists if at least 60 percent of all companies that are evaluated are participating in accordance with the guidelines.

(e) FSIS will evaluate significant participation of the voluntary program every 2 years beginning in May 1995.

(1) If significant participation is found, the voluntary nutrition labeling guidelines shall remain in effect.

(2) If significant participation is not found, FSIS shall initiate rulemaking to require nutrition labeling on those products under the voluntary program.

§ 317.344 Identification of major cuts of meat products.

The major cuts of single-ingredient, raw meat products are: Beef chuck blade roast, beef loin top loin steak, beef rib roast large end, beef round eye round steak, beef round top round steak, beef round tip roast, beef chuck arm pot roast, beef loin sirloin steak, beef round bottom round steak, beef brisket (whole, flat half, or point half), beef rib steak small end, beef loin tenderloin steak, ground beef regular without added seasonings, ground beef extra lean without added seasoning, pork loin chop, pork loin country style ribs, pork loin top loin chop boneless, pork loin rib chop, pork spareribs, pork loin tenderloin, pork loin sirloin roast, pork shoulder blade steak, pork loin top roast boneless, ground pork, lamb shank, lamb shoulder arm chop, lamb shoulder blade chop, lamb rib roast, lamb loin chop, lamb leg (whole, sirloin half, or shank half), veal shoulder arm steak, veal shoulder blade steak, veal rib roast, veal loin chop, and veal cutlets.

§ 317.345 Guidelines for voluntary nutrition labeling of single-ingredient, raw products.

(a) Nutrition information on the cuts of single-ingredient, raw meat products, including those that have been previously frozen, shall be provided in the following manner:

(1) If a retailer chooses to provide nutrition information on the label of these products, these products shall be subject to all requirements of the mandatory nutrition labeling program, except that nutrition labeling may be declared on the basis of either "as consumed" or "as packaged." In addition, the declaration of the number of servings per container need not be included in nutrition labeling of single-ingredient, raw meat products (including ground beef), including those that have been previously frozen.

(2) If a retailer chooses to provide nutrition information at the point-of-purchase, such as by posting a sign, or by making the information readily available in brochures, notebooks, or leaflet form in close proximity to the food. If a nutrition claim is made on point-of-purchase materials all of the requirements of the mandatory nutrition labeling program apply. However, if only nutrition information—and not a nutrition claim—is supplied on point-of-purchase materials:

(i) The requirements of the mandatory nutrition labeling program apply, but the nutrition information may be supplied on an "as packaged" or "as consumed," basis;

(ii) The listing of DRV's may be voluntary; and

(iii) The point-of-purchase materials are not subject to any of the format requirements. The nutrition labeling information may also be supplemented by a video, live demonstration, or other media.

(b) [Reserved]

(c) The declaration of nutrition information may be presented in a simplified format as specified in § 317.309(g) for the mandatory nutrition labeling program.

(d) The nutrition label data should be based on either the raw or cooked edible portions of meat cuts with external cover fat at trim levels reflecting current marketing practices. If data are based on cooked portions, the methods used to cook the products must be specified and should be those which do not add nutrients from other ingredients such as flour, breading, and salt. Additional nutritional data may be presented on an optional basis for the raw or cooked edible portions of the separable lean of meat cuts.

(e) Nutrient data that are the most current representative data base values contained in USDA's National Nutrient Data Bank or its published form, the Agriculture Handbook No. 8 series, may be used for nutrition labeling of single-ingredient, raw meat products (including ground beef), including those that have been previously frozen. These data may be composite data that reflect different quality grades of beef or other variables affecting nutrient content. Alternatively, data that reflect specific grades or other variables may be used, except that if data are used on labels attached to a product which is labeled as to grade of meat or other variables, the data must represent the product in the package when such data are contained in the representative data base. When data are used on labels attached to a product, the data must represent the edible meat tissues present in the package.

(f) If the nutrition information is in accordance with paragraph (e) of this section, a nutrition label or labeling will not be subject to the Agency compliance review under § 317.309(h), unless a nutrition claim is made on the basis of the representative data base values.

(g) Retailers may use data bases that they believe reflect the nutrient content of single-ingredient, raw meat products (including ground beef), including those that have been previously frozen; however, such labeling shall be subject to the compliance procedures of paragraph (e) of this section and the requirements specified in this subpart for the mandatory nutrition labeling program.

§ 317.346–317.353 [Reserved]

§ 317.354 Nutrient content claims for "good source" and "high".

Nutrient content claims about a nutrient in a product in relation to the Reference Daily Intake (RDI) established for that nutrient in 21 CFR 101.9(c)(11)(iv) or Daily Reference Value (DRV) established for that nutrient in 21 CFR 101.9(c)(12)(i), excluding total carbohydrate and unsaturated fatty acids, may be used on the label or in

labeling, in accordance with 21 CFR 101.54 (a) through (d).

§ 317.355 [Reserved]

§ 317.356 Nutrient content claims for "light" or "lite".

(a) *General requirements.* The following nutrient content claims using the term "light" or "lite" to describe a product may be used on the label and in labeling, provided that the product is labeled in compliance with 21 CFR 101.56.

(b) The terms "light" or "lite" may be used in the brand name of foods to describe the sodium content, provided that:

(1) The product meets the sodium criteria provided in paragraph (a) of this section, and

(2) A statement specifically stating that the product is "light in sodium" or "lite in sodium" appears:

(i) Contiguous to the brand name;

(ii) In uniform type size, style, color, and prominence as the product name; and

(iii) The "light in sodium" or "lite in sodium" statement complies with paragraph (a) of this section.

§§ 317.357–317.359 [Reserved]

§ 317.360 Nutrient content claims for calorie content.

Nutrient content claims about the calorie content of a product may be used on the label or in labeling in accordance with 21 CFR 101.60(a) through (c).

§ 317.361 Nutrient content claims for sodium content.

Nutrient content claims about the sodium content of a product may be used on the label and in labeling in accordance with 21 CFR 101.61 (a) and (b).

§ 317.362 Nutrient content claims for fat, fatty acids, and cholesterol content of meat products.

(a) A claim about the level of fat, fatty acid, and cholesterol in a meat product may only be made on the label and in the labeling of the product in accordance with 21 CFR 101.62 (a) through (d), except, 21 CFR 101.62(c), (d)(1)(i), (d)(1)(ii) (A) through (D), (d)(2)(i), (d)(2)(ii) (A) through (D), (d)(4)(i), (d)(4)(ii) (A) through (D), (d)(5)(i), and (d)(5)(ii) (A) through (D).

(b) The terms "low in cholesterol" or "low cholesterol" may be used on the label or in labeling of a meal-type product as defined in § 317.313, provided that the product meets the requirements of 21 CFR 101.62(d)(2), except that requirements of 21 CFR 101.62(d)(2) (i)(A) and (ii)(A) shall be limited to 20 milligrams of cholesterol per 100 grams, and the requirements of 21 CFR 101.62(d)(2) (i)(B) and (ii)(B) shall be modified to require that the product contain 2 grams or less of saturated fat per 100 grams.

(c) *"Lean" and "Extra Lean" Claims.* The following nutrient content claims may be used on the label or in labeling, provided that the product is labeled in accordance with § 317.309, and the nutrient content claim complies with § 317.313:

(1) The term "lean" may be used on the label or in labeling of a meat product, provided that the product contains less than 10 grams fat, less than 4 grams saturated fat, and less than 95 milligrams cholesterol per 100 grams and Reference Amount Customarily Consumed (RACC) for individual foods, and per 100 grams and labeled serving size for meal-type products.

(2) The term "extra lean" may be used on the label or in labeling of a meat product, provided that the product contains less than 5 grams fat, less than 2 grams saturated fat, and less than 95 milligrams cholesterol per 100 grams and Reference Amount Customarily Consumed (RACC) for individual foods, and per 100 grams and per labeled serving size for meal-type products.

§§ 317.363–317.368 [Reserved]

§ 317.369 Labeling applications for nutrient content claims.

(a) This section pertains to labeling applications for claims, express or implied, that characterize the level of any nutrient required to be on the label or in labeling of product by this subpart.

(b) Labeling applications included in this section are:

(1) Labeling applications for a new (heretofore unauthorized) nutrient content claim,

(2) Labeling applications for a synonymous term (i.e., one that is consistent with a term defined by regulation) for characterizing the level of a nutrient, and

(3) Labeling applications for the use of an implied claim in a brand name.

(c) Labeling applications and supporting documentation to be filed under this section shall be submitted in quadruplicate, except that the supporting documentation may be submitted on a computer disc copy. If any part of the material submitted is in a foreign language, it shall be accompanied by an accurate and complete English translation. The labeling application shall state the applicant's post office address.

(d) Pertinent information will be considered as part of an application on the basis of specific reference to such information submitted to and retained in the files of the Food Safety and Inspection Service. However, any reference to unpublished information furnished by a person other than the applicant will not be considered unless use of such information is authorized (with the understanding that such information may in whole or part be subject to release to the public) in a written statement signed by the person who submitted it. Any reference to published information should be accompanied by reprints or photostatic copies of such references.

(e) If nonclinical laboratory studies accompany a labeling application, the applicant shall include, with respect to each nonclinical study included with the application, either a statement that the study has been, or will be, conducted in compliance with the good laboratory practice regulations as set forth in part 58 of chapter 1, title 21, or, if any such study was not conducted in compliance with such regulations, a brief statement of the reason for the noncompliance.

(f) If clinical investigations accompany a labeling application, the applicant shall include, with respect to each clinical investigation included with the application, either a statement that the investigation was conducted in compliance with the requirements for institutional review set forth in part 56 of chapter 1, title 21, or was not subject to such requirements in accordance with § 56.194 or § 56.105, and that it was conducted in compliance with the requirements for informed consents set forth in part 50 of chapter 1, title 21.

(g) The availability for public disclosure of labeling applications, along with supporting documentation, submitted to the Agency under this section will be governed by the rules specified in subchapter D, title 9.

(h) The data specified under this section to accompany a labeling application shall be submitted on separate sheets, suitably identified. If such data has already been submitted with an earlier labeling application from the applicant, the present labeling application must provide the data.

(i) The labeling application must be signed by the applicant or by his or her attorney or agent, or (if a corporation) by an authorized official.

(j) The labeling application shall include a statement signed by the person responsible for the labeling application, that to the best of his or her knowledge, it is a representative and balanced submission that includes unfavorable information, as well as favorable information, known to him or

her pertinent to the evaluation of the labeling application.

(k)(1) Labeling applications for a new nutrient content claim shall be accompanied by the following data which shall be submitted in the following form to the Director, Food Labeling Division, Regulatory Programs, Food Safety and Inspection Service, Washington, DC 20250.

(Date)

The undersigned, _____, submits this labeling application pursuant to 9 CFR 317.369 with respect to (statement of the claim and its proposed use).

Attached hereto, in quadruplicate, or on a computer disc copy, and constituting a part of this labeling application, are the following:

(i) A statement identifying the nutrient content claim and the nutrient that the term is intended to characterize with respect to the level of such nutrient. The statement shall address why the use of the term as proposed will not be misleading. The statement shall provide examples of the nutrient content claim as it will be used on labels or labeling, as well as the types of products on which the claim will be used. The statement shall also specify the level at which the nutrient must be present or what other conditions concerning the product must be met for the appropriate use of the term in labels or labeling, as well as any factors that would make the use of the term inappropriate.

(ii) A detailed explanation supported by any necessary data of why use of the food component characterized by the claim is of importance in human nutrition by virtue of its presence or absence at the levels that such claim would describe. This explanation shall also state what nutritional benefit to the public will derive from use of the claim as proposed and why such benefit is not available through the use of existing terms defined by regulation. If the claim is intended for a specific group within the population, the analysis shall specifically address nutritional needs of such group, and scientific data sufficient for such purpose, and data and information to the extent necessary to demonstrate that consumers can be expected to understand the meaning of the term under the proposed conditions of use.

(iii) Analytical data that demonstrates the amount of the nutrient that is present in the products for which the claim is intended. The assays should be performed on representative samples in accordance with 317.309(h). If no USDA or AOAC methods are available, the applicant shall submit the assay method used, and data establishing the validity of the method for assaying the nutrient in the particular food. The validation data shall include a statistical analysis of the analytical and product variability.

(iv) A detailed analysis of the potential effect of the use of the proposed claim on food consumption, and any corresponding changes in nutrient intake. The analysis shall specifically address the intake of nutrients that have beneficial and negative consequences in the total diet. If the claim is intended for a specific group within the population, the analysis shall specifically address the dietary practices of such group, and shall include data sufficient to demonstrate that the dietary analysis is representative of such group.

Yours very truly,

Applicant _____

By _____

(Indicate authority)

(2) Upon receipt of the labeling application and supporting documentation, the applicant shall be notified, in writing, of the date on which the labeling application was received. Such notice shall inform the applicant that the labeling application is undergoing Agency review and that the applicant shall subsequently be notified of the Agency's decision to consider for further review or deny the labeling application.

(3) Upon review of the labeling application and supporting documentation, the Agency shall notify the applicant, in writing, that the labeling application is either being considered for further review or that it has been summarily denied by the Administrator.

(4) If the labeling application is summarily denied by the Administrator, the written notification shall state the reasons therefor, including why the Agency has determined that the proposed nutrient content claim is false or misleading. The notification letter shall inform the applicant that the applicant may submit a written statement by way of answer to the notification, and that the applicant shall have the right to request a hearing with respect to the merits or validity of the Administrator's decision to deny the use of the proposed nutrient content claim.

(i) If the applicant fails to accept the determination of the Administrator and files an answer and requests a hearing, and the Administrator, after review of the answer, determines the initial determination to be correct, the Administrator shall file with the Hearing Clerk of the Department the notification, answer, and the request for a hearing, which shall constitute the complaint and answer in the proceeding, which shall thereafter be conducted in accordance with the Department's Uniform Rules of Practice.

(ii) The hearing shall be conducted before an administrative law judge with the opportunity for appeal to the Department's Judicial Officer, who shall make the final determination for the Secretary. Any such determination by the Secretary shall be conclusive unless, within 30 days after receipt of notice of such final determination, the applicant appeals to the United States Court of Appeals for the circuit in which the applicant has its principal place of business or to the United States Court of Appeals for the District of Columbia Circuit.

(5) If the labeling application is not summarily denied by the Administrator, the Administrator shall publish in the **Federal Register** a proposed rule to amend the regulations to authorize the use of the nutrient content claim. The proposal shall also summarize the labeling application, including where the supporting documentation can be reviewed. The Administrator's proposed rule shall seek comment from consumers, the industry, consumer and industry groups, and other interested persons on the labeling application and the use of the proposed nutrient content claim. After public comment has been received and reviewed by the Agency, the Administrator shall make a determination on whether the proposed nutrient content claim shall be approved for use on the labeling of meat and food products.

(i) If the claim is denied by the Administrator, the Agency shall notify the applicant, in writing, of the basis for the denial, including the reason why the claim on the labeling was determined by the Agency to be false or misleading. The notification letter shall also inform the applicant that the applicant may submit a written statement by way of answer to the notification, and that the applicant shall have the right to request a hearing with respect to the merits or validity of the Administrator's decision to deny the use of the proposed nutrient content claim.

(A) If the applicant fails to accept the determination of the Administrator and files an answer and requests a hearing, and the Administrator, after review of the answer, determines the initial determination to be correct, the Administrator shall file with the Hearing Clerk of the Department the notification, answer, and the request for a hearing, which shall constitute the complaint and answer in the preceding, which shall thereafter be conducted in accordance with the Department's Uniform Rules of Practice.

(B) The hearing shall be conducted before an administrative law judge with the opportunity for appeal to the Department's Judicial Officer, who shall make final determination for the Secretary. Any such determination by the Secretary shall be conclusive unless, within 30 days after receipt of the notice of such final determination, the application appeals to the United States Court of Appeals for the circuit in which the applicant has its principal place of business or to the United States

Court of Appeals for the District of Columbia Circuit.

(ii) If the claim is approved, the Agency shall notify the applicant, in writing, and shall also publish in the Federal Register a final rule amending the regulations to authorize the use of the claim.

(l) (1) Labeling applications for a synonymous term shall be accompanied by the following data which shall be submitted in the following form to the Director, Food Labeling Division, Regulatory Programs, Food Safety and Inspection Service, Washington, DC 20250:

(Date)

The undersigned, _____ submits this labeling application pursuant to 9 CFR 317.369 with respect to (statement of the synonymous term and its proposed use in a nutrient content claim that is consistent with an existing term that has been defined under subpart B of part 317).

Attached hereto, in quadruplicate, or on a computer disc copy, and constituting a part of this labeling application, are the following:

(i) A statement identifying the synonymous term, the existing term defined by a regulation with which the synonymous term is claimed to be consistent, and the nutrient that the term is intended to characterize the level of. The statement shall address why the use of the synonymous term as proposed will not be misleading. The statement shall provide examples of the nutrient content claim as it will be used on labels or labeling, as well as the types of products on which the claim will be used. The statement shall also specify whether any limitations not applicable to the use of the defined term are intended to apply to the use of the synonymous term.

(ii) A detailed explanation supported by any necessary data of why use of the proposed term is requested, including whether the existing defined term is inadequate for the purpose of effectively characterizing the level of a nutrient. This explanation shall also state what nutritional benefit to the public will derive from use of the claim as proposed, and why such benefit is not available through the use of existing terms defined by regulation. If the claim is intended for a specific group within the population, the analysis shall specifically address nutritional needs of such group, scientific data sufficient for such purpose, and data and information to the extent necessary to demonstrate that consumers can be expected to understand the meaning of the term under the proposed conditions of use.

Yours very truly,

Applicant _____

(Indicate authority)

(2) Upon receipt of the labeling application and supporting documentation, the applicant shall be notified, in writing, of the date on which the labeling application was received. Such notice shall inform the applicant that the labeling application is undergoing Agency review and that the applicant shall subsequently be notified of the Agency's decision to consider for further review or deny the labeling application.

(3) Upon review of the labeling application and supporting documentation, the Agency shall notify the applicant, in writing, that the labeling application is either being considered for further review or that it has been summarily denied by the Administrator.

(4) If the labeling application is summarily denied by the Administrator, the written notification shall state the reasons therefor, including why the Agency has determined that the proposed synonymous term is false or misleading. The notification letter shall inform the applicant that the applicant may submit a written statement by way of answer to the notification, and that the applicant shall have the right to request a hearing with respect to the merits or validity of the Administrator's decision to deny the use of the proposed synonymous term.

(i) If the applicant fails to accept the determination of the Administrator and files an answer and requests a hearing, and the Administrator, after review of the answer, determines the initial determination to be correct, the Administrator shall file with the Hearing Clerk of the Department the notification, answer, and the request for a hearing, which shall constitute the complaint and answer in the proceeding, which shall thereafter be conducted in accordance with the Department's Uniform Rules of Practice.

(ii) The hearing shall be conducted before an administrative law judge with the opportunity for appeal to the Department's Judicial Officer, who shall make the final determination for the Secretary. Any such determination by the Secretary shall be conclusive unless, within 30 days after receipt of notice of such final determination, the applicant appeals to the United States Court of Appeals for the circuit in which the applicant has its principal place of business or to the United States Court of Appeals for the District of Columbia Circuit.

(5) If the claim is approved, the Agency shall notify the applicant, in writing, and shall publish in the Federal Register a notice informing the public that the synonymous term has been approved for use.

(m) (1) Labeling applications for the use of an implied nutrient content claim in a brand name shall be accompanied by the following data which shall be submitted in the following form to the Director, Food Labeling Division, Regulatory Programs, Food Safety and Inspection Service, Washington, DC 20250:

(Date)

The undersigned, _____ submits this labeling application pursuant to 9 CFR 317.369 with respect to (statement of the implied nutrient content claim and its proposed use in a brand name).

Attached hereto, in quadruplicate, or on a computer disc copy, and constituting a part of this labeling application, are the following:

(l) A statement identifying the implied nutrient content claim, the nutrient the claim is intended to characterize, the corresponding term for characterizing the level of such nutrient as defined by a regulation, and the brand name of which the implied claim is intended to be a part. The statement shall address why the use of the brand-name as proposed will not be misleading. The statement shall provide examples of the types of products on which the brand name will appear. It shall also include data showing that the actual level of the nutrient in the food would qualify the label of the product to bear the corresponding term defined by regulation. Assay methods used to determine the level of a nutrient shall meet the requirements stated under labeling application format in paragraph (k)(1)(iii) of this section.

(ii) A detailed explanation supported by any necessary data of why use of the proposed brand name is requested. This explanation shall also state what nutritional benefit to the public will derive from use of the brand name as proposed. If the branded product is intended for a specific group within the population, the analysis shall specifically address nutritional needs of such group and scientific data sufficient for such purpose.

Yours very truly,

Applicant _____

By _____

(2) Upon receipt of the labeling application and supporting documentation, the applicant shall be notified, in writing, of the date on which the labeling application was received. Such notice shall inform the applicant that the labeling application is undergoing Agency review and that the applicant shall subsequently be notified of the Agency's decision to consider for further review or deny the labeling application.

(3) Upon review of the labeling application and supporting documentation, the Agency shall notify the applicant, in writing, that the labeling application is either being considered for further review or that it has been summarily denied by the Administrator.

(4) If the labeling application is summarily denied by the Administrator, the written notification shall state the

reasons therefor, including why the Agency has determined that the proposed implied nutrient content claim is false or misleading. The notification letter shall inform the applicant that the applicant may submit a written statement by way of answer to the notification, and that the applicant shall have the right to request a hearing with respect to the merits or validity of the Administrator's decision to deny the use of the proposed implied nutrient content claim.

(i) If the applicant fails to accept the determination of the Administrator and files an answer and requests a hearing, and the Administrator, after review of the answer, determines the initial determination to be correct, the Administrator shall file with the Hearing Clerk of the Department the notification, answer, and the request for a hearing, which shall constitute the complaint and answer in the proceeding, which shall thereafter be conducted in accordance with the Department's Uniform Rules of Practice.

(ii) The hearing shall be conducted before an administrative law judge with the opportunity for appeal to the Department's Judicial Officer, who shall make the final determination for the Secretary. Any such determination by the Secretary shall be conclusive unless, within 30 days after receipt of notice of such final determination, the applicant appeals to the United States Court of Appeals for the circuit in which the applicant has its principal place of business or to the United States Court of Appeals for the District of Columbia Circuit.

(5) If the labeling application is not summarily denied by the Administrator, the Administrator shall publish a notice of the labeling application in the Federal Register seeking comment on the use of the implied nutrient content claim. The notice shall also summarize the labeling application, including where the supporting documentation can be reviewed. The Administrator's notice shall seek comment from consumers, the industry, consumer and industry groups, and other interested persons on the labeling application and the use of the implied nutrient content claim. After public comment has been received and reviewed by the Agency, the Administrator shall make a determination on whether the implied nutrient content claim shall be approved for use on the labeling of meat food products.

(i) If the claim is denied by the Administrator, the Agency shall notify the applicant, in writing, of the basis for the denial, including the reason why the claim on the labeling was determined by the Agency to be false or misleading. The notification letter shall also inform the applicant that the applicant may submit a written statement by way of answer to the notification, and that the applicant shall have the right to request a hearing with respect to the merits or validity of the Administrator's decision to deny the use of the proposed implied nutrient content claim.

(A) If the applicant fails to accept the determination of the Administrator and files an answer and requests a hearing, and the Administrator, after review of the answer, determines the initial determination to be correct, the Administrator shall file with the Hearing Clerk of the Department the notification, answer, and the request for a hearing, which shall thereafter be conducted in accordance with the Department's Uniform Rules of Practice.

(B) The hearing shall be conducted before an administrative law judge with the opportunity for appeal to the Department's Judicial Officer, who shall make the final determination for the Secretary. Any such determination by the Secretary shall be conclusive unless, within 30 days after receipt of the notice of such final determination, the applicant appeals to the United States Court of Appeals for the circuit in which the applicant has its principal place of business or to the United States Court of Appeals for the District of Columbia Circuit.

(ii) If the claim is approved, the Agency shall notify the applicant, in writing, and shall also publish in the Federal Register a notice informing the public that the implied nutrient content claim has been approved for use.

§§ 317.370–317.379 [Reserved]

§ 317.380 Label statements relating to usefulness in reducing or maintaining body weight.

(a) *General requirements.* Any product that purports to be or is represented for special dietary use because of usefulness in reducing body weight shall bear:

(1) Nutrition labeling in conformity with § 317.309 of this subpart, unless exempt under that section, and

(2) A conspicuous statement of the basis upon which the product claims to be of special dietary usefulness.

(b) *Nonnutritive ingredients.* (1) Any product subject to paragraph (a) of this section that achieves its special dietary usefulness by use of a nonnutritive ingredient (i.e., one not utilized in normal metabolism) shall bear on its label a statement that it contains a nonnutritive ingredient and the percentage by weight of the nonnutritive ingredient.

(2) A special dietary product may contain a nonnutritive sweetener or other ingredient only if the ingredient is safe for use in the product under the applicable law and regulations of this chapter. Any product that achieves its special dietary usefulness in reducing or maintaining body weight through the use of a nonnutritive sweetener shall bear on its label the statement required by paragraph (b)(1) of this section, but need not state the percentage by weight of the nonnutritive sweetener. If a nutritive sweetener(s) as well as nonnutritive sweetener(s) is added, the statement shall indicate the presence of both types of sweetener; e.g., "Sweetened with nutritive sweetener(s) and nonnutritive sweetener(s)."

(c) *"Low calorie" foods.* A product purporting to be "low calorie" must comply with the criteria set forth for such foods in § 317.360(b) (2) and (3).

(d) *"Reduced calorie" foods and other comparative claims.* A product purporting to be "reduced calorie" or otherwise containing fewer calories than a reference food must comply with the criteria set forth for such foods in § 317.360(b) (4) and (5).

§§ 317.381–317.399 [Reserved]

§ 317.400 Exemption from nutrition labeling.

(a) The following meat food products are exempt from nutrition labeling:

(1) Food products produced by small businesses provided that the labels for these products bear no nutrition claims or nutrition information,

(i) A food product, for the purposes of the small business exemption, is defined as a formulation, not including distinct flavors which do not significantly alter the nutritional profile, sold in any size package in commerce.

(ii) For purposes of this paragraph, a small business is any single-plant facility or multi-plant company/firm that employs 500 or fewer people and produces no more than the following amounts of pounds of the product qualifying the firm for exemption from this subpart:

(A) During the first year of implementation of nutrition labeling, from July 1994 to July 1995, 250,000 pounds or less,

(B) During the second year of implementation of nutrition labeling, from July 1995 to July 1996, 175,000 pounds or less, and

(C) During the third year of implementation and subsequent years thereafter, 100,000 pounds or less.

(2) Products intended for further processing, provided that the labels for these products bear no nutrition claim or nutrition information,

(3) Products that are not for sale to consumers, provided that the labels for these products bear no nutrition claims or nutrition information,

(4) Products in small packages that are individually wrapped packages of less than ½ ounce net weight, provided that the labels for these products bear no nutrition claims or nutrition information,

(5) Products custom slaughtered or prepared,

(6) Products intended for export, and

(7) The following products prepared and served or sold at retail provided that the labels or the labeling of these products bear no nutrition claims or nutrition information:

(i) Ready-to-eat products that are packaged or portioned at a retail store or similar retail-type establishment; and

(ii) Multi-ingredient products (e.g., sausage) processed at a retail store or similar retail-type establishment.

(b) Restaurant menus generally do not constitute labeling or fall within the scope of these regulations.

(c) Foods represented to be specifically for infants and children less than 2 years of age shall bear nutrition labeling, except such labeling shall not include calories from fat, calories from saturated fat, saturated fat, polyunsaturated fat, monounsaturated fat, and cholesterol. Foods represented to be specifically for infants and children less than 4 years of age shall bear nutrition labeling, except that such labeling shall not include listings of percent of daily value and the daily value list. Nutrient names and quantitative amounts by weight shall be presented in two separate columns.

PART 320—RECORDS, REGISTRATION, AND REPORTS

3. The authority citation for part 320 continues to read follows:

Authority: 21 U.S.C. 601–695; 7 CFR 2.17, 2.55.

4. Section 320.1 is amended by adding a new paragraph (b)(8) to read as follows:

§ 320.1 Records required to be kept.

* * * * *

(b) * * *

(8) Records of nutrition labeling as required by subpart B, part 317, of this subchapter.

PART 381—POULTRY PRODUCTS INSPECTION REGULATIONS

5. The authority citation for part 381 continues to read as follows:

Authority: 7 U.S.C. 450, 21 U.S.C. 451–470, 7 CFR 2.17, 2.55.

6. Section 381.175 is amended by adding a new paragraph (b)(5) to read as follows:

§ 381.175 Records required to be kept.

* * * * *

(b) * * *

(5) Records of nutrition labeling as required by subpart Y of this part.

7. Part 381 is amended by adding a new subpart Y to read as follows:

Subpart Y—Nutrition Labeling

Sec.

Subpart Y—Nutrition Labeling

§ 381.400 Nutrition labeling of poultry products.

(a) Nutrition labeling shall be provided for all poultry products, except single-ingredient, raw products, in accordance with the requirements of § 381.409, except as exempted under § 381.500 of this subpart.

(b) Nutrition labeling may be provided for single-ingredient, raw poultry products in accordance with the requirements of §§ 381.409 and 381.445. Significant participation in voluntary nutrition labeling shall be measured by the Agency in accordance with §§ 381.443 and 381.444 of this subpart.

§ 381.401 [Reserved]

§ 381.402 Location of nutrition information.

(a) Nutrition information on a label of packaged poultry products shall appear on the label's principal display panel or on the information panel, except as provided in paragraph (b) of this section.

(b) Nutrition information for gift packs may be shown at a location other than on the product label, provided that the labels for these products bear no nutrition claim. In lieu of on the product label, nutrition information may be provided by alternate means such as product label inserts.

§§ 381.403–381.407 [Reserved]

§ 381.408 Labeling of poultry products with number of servings.

The label of any package of a poultry product that bears a representation as to the number of servings contained in such package shall meet the requirements of § 381.121(c)(7).

§ 381.409 Nutrition label content.

(a)(1) All nutrient and product component quantities shall be declared in relation to a serving or to a portion, as defined in 21 CFR 101.9(b) (1) and (2) except (b)(2)(i), and 21 CFR 101.9(b) (5) through (9) except (b)(5)(iii).

(2) The declaration of nutrient and product component content shall be on the basis of the product "as packaged" for all products, except that single-ingredient, raw products may be declared on the basis of the product "as consumed" as set forth in § 381.445(a)(1). In addition to the required declaration on the basis of "as packaged" for products other than single-ingredient, raw products, the declaration may also be made on the basis of "as consumed," provided that preparation and cooking instructions are clearly stated.

(3) For products in discrete units (e.g., chicken wings, chicken breasts, and individually packaged products within a multi-serving package), serving size shall be the number of whole units that most closely approximates the Reference Amount for the Product Category. If a unit weighs 67 percent or more, but less than 200 percent of the Reference Amount, serving size shall be one unit. If a unit weighs more than 50 percent but less than 67 percent of the Reference Amount, the manufacturer may decide whether one unit is one

serving. If a unit weighs 200 percent or more of the Reference Amount, the manufacturer may declare the whole unit as one serving if the whole unit can reasonably be consumed at a single-eating occasion.

(4) Serving size for meal-type products as defined in § 381.413(l) shall be the entire content (edible portion only) of the package.

(5) Another column of figures may be used to declare the nutrient and food component information, in the same format as required by § 381.408(e),

(i) Per 100 grams, 100 milliliters, or 1 ounce of the food as packaged or purchased.

(ii) Per one unit if the serving size of a product in discrete units in a multi-serving container is more than one unit.

(6) If cups, tablespoons and teaspoons, or units such as piece, slice, tray, jar, or fraction are not applicable, ounces may be used. Ounce measurements shall be expressed in 0.5 ounce increments most closely approximating the Reference Amount, with rounding indicated by use of the term "about" (e.g., about 2.5 ounces).

(b) The declaration of nutrition information on the label shall contain the following information, except for that which is identified as "VOLUNTARY" or for those poultry products where a simplified format may be used as provided for in paragraph (g) of this section or as in § 381.500(b). No nutrients or food components, other than those listed in 21 CFR 101.9(c) as either voluntary or mandatory, except for stearic acid, may be included within the nutrition label. Information shall be presented using the nutrient names specified and in the formats specified in paragraph (e) of this section. Definitions, units of measure, increments for declaring values, and methods of calculation shall be in accordance with 21 CFR 101.9 (c)(1) through (c)(9), except 21 CFR 101.9(c)(1)(i)(E), bomb calorimetry, and 21 CFR 101.9(c)(7)(ii) use of nitrogen conversion factors, other than 6.25.

(c)(1) If a product consists of assortments of poultry products (e.g., variety packs) in the same package, nutrient content shall be expressed on the entire package contents or on each individual product.

(2) If a product is commonly combined with other ingredients or is cooked or otherwise prepared before eating, and directions for such combination or preparations are provided, another column of figures may be used to declare the nutrient contents on the basis of the product as consumed for the product alone (e.g., a cream soup mix may be labeled with one set of Daily Values for the dry mix (per serving), and another set for the serving of the final soup when prepared (e.g., per serving of cream soup mix and 1 cup of vitamin D fortified whole milk)): *Provided,* that the type and quantity of the other ingredients to be added to the product by the user and the specific method of cooking and other preparation shall be specified prominently on the label.

(d) "Stearic acid" may be declared "VOLUNTARY." If stearic acid is declared "VOLUNTARY" a statement of the number of grams of stearic acid shall be included under saturated fat content and expressed to the nearest 0.5 (½) gram incremented below 3 grams and to the nearest gram increment above 3 grams.

(e) Formats for nutrition labeling shall be in accordance with 21 CFR 101.9 (d) and (e) except for references to (f), (j)(5), and (j)(13), or in accordance with paragraph (g)(1) of this section.

(f) Foods in packages that have a total surface area available to bear labeling of 40 or less square inches may modify the requirements of paragraphs (b), (e), and (g) of this section and 381.402(a) by one or more of the following means:

(1) Presenting the required nutrition information in a tabular or linear (i.e., string) fashion, rather than in vertical columns, if the package shape or size cannot accommodate a column display on any label panel. Nutrition information may be given in a linear fashion only if the label will not accommodate a *tabular display and, in that case, subcomponents (e.g., saturated fat shall be declared in parentheses after total fat).*

(2) Using any of the following abbreviations:

Serving size—Serv. size
Servings per container—Servings
Calories from fat—Fat cal
Saturated fat—Sat fat
Cholesterol—Cholest
Total carbohydrate—Total carb
Dietary fiber—Fiber

(3) Omitting the footnote and caloric conversion information required in paragraphs (d)(9) and (d)(10) of 21 CFR 101.9 and placing another asterisk at the bottom of the label followed by the statement "Percent Daily Values are based on a 2,000 calorie diet" and, if the term "Daily Value" is not spelled out in the heading, a statement that "DV" represents "Daily Value," and

(4) Presenting the required nutrition information on any other label panel.

(g)(1) Nutrition information may be presented in a simplified format as set forth herein when any required nutrients, other than the core nutrients, are present in insignificant amounts. An insignificant amount shall be defined as that amount that may be rounded to zero in nutrition labeling, except that for total carbohydrate, dietary fiber, and protein, it shall be an amount less than 1 gram.

(2) The simplified format shall include: Serving size, number of servings per container, calories, total fat (grams), total carbohydrate (grams), protein (grams), and sodium (milligrams).

(3) Any nutrient, other than a core nutrient, that is present in an insignificant amount may be omitted from the tabular listing, provided that the following statement is included within the nutrition label, "Not a significant source of _____." The blank shall be filled in with the appropriate nutrient or food component.

(4) The omission of the listing of daily values and the caloric conversion information, and the expression of the percent of daily value in the simplified format shall be in accordance with 21 CFR 101.9(f)(5), except for references to (j)(5) and (j)(13).

(h) Compliance with this section shall be determined as follows:

(1) A production lot is a set of food production consumer units that are from one production shift. Alternatively, a collection of consumer units of the same size, type, and style produced under conditions as nearly uniform as possible, designated by a common container code or marking, constitutes a production lot.

(2) The sample for nutrient analysis shall consist of a composite of a minimum of six consumer units, each from a production lot. Alternatively, the sample for nutrient analysis shall consist of a composite of a minimum of six consumer units, each randomly chosen to be representative of a production lot. In each case, the units may be individually analyzed and the results of the analyses averaged, or the units would be composited and the composite analyzed. In both cases, the results, whether an average or a single result from a composite, will be considered by the Agency to be the nutrient content of a composite. All analyses shall be performed by appropriate methods and procedures used by the Department for each nutrient in accordance with the "Chemistry Laboratory Guidebook," or, if no USDA method is available and appropriate for the nutrient, by appropriate methods for the nutrient in accordance with the 1990 edition of the "Official Methods of Analysis" of the AOAC International, formerly Association of Official Analytical

Chemists, 15th ed., which is incorporated by reference, unless a particular method of analysis is specified in § 381.409(b), or, if no USDA, AOAC, or specified method is available and appropriate, by other reliable and appropriate analytical procedures as so determined by the Agency. The "Official Methods of Analysis" is incorporated as it exists on the date of approval. This incorporation by reference was approved by the Director of the Federal Register in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. Copies may be purchased from the AOAC International, 2200 Wilson Blvd., Suite 400, Arlington, VA 22201. It is also available for inspection at the Office of the Federal Register Information Center, suite 700, 800 North Capitol Street, NW., Washington, DC.

(3) Two classes of nutrients are defined for purposes of compliance:

(i) Class I. Added nutrients in fortified or fabricated foods; and

(ii) Class II. Naturally occurring (indigenous) nutrients. If any ingredient which contains a naturally occurring (indigenous) nutrient is added to a food, the total amount of such nutrient in the final food product is subject to Class II requirements unless the same nutrient is also added, which would make the total amount of such nutrient subject to Class I requirements.

(4) A product with a label declaration of a vitamin, mineral, protein, total carbohydrate, dietary fiber, other carbohydrate, polyunsaturated or monounsaturated fat, or potassium shall be deemed to be misbranded under section 4(h) of the Poultry Products Inspection Act (21 U.S.C. 453(h)(4)) unless it meets the following requirements:

(i) Class I vitamin, mineral, protein, dietary fiber, or potassium. The nutrient content of the composite is at least equal to the value for that nutrient declared on the label.

(ii) Class II vitamin, mineral, protein, total carbohydrate, dietary fiber, other carbohydrate, polyunsaturated or monounsaturated fat, or potassium. The nutrient content of the composite is at least equal to 80 percent of the value for that nutrient declared on the label; *Provided*, That no regulatory action will be based on a determination of a nutrient value which falls below this level by an amount less than the variability generally recognized for the analytical method used in that product at the level involved, and inherent nutrient variation in a product.

(5) A product with a label declaration of calories, sugars, total fat, saturated fat, cholesterol, or sodium shall be deemed to be misbranded under section 4(h) of the Poultry Products Inspection Act (21 U.S.C. 453(h)(4)) if the nutrient content of the composite is greater than 20 percent in excess of the value for that nutrient declared on the label; *Provided*, That no regulatory action will be based on a determination of a nutrient value which falls below this level by an amount less than the variability generally recognized for the analytical method used in that product at the level involved, and inherent nutrient variation in a product.

(6) The amount of a vitamin, mineral, protein, total carbohydrate, dietary fiber, other carbohydrate, polyunsaturated or monounsaturated fat, or potassium may vary over labeled amounts within good manufacturing practice. The amount of calories, sugars, total fat, saturated fat, cholesterol, or sodium may vary under labeled amounts within good manufacturing practice.

(7) Compliance will be based on the metric measure specified in the label statement of serving size.

(8) The management of the establishment must maintain records to support the validity of nutrient declarations contained on product labels. Such records shall be made available to the inspector or any duly authorized representative of the Agency upon request.

(9) The compliance provisions set forth in paragraph (h)(1) through (8) of this section shall not apply to single-ingredient, raw poultry products, including those that have been previously frozen, when nutrition labeling is based on the most current representative data base values contained in USDA's National Nutrient Data Bank or its published form, the Agriculture Handbook No. 8 series.

§ 381.410 [Reserved]

§ 381.411 [Reserved]

§ 381.412 Reference amounts customarily consumed per eating occasion.

(a) The general principles followed in arriving at the Reference Amounts for serving (portion) sizes set forth in paragraph (b) of this section are found in 21 CFR 101.12(a), (c), (d) and (g).

(b) The following Product Categories and Reference Amounts shall be used as the basis for determining serving sizes for specific products:

TABLE 1.—REFERENCE AMOUNTS CUSTOMARILY CONSUMED PER EATING OCCASION—INFANT AND TODDLER FOODS [1,2,3]

Product category	Reference amount
Infant & Toddler Foods:	
Dinner Dry Mix	15 g
Dinner, ready-to-serve, strained type	60 g
Dinner, soups, ready-to-serve junior type	110 g
Dinner, stew or soup ready-to-serve toddlers	170 g

[1] These values represent the amount of food customarily consumed per eating occasion and were primarily derived from the 1977–1978 and the 1987–1988 Nationwide Food Consumption Surveys conducted by the U.S. Department of Agriculture.

[2] Unless otherwise noted in the Reference Amount column, the Reference Amounts are for the ready-to-serve or almost ready-to-serve form of the product (i.e., heat and serve). If not listed separately, the Reference Amount for the unprepared form (e.g., dehydrated cereal) is the amount required to make one Reference Amount of the prepared form.

[3] Manufacturers are required to convert the Reference Amount to the label serving size in a household measure most appropriate to their specific product using the procedures established by the regulation.

TABLE 2.—REFERENCE AMOUNTS CUSTOMARILY CONSUMED PER EATING OCCASION—GENERAL FOOD SUPPLY [1,2,3,4,5]

Product category	Reference	Reference
	Ready-to-serve	Ready-to-cook
Egg mixtures, (western style omelet, souffle, egg foo young with poultry)	110 g	n/a
Salad and potato toppers; e.g., poultry bacon bits	7 g	n/a
Bacon; e.g., poultry breakfast strips.	15 g	26 g = bacon. 18 g = breakfast strips
Dried; e.g., poultry jerky, dried poultry, poultry sausage products with a moisture/protein ratio of less than 2:1	30 g	n/a
Snacks; e.g., poultry snack food sticks	30 g	n/a
Luncheon products, poultry bologna, poultry Canadian style bacon, poultry crumbles, poultry luncheon loaf, potted poultry products, poultry taco fillings.	55 g	n/a
Linked poultry sausage products, poultry franks, poultry Polish sausage, smoked or pickled poultry meat, poultry smoked sausage.	55 g	n/a 69 g = uncooked sausage.

TABLE 2.—REFERENCE AMOUNTS CUSTOMARILY CONSUMED PER EATING OCCASION—GENERAL FOOD SUPPLY[1,2,3,4,5]—Continued

Product category	Reference Ready-to-serve	Reference Ready-to-cook
Entrees without sauce, poultry cuts, ready to cook poultry cuts, including marinated, tenderized, injected cuts of poultry, poultry corn dogs, poultry bagel dogs, poultry croquettes, poultry fritters, cured poultry ham products, adult pureed poultry.	85 g	106 g
Canned poultry, canned chicken, canned[4] turkey	55 g	n/a
Entrees with sauce, turkey and gravy	140 g	n/a
Mixed dishes NOT measurable with a cup;[5] e.g., poultry burrito, poultry enchiladas, poultry pizza, poultry quiche, all types of poultry sandwiches, cracker and poultry lunch-type packages, poultry gyro, poultry stromboli, poultry frank on a bun, poultry burger on a bun, poultry taco, chicken cordon bleu, poultry calzone, poultry lasagna, stuffed vegetables with poultry, poultry kabobs.	140 g (plus 55 g for products toppings)	n/a
Mixed dishes, measurables with a cup; e.g., poultry casserole, macaroni and cheese with poultry, poultry pot pie, poultry spaghetti with sauce, poultry chili, poultry chili with beans, poultry hash, creamed dried poultry, poultry ravioli in sauce, poultry a la king, poultry stew, poultry goulash.	1 cup	n/a
Salads—pasta or potato, potato salad with poultry, macaroni and poultry salad	140 g	n/a
Salads—all other, poultry salads, chicken salad, turkey salad	100 g	n/a
Soups—all varieties	245 g	n/a
Major main entree type sauce; e.g., spaghetti sauce with poultry	125 g	n/a
Minor main entree sauce; e.g., pizza sauce with poultry, gravy	¼ cup	n/a
Seasoning mixes dry, freeze dry, dehydrated, concentrated soup mixes, bases, extracts, dried broths and stock/juice, freeze dry trail mix products with poultry.		
As reconstituted: Amount to make one Reference Amount of the final dish; e.g.—		
Gravy	¼ cup	n/a
Major main entree type sauce	125 g	n/a
Soup	245 g	n/a
Entree measurable with a cup	1 cup	n/a

[1] These values represent the amount of food customarily consumed per eating occasion and were primarily derived from the 1977–78 and the 1987–88 Nationwide Food Consumption Surveys conducted by the U.S. Department of Agriculture.
[2] Manufacturers are required to convert the Reference Amounts to the label serving size in a household measure most appropriate to their specific product using the procedures established by regulation.
[3] Examples listed under Product Category are not all inclusive or exclusive. Examples are provided to assist manufacturers in identifying appropriate product Reference Amount.
[4] If packed or canned in liquid, the Reference Amount is for the drained solids.
[5] Pizza sauce is part of the pizza and is not considered to be a sauce topping.

(c) The Reference Amount for products that represent two or more foods packaged and presented to be consumed together (e.g., lunch meat, cheese, and crackers) shall be the sum of the Reference Amounts for individual foods in the package if the Reference Amount is not listed in section (b) of this section and the product is not a meal-type product.

(d) The Administrator, on his or her own initiative or on behalf of any interested person who has submitted a labeling application, may issue a proposal to establish or amend a Product Category or Reference Amount identified in paragraph (b) of this section.

(1) Labeling applications and supporting documentation to be filed under this section shall be submitted in quadruplicate, except that the supporting documentation may be submitted on a computer disc copy. If any part of the material submitted is in a foreign language, it shall be accompanied by an accurate and complete English translation. The labeling application shall state the applicant's post office address.

(2) Pertinent information will be considered as part of an application on the basis of specific reference to such information submitted to and retained in the files of the Food Safety and Inspection Service. However, any reference to unpublished information furnished by a person other than the applicant will not be considered unless use of such information is authorized (with the understanding that such information may in whole or part be subject to release to the public) in a written statement signed by the person who submitted it. Any reference to published information should be accompanied by reprints or photostatic copies of such references.

(3) The availability for public disclosure of labeling applications, along with supporting documentation, submitted to the Agency under this section will be governed by the rules specified in subchapter D, title 9.

(4) Data accompanying the labeling application, such as food consumption data, shall be submitted on separate sheets, suitably identified. If such data has already been submitted with an earlier labeling application from the applicant, the present labeling application must provide the data.

(5) The labeling application must be signed by the applicant or by his or her attorney or agent, or (if a corporation) by an authorized official.

(6) The labeling application shall include a statement signed by the person responsible for the labeling application, that to the best of his or her knowledge, it is a representative and balanced submission that includes unfavorable information, as well as favorable information, known to him or her pertinent to the evaluation of the labeling application.

(7) Labeling applications for a new Reference Amount and/or Product Category shall be accompanied by the following data which shall be submitted in the following form to the Director, Food Labeling Division, Regulatory Programs, Food Safety and Inspection Service, Washington, DC 20250:

(Date)

The undersigned, _____ submits this labeling application pursuant to 9 CFR 381.412 with respect to Reference Amount and/or Product Category.

Attached hereto, in quadruplicate, or on a computer disc copy, and constituting a part of this labeling application, are the following:

(i) A statement of the objective of the labeling application;

(ii) A description of the product;

(iii) A complete sample product label including nutrition label, using the format established by regulation;

(iv) A description of the form in which the product will be marketed;

(v) The intended dietary uses of the product with the major use identified (e.g., turkey as a luncheon meat);

(vi) If the intended use is primarily as an ingredient in other foods, list of foods or food categories in which the product will be used as an ingredient with information on the prioritization of the use;

(vii) The population group for which the product will be offered for use (e.g., infants, children under 4 years of age);

(viii) The names of the most closely-related products (or in the case of foods for special

dietary use and imitation or substitute foods, the names of the products for which they are offered as substitutes);

(ix) The suggested Reference Amount (the amount of edible portion of food as consumed, excluding bone, skin or other inedible components) for the population group for which the product is intended with full description of the methodology and procedures that were used to determine the suggested Reference Amount. In determining the Reference Amount, general principles and factors in paragraph (a) of this section should be followed.

(x) The suggested Reference Amount shall be expressed in metric units. Reference Amounts for foods shall be expressed in grams except when common household units such as cups, tablespoons, and teaspoons are more appropriate or are more likely to promote uniformity in serving sizes declared on product labels. For example, common household measures would be more appropriate if products within the same category differ substantially in density such as mixed dishes measurable with a cup.

(A) In expressing the Reference Amount in grams, the following general rules shall be followed:

(*1*) For quantities greater than 10 grams, the quantity shall be expressed in nearest 5 grams increment.

(*2*) For quantities less than 10 grams, exact gram weights shall be used.

(B) [Reserved]

(xi) A labeling application for a new subcategory of food with its own Reference Amount shall include the following additional information:

(A) Data that demonstrate that the new subcategory of food will be consumed in amounts that differ enough from the Reference Amount for the parent category to warrant a separate Reference Amount. Data must include sample size, and the mean, standard deviation, median, and modal consumed amount per eating occasion for the product identified in the labeling application and for other products in the category. All data must be derived from the same survey data.

(B) Documentation supporting the difference in dietary usage and product characteristics that affect the consumption size that distinguishes the product identified in the labeling application from the rest of the products in the category.

(xii) In conducting research to collect or process food consumption data in support of the labeling application, the following general guidelines should be followed.

(A) Sampled population selected should be representative of the demographic and socioeconomic characteristics of the target population group for which the food is intended.

(B) Sample size (i.e., number of eaters) should be large enough to give reliable estimates for customarily consumed amounts.

(C) The study protocol should identify potential biases and describe how potential biases are controlled for or, if not possible to control, how they affect interpretation of results.

(D) The methodology used to collect or process data including study design, sampling procedures, materials used (e.g., questionnaire, interviewer's manual), procedures used to collect or process data, methods or procedures used to control for unbiased estimates, and procedures used to correct for nonresponse, should be fully documented.

(xiii) A statement concerning the feasibility of convening associations, corporations, consumers, and other interested parties to engage in negotiated rulemaking to develop a proposed rule.

Yours very truly,

Applicant ———————————

By ———————————

(Indicate authority)

(8) Upon receipt of the labeling application and supporting documentation, the applicant shall be notified, in writing, of the date on which the labeling application was received. Such notice shall inform the applicant that the labeling application is undergoing Agency review and that the applicant shall subsequently be notified of the Agency's decision to consider for further review or deny the labeling application.

(9) Upon review of the labeling application and supporting documentation, the Agency shall notify the applicant, in writing, that the labeling application is either being considered for further review or that it has been summarily denied by the Administrator.

(10) If the labeling application is summarily denied by the Administrator, the written notification shall state the reasons therefor, including why the Agency has determined that the proposed Reference Amount and/or Product Category is false or misleading. The notification letter shall inform the applicant that the applicant may submit a written statement by way of answer to the notification, and that the applicant shall have the right to request a hearing with respect to the merits or validity of the Administrator's decision to deny the use of the proposed Reference Amount and/or Product Category.

(i) If the applicant fails to accept the determination of the Administrator and files an answer and requests a hearing, and the Administrator, after review of the answer, determines the initial determination to be correct, the Administrator shall file with the Hearing Clerk of the Department the notification, answer, and the request for a hearing, which shall constitute the complaint and answer in the proceeding, which shall thereafter be conducted in accordance with the Department's Uniform Rules of Practice.

(ii) The hearing shall be conducted before an administrative law judge with the opportunity for appeal to the Department's Judicial Officer, who shall make the final determination for the Secretary. Any such determination by the Secretary shall be conclusive unless, within 30 days after receipt of notice of such final determination, the applicant appeals to the United States Court of Appeals for the circuit in which the applicant has its principal place of business or to the United States Court of Appeals for the District of Columbia Circuit.

(11) If the labeling application is not summarily denied by the Administrator, the Administrator shall publish in the **Federal Register** a proposed rule to amend the regulations to authorize the use of the Reference Amount and/or Product Category. The proposal shall also summarize the labeling application, including where the supporting documentation can be reviewed. The Administrator's proposed rule shall seek comment from consumers, the industry, consumer and industry groups, and other interested persons on the labeling application and the use of the proposed Reference Amount and/or Product Category. After public comment has been received and reviewed by the Agency, the Administrator shall make a determination on whether the proposed Reference Amount and/or Product Category shall be approved for use on the labeling of poultry products.

(i) If the Reference Amount and/or Product Category is denied by the Administrator, the Agency shall notify the applicant, in writing, of the basis for the denial, including the reason why the Reference Amount and/or Product Category on the labeling was determined by the Agency to be false or misleading. The notification letter shall also inform the applicant that the applicant may submit a written statement by way of answer to the notification, and that the applicant shall have the right to request a hearing with respect to the merits or validity of the Administrator's decision to deny the use of the proposed Reference Amount and/or Product Category.

(A) If the applicant fails to accept the determination of the Administrator and files an answer and requests a hearing, and the Administrator, after review of the answer, determines the initial determination to be correct, the Administrator shall file with the Hearing Clerk of the Department the notification, answer, and the request for a hearing, which shall constitute the complaint and answer in the proceeding, which shall thereafter be conducted in accordance with the Department's Uniform Rules of Practice.

(B) The hearing shall be conducted before an administrative law judge with

the opportunity for appeal to the Department's Judicial Officer, who shall make the final determination for the Secretary. Any such determination by the Secretary shall be conclusive unless, within 30 days after receipt of notice of such final determination, the applicant appeals to the United States Court of Appeals for the circuit in which the applicant has its principal place of business or to the United States Court of Appeals for the District of Columbia.

(ii) If the Reference Amount and/or Product Category is approved, the Agency shall notify the applicant, in writing, and shall also publish in the Federal Register a final rule amending the regulations to authorize the use of the Reference Amount and/or Product Category.

§ 381.413 Nutrient content claims; general principles.

(a) This section applies to poultry products that are intended for human consumption and that are offered for sale, except that nutrient content claims may not be made on products intended specifically for use by infants and toddlers less than 2 years of age.

(b) A claim, which expressly or by implication, characterizes the level of a nutrient (nutrient content claim) of the type required in nutrition labeling pursuant to § 381.409, may not be made on a label or in labeling of that product unless the claim is made in accordance with 21 CFR 101.13(b) through (f).

(c) through (h) [Reserved]

(i) The labeling of a product may contain a statement about the amount or percentage of a nutrient in accordance with 21 CFR 101.13(i) (1) through (3).

(j) Products may bear a statement that compares the level of a nutrient in the product with the level of a nutrient in a reference food in accordance with 21 CFR 101.13(j), except comparison to another manufacturer at 21 CFR 101.13(j)(1)(ii)(B).

(k) The term "modified" may be used in the statement of identity of a product in accordance with 21 CFR 101.13(k).

(l) For purposes of making a claim, a "meal-type product" shall be defined as a product that:

(1) Makes a significant contribution to the diet by weighing at least 6 ounces, but no more than 12 ounces per serving (container), and

(2) Contains ingredients from two or more of the following four food groups:

(i) Bread, cereal, rice and pasta group,

(ii) Fruits and vegetables group,

(iii) Milk, yogurt, and cheese group, and

(iv) Meat, poultry, fish, dry beans, eggs, and nuts group, and

(3) Is represented as, or is in a form commonly understood to be a breakfast, lunch, dinner, meal, main dish, entree, or pizza. Such representations may be made either by statements, photographs, or vignettes.

(m) [Reserved]

(n) Nutrition labeling in accordance with § 381.409 shall be provided for any food for which a nutrient content claim is made.

(o) Compliance with requirements for nutrient content claims shall be in accordance with § 381.409(h).

(p) The Reference Amount shall be used to determine whether a product meets the criteria for a nutrient content claim as discussed in 21 CFR 101.13(p)(1).

(q) The following exemptions apply:

(1) Nutrient content claims that have not been defined by regulation and that appear as part of a brand name that was in use prior to November 27, 1991, may continue to be used as part of that brand name, provided they are not false or misleading under section 4(h) of the Act (21 U.S.C. 453(h)(4)).

(2) [Reserved]

(3) A statement that describes the percentage of a vitamin or mineral in the food in relation to a reference daily intake (RDI) as defined in 21 CFR 101.9(c) may be made on the label.

(4) The requirements of this section do not apply to products for special dietary use as described in § 381.124.

(5) [Reserved]

(6) Nutrient content claims that were part of the name of a product that was subject to a standard of identity as of November 27, 1991, are not subject to the requirements of paragraph (b) of this section whether or not they meet the definition of the descriptive term.

(7) Implied nutrient content claims may be used as part of a brand name, provided that the use of the claim has been authorized by FSIS. Labeling applications requesting approval of such a claim may be submitted pursuant to § 381.469.

§ 381.414–381.442 [Reserved]

§ 381.443 Significant participation for voluntary nutrition labeling.

(a) In evaluating significant participation for voluntary nutrition labeling, FSIS will consider only the major cuts of single-ingredient, raw poultry products, as identified in § 381.444, including those that have been previously frozen.

(b) FSIS will judge a food retailer to be participating at a significant level if the retailer provides nutrition labeling information for at least 90 percent of the major cuts of single-ingredient, raw poultry products, listed in § 381.444, that it sells, and if the nutrition label is consistent in content and format with the mandatory program, or nutrition information is displayed at point-of-purchase in an appropriate manner.

(c) To determine whether there is significant participation by retailers under the voluntary nutrition labeling guidelines, FSIS will select a representative sample of companies allocated by type and size.

(d) FSIS will find that significant participation by food retailers exists if at least 60 percent of all companies that are evaluated are participating in accordance with the guidelines.

(e) FSIS will evaluate significant participation of the voluntary program every 2 years beginning in May 1995.

(1) If significant participation is found, the voluntary nutrition labeling guidelines shall remain in effect.

(2) If significant participation is not found, FSIS shall initiate rulemaking to require nutrition labeling on those products under the voluntary program.

§ 381.444 Identification of major cuts of poultry products.

The major cuts of single-ingredient, raw poultry products are: Whole chicken (without neck and giblets), chicken breast, chicken wing, chicken drumstick, chicken thigh, whole turkey (without necks and giblets; separate nutrient panels for white and dark meat permitted as an option), turkey breast, turkey wing, turkey drumstick, and turkey thigh.

§ 381.445 Guidelines for voluntary nutrition labeling of single-ingredient, raw products.

(a) Nutrition information on the cuts of single-ingredient, raw poultry products, including those that have been previously frozen, shall be provided in the following manner:

(1) If a retailer chooses to provide nutrition information on the label of these products, these products shall be subject to all requirements of the mandatory nutrition labeling program, except that nutrition labeling may be declared on the basis of either "as consumed" or "as packaged." In addition, the declaration of the number of servings per container need not be included in nutrition labeling of single-ingredient, raw poultry products, including those that have been previously frozen.

(2) If a retailer chooses to provide nutrition information at the point-of-purchase by an appropriate means, such as by posting a sign, or by making the information readily available in brochures, notebooks, or leaflet form in close proximity to the food. If a nutrition claim is made on point-of-

purchase materials all of the requirements of the mandatory nutrition labeling program apply. However, if only nutrition information—and not a nutrition claim—is supplied on point-of-purchase materials:

(i) The requirements of the mandatory nutrition labeling program apply, but the nutrition information may be supplied on an "as packaged" or "as consumed," basis;

(ii) The listing of DRV's may be voluntary; and

(iii) The point-of-purchase materials are not subject to any of the format requirements. The nutrition labeling information may also be supplemented by a video, live demonstration, or other media.

(b) [Reserved]

(c) The declaration of nutrition information may be presented in a simplified format as specified in § 381.409(g) for the mandatory nutrition labeling program.

(d) The nutrition label data should be based on either raw or cooked edible portions of poultry cuts with skin. If data are based on cooked portions, the methods used to cook the products must be specified and should be those which do not add nutrients from other ingredients such as flour, breading, and salt. Additional nutritional data may be presented on an optional basis for the raw or cooked edible portions of the skinless poultry meat.

(e) Nutrient data that are the most current representative data base values contained in USDA's National Nutrient Data Bank or its published form, the Agriculture Handbook No. 8 series, may be used for nutrition labeling of single-ingredient, raw poultry products, including those that have been previously frozen. These data may be composite data that reflect different classes of turkey or other variables affecting nutrient content. Alternatively, data that reflect specific classes or other variables may be used, except that if data are used on labels attached to a product which is labeled as to class of poultry or other variables, the data must represent the product in the package when such data are contained in the representative data base. When data are used on labels attached to a product, the data must represent the edible poultry tissues present in the package.

(f) If the nutrition information is in accordance with paragraph (e) of this section, a nutrition label or labeling will not be subject to the Agency compliance review under § 381.409(h), unless a nutrition claim is made on the basis of the representative data base values.

(g) Retailers may use data bases that they believe reflect the nutrient content of single-ingredient, raw poultry products, including those that have been previously frozen; however, such labeling shall be subject to the compliance procedures of paragraph (e) of this section and the requirements specified in this Subpart for the mandatory nutrition labeling program.

§§ 381.446–381.453 [Reserved]

§ 381.454 Nutrient content claims for "good source" and "high".

Nutrient content claims about a nutrient in a product in relation to the Reference Daily Intake (RDI) established for that nutrient in 21 CFR 101.9(c)(11)(iv) or Daily Reference Value (DRV) established for that nutrient in 21 CFR 101.9(c)(12)(i), excluding total carbohydrate and unsaturated fatty acids, may be used on the label or in labeling, in accordance with 21 CFR 101.54(a) through (d).

§ 381.455 [Reserved]

§ 381.456 Nutrient content claims for "light" or "lite".

(a) *General requirements.* The following nutrient content claims using the term "light" or "lite" to describe a product may be used on the label and in labeling, provided that the product is labeled in compliance with 21 CFR 101.56.

(b) The term "light" or "lite" may be used in the brand name of foods to describe the sodium content, provided that:

(1) The product meets the sodium criteria provided in paragraph (a) of this section, and

(2) A statement specifically stating that the product is "light in sodium" or "lite in sodium" appears:

(i) Contiguous to the brand name;

(ii) In uniform type size, style, color, and prominence as the product name; and

(iii) The "light in sodium" or "lite in sodium" statement complies with paragraph (a) of this section.

§§ 381.457–381.459 [Reserved]

§ 381.460 Nutrient content claims for calorie content.

Nutrient content claims about the calorie content of a product may be used on the label or in labeling in accordance with 21 CFR 101.60 (a) through (c).

§ 381.461 Nutrient content claims for sodium content.

Nutrient content claims about the sodium content of a product may be used on the label and in labeling in accordance with 21 CFR 101.61 (a) and (b).

§ 381.462 Nutrient content claims for fat, fatty acids, and cholesterol content of poultry products.

(a) A claim about the level of fat, fatty acid, and cholesterol in a poultry product may only be made on the label and in the labeling of the product in accordance with 21 CFR 101.62 (a) through (d), except 21 CFR 101.62 (c), (d)(1)(i), (d)(1)(ii) (A) through (D), (d)(2)(i), (d)(2)(ii) (A) through (D), (d)(4)(i), (d)(4)(ii) (A) through (D), (d)(5)(i), and (d)(5)(ii) (A) through (D).

(b) The term "low in cholesterol" or "low cholesterol" may be used on the label or in labeling of a meal-type product as defined in § 381.413, provided that the product meets the requirements of 21 CFR 101.62(d)(2), except that requirements of 21 CFR 101.62 (d)(2) (i)(A) and (ii)(A) shall be limited to 20 milligrams of cholesterol per 100 grams, and the requirements of 21 CFR 101.62(d)(2) (i)(B) and (ii)(B) shall be modified to require that the product contain 2 grams or less of saturated fat per 100 grams.

(c) "Lean" and "Extra Lean" Claims. The following nutrient content claims may be used on the label or in labeling, provided that the product is labeled in accordance with § 381.409, and the nutrient content claim complies with § 381.413:

(1) The term "lean" may be used on the label or in labeling of a poultry product, provided that the product contains less than 10 grams fat, less than 4 grams saturated fat, and less than 95 milligrams cholesterol per 100 grams and Reference Amount Customarily Consumed (RACC) for individual foods, and per 100 grams and labeled serving size for meal-type products.

(2) The term "extra lean" may be used on the label or in labeling of a poultry product, provided that the product contains less than 5 grams fat, less than 2 grams saturated fat, and less than 95 milligrams cholesterol per 100 grams and Reference Amount Customarily Consumed (RACC) for individual foods, and per 100 grams and per labeled serving size for meal-type products.

§§ 381.463–381.468 [Reserved]

§ 381.469 Labeling applications for nutrient content claims.

(a) This section pertains to labeling applications for claims, express or implied, that characterize the level of any nutrient required to be on the label or in labeling of product by this subpart.

(b) Labeling applications included in this section are:

(1) Labeling applications for a new (heretofore unauthorized) nutrient content claim,

(2) Labeling applications for a synonymous term (i.e., one that is consistent with a term defined by regulation) for characterizing the level of a nutrient, and

(3) Labeling applications for the use of an implied claim in a brand name.

(c) Labeling applications and supporting documentation to be filed under this section shall be submitted in quadruplicate, except that the supporting documentation may be submitted on a computer disc copy. If any part of the material submitted is in a foreign language, it shall be accompanied by an accurate and complete English translation. The labeling application shall state the applicant's post office address.

(d) Pertinent information will be considered as part of an application on the basis of specific reference to such information submitted to and retained in the files of the Food Safety and Inspection Service. However, any reference to unpublished information furnished by a person other than the applicant will not be considered unless use of such information is authorized (with the understanding that such information may in whole or part be subject to release to the public) in a written statement signed by the person who submitted it. Any reference to published information should be accompanied by reprints or photostatic copies of such references.

(e) If nonclinical laboratory studies accompany a labeling application, the applicant shall include, with respect to each nonclinical study included with the application, either a statement that the study has been, or will be, conducted in compliance with the good laboratory practice regulations as set forth in Part 58 of Chapter 1, Title 21, or, if any such study was not conducted in compliance with such regulations, a brief statement of the reason for the noncompliance.

(f) If clinical investigations accompany a labeling application, the applicant shall include, with respect to each clinical investigation included with the application, either a statement that the investigation was conducted in compliance with the requirements for institutional review set forth in Part 56 of Chapter 1, Title 21, or was not subject to such requirements in accordance with § 56.194 or § 56.105, and that it was conducted in compliance with the requirements for informed consents set forth in Part 50 of Chapter 1, Title 21.

(g) The availability for public disclosure of labeling applications, along with supporting documentation, submitted to the Agency under this section will be governed by the rules specified in Subchapter D, Title 9.

(h) The data specified under this section to accompany a labeling application shall be submitted on separate sheets, suitably identified. If such data has already been submitted with an earlier labeling application from the applicant, the present labeling application must provide the data.

(i) The labeling application must be signed by the applicant or by his or her attorney or agent, or (if a corporation) by an authorized official.

(j) The labeling application shall include a statement signed by the person responsible for the labeling application, that to the best of his or her knowledge, it is a representative and balanced submission that includes unfavorable information, as well as favorable information, known to him or her pertinent to the evaluation of the labeling application.

(k)(1) Labeling applications for a new nutrient content claim shall be accompanied by the following data which shall be submitted in the following form to the Director, Food Labeling Division, Regulatory Programs, Food Safety and Inspection Service, Washington, DC 20250:

(Date)

The undersigned, _____ submits this labeling application pursuant to 9 CFR 381.469 with respect to (statement of the claim and its proposed use).

Attached hereto, in quadruplicate, or on a computer disc copy, and constituting a part of this labeling application, are the following:

(i) A statement identifying the nutrient content claim and the nutrient that the term is intended to characterize with respect to the level of such nutrient. The statement shall address why the use of the term as proposed will not be misleading. The statement shall provide examples of the nutrient content claim as it will be used on labels or labeling, as well as the types of products on which the claim will be used. The statement shall also specify the level at which the nutrient must be present or what other conditions concerning the product must be met for the appropriate use of the term in labels or labeling, as well as any factors that would make the use of the term inappropriate.

(ii) A detailed explanation supported by any necessary data of why use of the food component characterized by the claim is of importance in human nutrition by virtue of its presence or absence at the levels that such claim would describe. This explanation shall also state what nutritional benefit to the public will derive from use of the claim as proposed and why such benefit is not available through the use of existing terms defined by regulation. If the claim is intended for a specific group within the population, the analysis shall specifically address nutritional needs of such group, and scientific data sufficient for such purpose, and data and information to the extent necessary to demonstrate that consumers can be expected to understand the meaning of the term under the proposed conditions of use.

(iii) Analytical data that demonstrates the amount of the nutrient that is present in the products for which the claim is intended. The assays should be performed on representative samples in accordance with 381.409(h). If no USDA or AOAC methods are available, the applicant shall submit the assay method used, and data establishing the validity of the method for assaying the nutrient in the particular food. The validation data shall include a statistical analysis of the analytical and product variability.

(iv) A detailed analysis of the potential effect of the use of the proposed claim on food consumption, and any corresponding changes in nutrient intake. The analysis shall specifically address the intake of nutrients that have beneficial and negative consequences in the total diet. If the claim is intended for a specific group within the population, the above analysis shall specifically address the dietary practices of such group, and shall include data sufficient to demonstrate that the dietary analysis is representative of such group.

Yours very truly,

Applicant _____

By _____

(Indicate authority)

(2) Upon receipt of the labeling application and supporting documentation, the applicant shall be notified, in writing, of the date on which the labeling application was received. Such notice shall inform the applicant that the labeling application is undergoing Agency review and that the applicant shall subsequently be notified of the Agency's decision to consider for further review or deny the labeling application.

(3) Upon review of the labeling application and supporting documentation, the Agency shall notify the applicant, in writing, that the labeling application is either being considered for further review or that it has been summarily denied by the Administrator.

(4) If the labeling application is summarily denied by the Administrator, the written notification shall state the reasons therefor, including why the Agency has determined that the proposed nutrient content claim is false or misleading. The notification letter shall inform the applicant that the applicant may submit a written statement by way of answer to the notification, and that the applicant shall have the right to request a hearing with respect to the merits or validity of the Administrator's decision to deny the use of the proposed nutrient content claim.

(i) If the applicant fails to accept the determination of the Administrator and

files an answer and requests a hearing, and the Administrator, after review of the answer, determines the initial determination to be correct, the Administrator shall file with the Hearing Clerk of the Department the notification, answer, and the request for a hearing, which shall constitute the complaint and answer in the proceeding, which shall thereafter be conducted in accordance with the Department's Uniform Rules of Practice.

(ii) The hearing shall be conducted before an administrative law judge with the opportunity for appeal to the Department's Judicial Officer, who shall make the final determination for the Secretary. Any such determination by the Secretary shall be conclusive unless, within 30 days after receipt of notice of such final determination, the applicant appeals to the United States Court of Appeals for the circuit in which the applicant has its principal place of business or to the United States Court of Appeals for the District of Columbia Circuit.

(5) If the labeling application is not summarily denied by the Administrator, the Administrator shall publish in the Federal Register a proposed rule to amend the regulations to authorize the use of the nutrient content claim. The proposal shall also summarize the labeling application, including where the supporting documentation can be reviewed. The Administrator's proposed rule shall seek comment from consumers, the industry, consumer and industry groups, and other interested persons on the labeling application and the use of the proposed nutrient content claim. After public comment has been received and reviewed by the Agency, the Administrator shall make a determination on whether the proposed nutrient content claim shall be approved for use on the labeling of poultry products.

(i) If the claim is denied by the Administrator, the Agency shall notify the applicant, in writing, of the basis for the denial, including the reason why the claim on the labeling was determined by the Agency to be false or misleading. The notification letter shall also inform the applicant that the applicant may submit a written statement by way of answer to the notification, and that the applicant shall have the right to request a hearing with respect to the merits or validity of the Administrator's decision to deny the use of the proposed nutrient content claim.

(A) If the applicant fails to accept the determination of the Administrator and files an answer and requests a hearing, and the Administrator, after review of the answer, determines the initial determination to be correct, the Administrator shall file with the Hearing Clerk of the Department the notification, answer, and the request for a hearing, which shall constitute the complaint and answer in the proceeding, which shall thereafter be conducted in accordance with the Department's Uniform Rules of Practice.

(B) The hearing shall be conducted before an administrative law judge with the opportunity for appeal to the Department's Judicial Officer, who shall make the final determination for the Secretary. Any such determination by the Secretary shall be conclusive unless, within 30 days after receipt of the notice of such final determination, the applicant appeals to the United States Court of Appeals for the circuit in which the applicant has its principal place of business or to the United States Court of Appeals for the District of Columbia Circuit.

(ii) If the claim is approved, the Agency shall notify the applicant, in writing, and shall also publish in the Federal Register a final rule amending the regulations to authorize the use of the claim.

(l)(1) Labeling applications for a synonymous term shall be accompanied by the following data which shall be submitted in the following form to the Director, Food Labeling Division, Regulatory Programs, Food Safety and Inspection Service, Washington, DC 20250:

(Date)

The undersigned, _____ submits this labeling application pursuant to 9 CFR 381.469 with respect to (statement of the synonymous term and its proposed use in a nutrient content claim that is consistent with an existing term that has been defined under subpart Y of part 381).

Attached hereto, in quadruplicate, or on a computer disc copy, and constituting a part of this labeling application, are the following:

(i) A statement identifying the synonymous term, the existing term defined by a regulation with which the synonymous term is claimed to be consistent, and the nutrient that the term is intended to characterize the level of. The statement shall address why the use of the synonymous term as proposed will not be misleading. The statement shall provide examples of the nutrient content claim as it will be used on labels or labeling, as well as the types of products on which the claim will be used. The statement shall also specify whether any limitations not applicable to the use of the defined term are intended to apply to the use of the synonymous term.

(ii) A detailed explanation supported by any necessary data of why use of the proposed term is requested, including whether the existing defined term is inadequate for the purpose of effectively characterizing the level of a nutrient. This explanation shall also state what nutritional benefit to the public will derive from use of the claim as proposed, and why such benefit is not available through use of existing terms defined by regulation. If the claim is intended for a specific group within the population, the analysis shall specifically address nutritional needs of such group, scientific data sufficient for such purpose, and data and information to the extent necessary to demonstrate that consumers can be expected to understand the meaning of the term under the proposed conditions of use.

Yours very truly,

(2) Upon receipt of the labeling application and supporting documentation, the applicant shall be notified, in writing, of the date on which the labeling application was received. Such notice shall inform the applicant that the labeling application is undergoing Agency review and that the applicant shall subsequently be notified of the Agency's decision to consider for further review or deny the labeling application.

(3) Upon review of the labeling application and supporting documentation, the Agency shall notify the applicant, in writing, that the labeling application is either being considered for further review or that it has been summarily denied by the Administrator.

(4) If the labeling application is summarily denied by the Administrator, the written notification shall state the reasons therefor, including why the Agency has determined that the proposed synonymous term is false or misleading. The notification letter shall inform the applicant that the applicant may submit a written statement by way of answer to the notification, and that the applicant shall have the right to request a hearing with respect to the merits or validity of the Administrator's decision to deny the use of the proposed synonymous term.

(i) If the applicant fails to accept the determination of the Administrator and files an answer and requests a hearing, and the Administrator, after review of the answer, determines the initial determination to be correct, the Administrator shall file with the Hearing Clerk of the Department the notification, answer, and the request for a hearing, which shall constitute the complaint and answer in the proceeding, which shall thereafter be conducted in accordance with the Department's Uniform Rules of Practice.

(ii) The hearing shall be conducted before an administrative law judge with the opportunity for appeal to the

Department's Judicial Officer, who shall make the final determination for the Secretary. Any such determination by the Secretary shall be conclusive unless, within 30 days after receipt of notice of such final determination, the applicant appeals to the United States Court of Appeals for the circuit in which the applicant has its principal place of business or to the United States Court of Appeals for the District of Columbia Circuit.

(5) If the claim is approved, the Agency shall notify the applicant, in writing, and shall publish in the **Federal Register** a notice informing the public that the synonymous term has been approved for use.

(m)(1) Labeling applications for the use of an implied nutrient content claim in a brand name shall be accompanied by the following data which shall be submitted in the following form to the Director, Food Labeling Division, Regulatory Programs, Food Safety and Inspection Service, Washington, DC 20250:

(Date)

The undersigned, _____ submits this labeling application pursuant to 9 CFR 381.469 with respect to (statement of the implied nutrient content claim and its proposed use in a brand name).

Attached hereto, in quadruplicate, or on a computer disc copy, and constituting a part of this labeling application, are the following:

(i) A statement identifying the implied nutrient content claim, the nutrient the claim is intended to characterize, the corresponding term for characterizing the level of such nutrient as defined by a regulation, and the brand name of which the implied claim is intended to be a part. The statement shall address why the use of the brand-name as proposed will not be misleading. The statement shall provide examples of the types of products on which the brand name will appear. It shall also include data showing that the actual level of the nutrient in the food would qualify the label of the product to bear the corresponding term defined by regulation. Assay methods used to determine the level of a nutrient shall meet the requirements stated under labeling application format in paragraph (k)(1)(iii) of this section.

(ii) A detailed explanation supported by any necessary data of why use of the proposed brand name is requested. This explanation shall also state what nutritional benefit to the public will derive from use of the brand name as proposed. If the branded product is intended for a specific group within the population, the analysis shall specifically address nutritional needs of such group and scientific data sufficient for such purpose.

Yours very truly,

Applicant _____

By _____

(2) Upon receipt of the labeling application and supporting documentation, the applicant shall be notified, in writing, of the date on which the labeling application was received. Such notice shall inform the applicant that the labeling application is undergoing Agency review and that the applicant shall subsequently be notified of the Agency's decision to consider for further review or deny the labeling application.

(3) Upon review of the labeling application and supporting documentation, the Agency shall notify the applicant, in writing, that the labeling application is either being considered for further review or that it has been summarily denied by the Administrator.

(4) If the labeling application is summarily denied by the Administrator, the written notification shall state the reasons therefor, including why the Agency has determined that the proposed implied nutrient content claim is false or misleading. The notification letter shall inform the applicant that the applicant may submit a written statement by way of answer to the notification, and that the applicant shall have the right to request a hearing with respect to the merits or validity of the Administrator's decision to deny the use of the proposed implied nutrient content claim.

(i) If the applicant fails to accept the determination of the Administrator and files an answer and requests a hearing, and the Administrator, after review of the answer, determines the initial determination to be correct, the Administrator shall file with the Hearing Clerk of the Department the notification, answer, and the request for a hearing, which shall constitute the complaint and answer in the proceeding, which shall thereafter be conducted in accordance with the Department's Uniform Rules of Practice.

(ii) The hearing shall be conducted before an administrative law judge with the opportunity for appeal to the Department's Judicial Officer, who shall make the final determination for the Secretary. Any such determination by the Secretary shall be conclusive unless, within 30 days after receipt of notice of such final determination, the applicant appeals to the United States Court of Appeals for the circuit in which the applicant has its principal place of business or to the United States Court of Appeals for the District of Columbia Circuit.

(5) If the labeling application is not summarily denied by the Administrator, the Administrator shall publish a notice of the labeling application in the **Federal Register** seeking a comment on the use of the implied nutrient content claim. The notice shall also summarize the labeling application, including where the supporting documentation can be reviewed. The Administrator's notice rule shall seek comment from consumers, the industry, consumer and industry groups, and other interested persons on the labeling application and the use of the implied nutrient content claim. After public comment has been received and reviewed by the Agency, the Administrator shall make a determination on whether the implied nutrient content claim shall be approved for use on the labeling of poultry products.

(i) If the claim is denied by the Administrator, the Agency shall notify the applicant, in writing, of the basis for the denial, including the reason why the claim on the labeling was determined by the Agency to be false or misleading. The notification letter shall also inform the applicant that the applicant may submit a written statement by way of answer to the notification, and that the applicant shall have the right to request a hearing with respect to the merits or validity of the Administrator's decision to deny the use of the proposed implied nutrient content claim.

(A) If the applicant fails to accept the determination of the Administrator and files an answer and requests a hearing, and the Administrator, after review of the answer, determines the initial determination to be correct, the Administrator shall file with the Hearing Clerk of the Department the notification, answer, and the request for a hearing, which shall constitute the complaint and answer in the proceeding, which shall thereafter be conducted in accordance with the Department's Uniform Rules of Practice.

(B) The hearing shall be conducted before an administrative law judge with the opportunity for appeal to the Department's Judicial Officer, who shall make the final determination for the Secretary. Any such determination by the Secretary shall be conclusive unless, within 30 days after receipt of the notice of such final determination, the applicant appeals to the United States Court of Appeals for the circuit in which the applicant has its principal place of business or to the United States Court of Appeals for the District of Columbia Circuit.

(ii) If the claim is approved, the Agency shall notify the applicant, in writing, and shall also publish in the **Federal Register** a notice informing the public that the implied nutrient content claim has been approved for use.

§ 381.470–381.479 [Reserved]

§ 381.480 Label statements relating to usefulness in reducing or maintaining body weight.

(a) *General requirements.* Any product that purports to be or is represented for special dietary use because of usefulness in reducing body weight shall bear:

(1) Nutrition labeling in conformity with § 381.409 of this subpart, unless exempt under that section, and

(2) A conspicuous statement of the basis upon which the product claims to be of special dietary usefulness.

(b) *Nonnutritive ingredients.* (1) Any product subject to paragraph (a) of this section that achieves its special dietary usefulness by use of a nonnutritive ingredient (i.e., one not utilized in normal metabolism) shall bear on its label a statement that it contains a nonnutritive ingredient and the percentage by weight of the nonnutritive ingredient.

(2) A special dietary product may contain a nonnutritive sweetener or other ingredient only if the ingredient is safe for use in the product under the applicable law and regulations of this chapter. Any product that achieves its special dietary usefulness in reducing or maintaining body weight through the use of a nonnutritive sweetener shall bear on its label the statement required by paragraph (b)(1) of this section, but need not state the percentage by weight of the nonnutritive sweetener. If a nutritive sweetener(s) as well as nonnutritive sweetener(s) is added, the statement shall indicate the presence of both types of sweetener; e.g., "Sweetened with nutritive sweetener(s) and nonnutritive sweetener(s)."

(c) *"Low calorie" foods.* A product purporting to be "low calorie" must comply with the criteria set forth for such foods in § 381.460(b) (2) and (3).

(d) *"Reduced calorie" foods and other comparative claims.* A product purporting to be "reduced calorie" or otherwise containing fewer calories than a reference food must comply with the criteria set forth for such foods in § 387.460(b) (4) and (5).

§§ 381.481–381.499 [Reserved]

§ 381.500 Exemption from nutrition labeling.

(a) The following poultry food products are exempt from nutrition labeling:

(1) Products produced by small businesses, provided that the labels for these products bear no nutrition claims or nutrition information,

(i) A food product, for purposes of the small business exemption, is defined as a formulation, not including distinct flavors which do not significantly alter the nutritional profile, sold in any size package in commerce.

(ii) For purposes of this paragraph, a small business is any single-plant facility or multi-plant company/firm that employs 500 or fewer people and produces no more than the following amounts of pounds of the product qualifying the firm for exemption from this subpart:

(A) During the first year of implementation of nutrition labeling, from July 1994 to July 1995, 250,000 pounds or less,

(B) During the second year of implementation of nutrition labeling, from July 1995 to July 1996, 175,000 pounds or less, and

(C) During the third year of implementation and subsequent years thereafter, 100,000 pounds or less.

(2) Products intended for further processing, provided that the labels for these products bear no nutrition claims or nutrition information,

(3) Products that are not for sale to consumers, provided that the labels for these products bear no nutrition claims or nutrition information,

(4) Products in small packages that are individually wrapped packages of less than ½ ounce net weight, provided that the labels for these products bear no nutrition claims or nutrition information,

(5) Products custom slaughtered or prepared,

(6) Products intended for export, and

(7) The following products prepared and served or sold at retail provided that the labels or the labeling of these products bear no nutrition claims or nutrition information:

(i) Ready-to-eat products that are packaged or portioned at a retail store or similar retail-type establishment; and

(ii) Multi-ingredient products (e.g. sausage) processed at a retail store or similar retail-type establishment.

(b) Restaurant menus generally do not constitute labeling or fall within the scope of these regulations.

(c) Foods represented to be specifically for infants and children less than 2 years of age shall bear nutrition labeling, except such labeling shall not include calories from fat, calories from saturated fat, saturated fat, polyunsaturated fat, monounsaturated fat, and cholesterol. Foods represented to be specifically for infants and children less than 4 years of age shall bear nutrition labeling, except that such labeling shall not include listings of percent of daily value and the daily value list. Nutrient names and quantitative amounts by weight shall be presented in two separate columns.

Done at Washington, DC, on: December 24, 1992.

H. Russell Cross,

Administrator, Food Safety and Inspection Service.

Department of Agriculture

Food Safety and Inspection Service

9 CFR Parts 317 and 381

Nutrition Labeling: Use of "Healthy" and Similar Terms on Meat and Poultry Product Labeling; Proposed Rule

DEPARTMENT OF AGRICULTURE

Food Safety and Inspection Service

9 CFR Parts 317 and 381

[Docket No. 91-006P-HLTH]

RIN 0583-AB34

Nutrition Labeling: Use of "Healthy" and Similar Terms on Meat and Poultry Product Labeling

AGENCY: Food Safety and Inspection Service, USDA.

ACTION: Proposed rule.

SUMMARY: The Food Safety and Inspection Service is proposing to amend the Federal meat and poultry products inspection regulations to permit the use of the term "healthy" or any other derivative of the term "healthy," such as "healthful" or "healthier," on the labeling of meat and poultry products. FSIS is engaging in rulemaking proceedings to establish nutrition labeling regulations for meat and poultry products. This action is intended to provide consumers with accurate, informative labeling on meat and poultry products.

DATES: Comments must be received on or before February 5, 1993.

ADDRESSES: Written comments to: Policy Office, ATTN: Linda Carey, FSIS Hearing Clerk, Room 3171, South Building, Food Safety and Inspection Service, U.S. Department of Agriculture, Washington, DC 20250. Oral comments as provided by the Poultry Products Inspection Act should be directed to: Mr. Charles R. Edwards at (202) 205-0080. (See also "Comments" under "SUPPLEMENTARY INFORMATION.")

FOR FURTHER INFORMATION CONTACT: Charles R. Edwards, Director, Product Assessment Division, Regulatory Programs, Food Safety and Inspection Service, U.S. Department of Agriculture, Washington, DC 20250, (202) 205-0080.

SUPPLEMENTARY INFORMATION: The Agency advises that it intends to make any final rule that derives from this rulemaking effective the same effective date as the final rule titled, "Nutrition Labeling of Meat and Poultry Products" (published elsewhere in this issue of the Federal Register). If, for some reason, a final rule on "healthy" and similar terms is not issued in time to meet the same effective date as FSIS's final rule on nutrition labeling, the use of "healthy" and similar terms would be subject to the nutrient content claim provisions set forth in the final rule on nutrition labeling.

Executive Order 12291 and Effect on Small Entities

FSIS is publishing elsewhere in this issue of the Federal Register a final rule on nutrition labeling of meat and poultry products. The rule was reviewed under USDA procedures established to implement Executive Order 12291 and was classified as a major rule pursuant to section 1(b)(1) of that order because it is likely to result in an annual effect on the economy of $100 million or more. The review is reported in a Final Regulatory Impact Analysis (FRIA) which is available for review in the FSIS Hearing Clerk's office. The FRIA also satisfies the analysis requirements of the Regulatory Flexibility Act (Pub. L. 96-354, 5 U.S.C. 601 *et seq.*) which deals with the effect on small entities.

This proposed rule is one element of the overall nutrition labeling rulemaking which was considered in the FRIA. A summary of the FRIA can be found in the Agency's final rule on nutrition labeling published elsewhere in this issue of the Federal Register.

Executive Order 12778

This proposed rule has been reviewed pursuant to Executive Order 12778, Civil Justice Reform. This proposed rule seeks comments on provisions for permitting the use of the term "healthy" or any other derivative of the term "health" on the labeling of meat and poultry products.

This proposed rule concerns labeling of meat and poultry products. States and local jurisdictions are preempted under the Federal Meat Inspection Act (FMIA) and the Poultry Products Inspection Act (PPIA) from imposing any marking, labeling, packaging, or ingredient requirements on federally inspected meat or poultry products that are in addition to, or different than, those imposed under the FMIA or the PPIA. States and local jurisdictions may, however, exercise concurrent jurisdiction over meat and poultry products that are outside official establishments for the purpose of preventing the distribution of meat and poultry products that are misbranded or adulterated under the FMIA or PPIA, or, in the case of imported articles, which are not at such an establishment, after their entry into the United States. Under the FMIA and the PPIA, States that maintain meat and poultry inspection programs must impose requirements on State inspected products and establishments that are at least equal to those imposed on federally inspected products and establishments under the FMIA or PPIA. These States may, however, impose more stringent requirements on such State inspected products and establishments.

If adopted, no retroactive effect would be given to this proposed rule, and applicable administrative procedures must be exhausted before any judicial challenge to its provisions or their application. Those administrative procedures are set forth in the rules of practice governing proceedings for labeling determinations at 9 CFR parts 335 and 381, subpart W.

Paperwork Requirements

This proposed rule specifies the regulations permitting the use of the term "healthy," or any other derivative of the term "health" on the labeling of meat and poultry products.

The paperwork requirements contained in this proposed rule were incorporated into the Information Collection Request on Nutrition Labeling of Meat and Poultry Products which has been submitted to the Office of Management and Budget.

Regulatory Reform

Less Burdensome or More Efficient Alternatives

The Department of Agriculture is committed to carrying out its statutory and regulatory mandates in a manner that best serves the public interest. Therefore, where legal discretion permits, the Department actively seeks to promulgate regulations that promote economic growth, create jobs, are minimally burdensome, and are easy for the public to understand, use or comply with. In short, the Department is committed to issuing regulations that maximize net benefits to society and minimize costs imposed by those regulations. This principle is articulated in President's Bush's January 28, 1992, memorandum to agency heads, and in Executive Orders 12291 and 12498. The Department applies this principle to the fullest extent possible, consistent with law.

The Department has developed and reviewed this regulatory proposal in accordance with these principles. Nonetheless, the Department believes that public input from all interested persons can be invaluable to ensuring that the final regulatory product is minimally burdensome and maximally efficient. Therefore, the Department specifically seeks comments and suggestions from the public regarding any less burdensome or more efficient alternative that would accomplish the purposes described in the proposal. Such comments should be addressed to

the Agency as provided in the "Comments" section below.

Comments

Interested persons are invited to submit comments concerning this proposed rule. Written comments should be sent to the Policy Office and refer to Docket No. 91–006P–HLTH. Any person desiring an opportunity for an oral presentation of views as provided by the Poultry Products Inspection Act should make such request to Charles R. Edwards so that arrangements can be made for such views to be presented. A record will be made of all views orally presented. All comments submitted in response to this proposed rule will be available for public inspection in the Policy Office from 9 a.m. to 12:30 p.m. and from 1:30 p.m. to 4 p.m., Monday through Friday.

Background

On November 27, 1991, FSIS published in the **Federal Register** a proposed rule entitled "Nutrition Labeling of Meat and Poultry Products" (56 FR 60302). In addition to proposing specific regulations for nutrition labeling, the Agency solicited comments on the appropriateness and usefulness of the term "healthy" on the labeling of meal-type products, and requested specific information on the criteria for the use of such term. The proposed rule would permit voluntary nutrition labeling on single-ingredient, raw meat and poultry products, and would establish mandatory nutrition labeling for most processed meat and poultry products.

Published elsewhere in this issue of the **Federal Register** is FSIS's final rule on nutrition labeling, which does not contain regulatory provisions covering the use of the term "healthy." Because the public has not been afforded the opportunity to comment on the regulatory provisions proposed herein, FSIS is issuing this proposed rule to allow public comment prior to issuing a final rule. The following discussion addresses the use of the term "healthy" on meat and poultry products, the comments received in response to the proposal relevant to this issue, and the regulatory provisions established to respond to the concerns of the issue.

As previously mentioned, FSIS solicited comments, in its November 1991 proposal, on the use of the term "healthy" on labeling of meal-type products. FSIS stated in the proposal that nutrient content claims not defined by regulation that appear as part of the brand name may be used on the label or in labeling if they are not false or misleading and only if the brand name was in use prior to November 27, 1991 (publication date of the proposal). The term "healthy" was not defined. The Agency specifically solicited comments on how best to determine when a term incorporated into a brand name should be regulated as a nutrient content claim.

FSIS included, in the proposal, examples of products with brand names, trade names, and product lines, that contain nutrient content claims, which may be affected by the proposed rule. The list of examples, which was not all inconclusive, contained 19 such products that include the term "healthy" or a derivative of the term "health," including "Light & Healthy," "Healthy Choice," "LeMenu Healthy," "HealthCheck," "Healthy Deli," and "Lean & Healthy."

The majority of the responses received from FSIS's solicitation for comments on the criteria for the term "healthy" suggested that the term be defined by meeting several criteria. Some comments suggested that the products should qualify if they meet several of the "low" criteria for certain nutrients. Others recommended that the term be equated with controlled amounts of fat, saturated fatty acids, cholesterol, and sodium. A few comments stated that, not only should the term equate controlled amounts of fat, saturated fatty acids, cholesterol, and sodium, use of the term should meet the "high" definition for a certain number of micronutrients.

In its final rule on nutrition labeling, FSIS discusses the rationale and basis for defining the terms "lean" and "extra lean." The primary focus of the Agency's decision to define these terms was to provide meat and poultry products with nutrient content claims that could be used to distinguish between products in that category that contained less fat, saturated fatty acids, and cholesterol. "Lean" is defined for a product that contains less than 10 grams of fat, less than 4 grams of saturated fatty acids, and less than 95 milligrams of cholesterol. The Agency believes that these levels are appropriate "disqualifying" levels (i.e., levels above which would disqualify the food from making a health claim) to apply to the term "healthy" because they are based on dietary recommendations for Americans. Therefore, this proposed rule would permit the term "healthy" to be used on the label of meat and poultry products, provided the product contains less than 10 grams of fat, less than 4 grams of saturated fatty acids, less than 95 milligrams of cholesterol, and less than 480 milligrams of sodium per 100 grams and Reference Amount Customarily Consumed for individual foods, and per 100 grams and labeled serving for meal-type products. In addition, products bearing the term "healthy" must comply with the nutrition label contents prescribed in 9 CFR 317.309 and 381.409, and the labeling of such products must comply with nutrient content claims provisions, prescribed in 9 CFR 317.313 and 381.413 (see FSIS's final rule on nutrition labeling).

On November 27, 1991, the Food and Drug Administration (FDA) also proposed regulations to require nutrition labeling on most foods that are meaningful sources of nutrients, to revise the list of required nutrients and food components and the conditions for declaring them in nutrition labeling, and to establish up-to-date reference standards for those nutrients and food components.

In response to comments received on its general principles proposal, FDA is proposing a definition of the term "healthy," published elsewhere in this issue of the **Federal Register.** As proposed by FDA, uses of the term "healthy" that refer only to general dietary guidance, such as "eat lots of fruits and vegetables for a healthy diet," would not be implied nutrient content claims and would not be subject to any requirements. FDA believes that the term "healthy" constitutes an implied nutrient content claim only when it appears in a nutritional context, such as when the term is associated with an explicit or implicit claim or statement about a nutrient. An example of "healthy" used as an implied claim would be "Healthy, contains 5 grams of fat." The term "healthy," when used in this context, would be subject to a definition under FDA's proposal.

Both FSIS and FDA received comments suggesting that the definition for "healthy" should focus on restrictions for fat, saturated fat, sodium, and cholesterol, because these nutrients are of particular significance to public health. The agencies are tentatively in agreement with these comments and, accordingly, both FSIS and FDA have incorporated these four nutrients into their proposed definitions of "healthy."

Many recommendations for healthy diets from professional health organizations and the U.S. Dietary Guidelines for Americans advise choosing lean meat and poultry as a means of achieving a healthy diet. Food consumption data indicates that 89 percent of Americans eat meat and poultry on a daily basis. In its final rule on nutrition labeling, FSIS provides guidelines for the term "lean" that include restricted levels of fat, saturated fat, and cholesterol. FSIS believes it is

important to convey to consumers consistent dietary messages. Likewise, from a consumer education standpoint, it is essential to communicate analogous messages concerning healthy diets and the role meat and poultry products can play in achieving balanced, healthy diets.

FDA's definition for "healthy" applies to products that do not exceed the disqualifying level for sodium or cholesterol and are low in fat and saturated fat. Many cuts of meat and poultry would not meet such a definition. In order to maintain a consistent dietary message, FSIS believes that linking the definition of "lean" to the definition of "healthy" is an appropriate connection. Therefore, the Agency is proposing to define the term "healthy" with parallel levels for fat, saturated fat, and cholesterol as "lean," above which products would not be eligible for use of the term. In addition, the Agency believes a sodium requirement should be a criterion for eligibility because FSIS agrees with comments received suggesting that sodium be considered in defining "healthy." For the sodium requirement, FSIS is proposing that 480 milligrams would be the limit, parallelling FDA's sodium requirement for individual foods. The levels for the term "healthy" would be applied to both individual foods and meal-type products, with the criterion for individual foods per 100 grams and Reference Amount Customarily Consumed, and per 100 grams and labeled serving for meal-type products. The Agency also believes that any use of the term "healthy," whether in a brand name or used in conjunction with a nutrient, must meet this requirement. The Agency will refer to these levels as "disqualifying" levels.

In comparing the FSIS and FDA disqualifying levels for cholesterol and sodium for individual foods, the sodium levels are the same (480 milligrams); however, the FSIS cholesterol level of 95 milligrams is slightly higher than that of FDA's level of 60 milligrams. The higher cholesterol level is expected for meat and poultry products since these products contain inherent cholesterol, while products regulated by FDA typically contain no cholesterol.

In comparing the FSIS and FDA disqualifying levels for cholesterol and sodium for main dishes, FDA's proposed sodium level of 720 milligrams is one and a half times higher than the level proposed by FSIS, and FDA's cholesterol level (90 milligrams) is similar. FDA's proposed sodium level of 960 milligrams and cholesterol level of 120 milligrams are higher than FSIS's proposed levels for meal-type products. FSIS specifically requests comments on its proposed sodium and cholesterol levels.

Americans are interested in lowering their sodium intake because they are increasingly aware of the role sodium plays in hypertension. Two major public health reports, the Surgeon General's report on "Nutrition and Health" and the National Research Council report "Diet and Health: Implications for Reducing Chronic Disease Risk" identify high blood pressure as one of America's ten major chronic diseases that are affected by daily dietary patterns.

Hypertension is a major risk factor for heart disease, which is the leading cause of death in the U.S., and for stroke, the third most frequent cause of death. In addition, hypertension is also a problem in renal failure. Prevalence of hypertension increases with age in the U.S. population and is higher for black Americans (38 percent) than for white Americans.

Although the link between sodium intake and high blood pressure is not completely understood, a committee of the National Institute of Health's National Heart, Lung and Blood Institute recently issued new recommendations to lower Americans' blood pressure, including drastically reducing daily intake of salt.

The food industry has responded to this consumer interest by the development of a variety of products with lower sodium levels. Since as much as 80 percent of the salt consumed each day by the average American comes from processed foods, it is important to continue to provide incentives to the food industry to develop and market reduced sodium foods.

Although FDA and FSIS define "healthy" differently, FSIS believes this is one area where it is appropriate. Meat and poultry products are different from other foods in that all meat and poultry products contain fat, saturated fat, and cholesterol. In addition, cholesterol is not ubiquitous in the food supply but only found in foods of animal origin.

This proposed rule would apply the criteria for "healthy" to any term used anywhere on the label that includes the term "health." This includes, but is not limited to, the following terms:

Health
Healthy
Healthful
Healthfully
Healthfulness
Healthier
Healthiest
Healthily

Healthiness

Thus, this proposed rule would permit the use of the term "healthy" or any other derivative of the term "health" under the conditions described above.

List of Subjects

9 CFR Part 317

Food labeling, Meat inspection.

9 CFR Part 381

Food labeling, Poultry and poultry products.

The Proposed Rule

For the reasons discussed in the preamble, FSIS is proposing to amend 9 CFR parts 317 and 381 of the Federal meat and poultry products inspection regulations to read as follows:

Note: The following proposed amendments are based on the final rule published elsewhere in this issue which becomes effective July 6, 1994.

PART 317—LABELING, MARKING DEVICES, AND CONTAINERS

1. The authority citation for part 317 would continue to read as follows:

Authority: 21 U.S.C. 601–695; 7 CFR 2.17, 2.55.

2. Section 317.309 would be amended by adding a new paragraph (j) to read as follows:

§ 317.309 Nutrition label content.

* * * * *

(j) The term "healthy" or any other derivative of the term "health" may be used on the label or in labeling of a meat product, provided that:

(1) The product contains less than 10 grams of fat, less than 4 grams of saturated fatty acids, less than 95 milligrams of cholesterol, and less than 480 milligrams of sodium per 100 grams and Reference Amount Customarily Consumed for individual foods, and per 100 grams and labeled serving for meal-type products, as defined in § 317.313(l),

(2) The product is labeled in compliance with this section, and

(3) The term complies with the requirements of § 317.313.

PART 381—POULTRY PRODUCTS INSPECTION REGULATIONS

3. The authority citation for part 381 would continue to read as follows:

Authority: 7 U.S.C. 450, 21 U.S.C. 451–470, 7 CFR 2.17, 2.55.

4. Section 381.409 would be amended by adding a new paragraph (j) to read as follows:

§ 381.409 Nutrition label content.

* * * * *

(j) The term "healthy" or any other derivative of the term "health" may be used on the label or in labeling of a poultry product, provided that:

(1) The product contains less than 10 grams of fat, less than 4 grams of saturated fatty acids, less than 95 milligrams of cholesterol, and less than 480 milligrams of sodium per 100 grams and Reference Amount Customarily Consumed for individual foods, and per 100 grams and labeled serving for meal-type products, as defined in § 381.413(l),

(2) The product is labeled in compliance with this section, and

(3) The term complies with the requirement of § 381.413.

Done at Washington, DC, on: December 24, 1992.

Food Labeling Regulations Implementing the Nutrition Labeling and Education Act of 1990; Opportunity for Comments

AGENCY: Food and Drug Administration, HHS.

ACTION: Final rule; opportunity for comments.

SUMMARY: The Food and Drug Administration (FDA) is announcing that it is revoking the regulations implementing section 403(q) and (r) of the Federal Food, Drug, and Cosmetic Act (the act), and the lists implementing section 6 of the Nutrition Labeling and Education Act of 1990 (the 1990 amendments), that were considered final by operation of law as of November 8, 1992 (hereinafter referred to as the November 8 regulations). Elsewhere in this issue of the **Federal Register**, FDA is adopting final rules based on public comment to replace the November 8 regulations. FDA is taking this action to ensure that the final regulations that implement the 1990 amendments are those based on full public comment, and that those regulations are put in place without delay.

DATES: Effective January 6, 1993. Comments by February 5, 1993.

ADDRESSES: Submit written comments to the Dockets Management Branch (HFA–305), Food and Drug Administration, rm. 1–23, 12420 Parklawn Dr., Rockville, MD 20857.

FOR FURTHER INFORMATION CONTACT: Frank E. Scarbrough, Center for Food Safety and Applied Nutrition (HFS–150), Food and Drug Administration, 200 C St. SW., Washington, DC 20204, 202–205–4561.

SUPPLEMENTARY INFORMATION:

I. Background

On November 8, 1990, President Bush signed the 1990 amendments into law. Sections 2, 3, and 6 of the 1990 amendments gave FDA 24 months from the date of their enactment to promulgate final rules implementing those sections. In response, FDA published proposals on November 27, 1991 (56 FR 60366 through 60878) and July 28, 1992 (57 FR 33283).

Sections 2(b)(2) and 3(b)(2) of the 1990 amendments provided that, if final rules to implement section 403(q) and (r) of the act, respectively, were not promulgated by November 8, 1992, then the regulations proposed to implement these sections of the act were to be considered as final regulations. There are similar provisions in section 6(b)(3)(D) of the 1990 amendments.

The 24-month period established by the 1990 amendments expired on Sunday, November 8, 1992, without the issuance of final rules implementing section 403(q) and (r) of the act or section 6 of the 1990 amendments. Thus, on November 8, 1992, the proposed regulations implementing those sections of the act and section 6 of the 1990 amendments were considered final regulations by operation of law. Under sections 2(b)(2) and 3(b)(2) of the 1990 amendments, FDA was directed to promptly publish in the **Federal Register** notice of the new status of the proposed regulations. FDA published that notice on November 27, 1992 (57 FR 56347).

II. The Revocation

The triggering of the mechanism established in sections 2(b)(2), 3(b)(2), and 6(b)(3) of the 1990 amendments did not toll the rulemakings instituted on November 27, 1991, and July 28, 1992, in response to sections 2, 3, and 6 of the 1990 amendments. Elsewhere in this issue of the **Federal Register**, FDA is publishing the final rules that are the culmination of those rulemakings. FDA has concluded that the final rules based on public comment should replace the November 8 regulations.

Because the agency is completing the rulemaking process begun in 1991, it is necessary to revoke the November 8 regulations so that only the rules that have had the benefit of full notice-and-comment procedures are in effect and provide a basis on which industry can begin to conform its food labels to the new requirements. This revocation does not constitute a reversal of the agency's former views as expressed in the November 27, 1991, and July 28, 1992, proposals and in the November 8 regulations, except to the extent that any changes, in accordance with the Administrative Procedure Act (5 U.S.C. 553(b)), are a logical outgrowth of the proposals. To the extent that differences exist between the November 8 regulations and the new final rules, a reasoned analysis for the changes is supplied in the preambles to the final rules published elsewhere in this issue of the **Federal Register**.

The legislative history of the 1990 amendments states that, if the deadline for publishing final rules based on public comment was not met, there would be good cause to consider the proposed regulations as final regulations because of the importance of mandatory nutrition labeling, rules on claims, and a unified system of regulations on misbranding. The legislative history also pointed to the fact that Congress expected the agency to have received public input prior to issuing the proposed regulations (H. Rept. 101–538, 101st Cong., 2d sess. 18–19 (1990)). The November 8 regulations were to be considered final rules to ensure that some rules would be in place without undue delay to implement the statutory requirements of the 1990 amendments.

Congress contemplated that, if the agency did not issue final rules based on public comment by the specified date (H. Rept. 101–538, supra, 18), and the provisions of sections 2(b)(2), 3(b)(2), and 6(b)(3)(D) of the 1990 amendments were triggered, then the consideration of the proposed rules as final rules without notice and comment should occur and would be justified. This so-called "hammer" provision had an overriding purpose: to motivate FDA and all parties involved in these rules to resolve expeditiously the many issues raised in them, rather than become mired indefinitely in their complexity. FDA believes the hammer has fully achieved its important purpose. It has encouraged prompt resolution of outstanding issues and led to agreement on final rules that represent substantial improvement over the proposed rules and that will be in place sufficiently before the date the statute must be applied to allow full industry compliance.

There is no indication in the legislative history of the 1990 amendments that Congress intended FDA to disregard the comments that it had received on the November 27, 1991, and July 28, 1992, proposals once the "hammer" had fallen and the November 8 regulations were considered final, or that Congress intended the triggering of the mechanism in sections 2(b)(2), 3(b)(2), and 6(b)(3)(D) of the 1990 amendments to prevent FDA from putting in place final regulations based on public comments as quickly as possible. While the proposals to implement the 1990 amendments may have had the benefit of general public comment on food labeling issues, they are no substitute for final rules based on the extensive rulemaking record developed in response to those proposals. In response to the public comments on the proposals, FDA has improved the regulations in numerous respects, better achieving the goals of the 1990 amendments, to the benefit of both industry and consumers.

Revocation of the November 8 regulations will eliminate any ambiguity as to which final regulations are controlling. Thus, for the reasons set forth above, FDA believes that this revocation is fully consistent with the 1990 amendments.

This revocation is also fully consistent with the requirements of the Administrative Procedure Act. The Administrative Procedure Act provides that the agency may revoke a regulation without notice-and-comment procedures "when the agency for good cause finds (and incorporates the finding and a brief statement of reasons therefor in the rules issued) that notice and public procedure thereon are impracticable, unnecessary, or contrary to the public interest." FDA finds that there is good cause for dispensing with notice-and-comment procedures in revoking the November 8 regulations.

First, notice-and-comment rulemaking on the revocation of the November 8 regulations is impracticable. Very little time remains before the provisions added by the 1990 amendments and implemented by the November 8 regulations go into effect. The new provisions of the act on health claims are effective on May 8, 1993, without any possibility of extension. Under those provisions, foods are automatically misbranded if health claims are made on their labels that do not meet the requirements of FDA's regulations.

In the final rules published elsewhere in this issue of the **Federal Register**, FDA is exercising the statutory flexibility granted in section 10(a)(3)(B) of the 1990 amendments to extend the date on which it will apply the new provisions on nutrition labeling and nutrient content claims to May 8, 1994. Comments have shown that this additional time for compliance with the final regulations is necessary to prevent undue economic hardship to industry. Even a minimal prior notice-and-comment period on this revocation would be likely to delay issuance of any final rules for at least several months. This delay would reduce significantly the amount of time industry is permitted under the statute to come into compliance with the nutrition labeling and nutrient content claims rules. That compliance cannot begin until the final rules on which the agency intends to rely in enforcing the amendments are in place. Use of notice-and-comment procedures to revoke the November 8 regulations and to replace them with new final rules would thus risk causing the very harm Congress attempted to prevent in permitting this extension.

Secondly, engaging in notice-and-comment rulemaking on the revocation of the November 8 regulations would be contrary to the public interest. The delay caused by receiving and responding to comments on the revocation would increase confusion and could lead to substantial hardship and expense to industry, which would face the possibility of having to label its products to comply with the November 8 regulations and then having to relabel them to comply with any new final rules that the agency eventually issued after the comment period. Revoking the November 8 regulations without notice and comment allows the agency to replace them immediately with final rules based on extensive public comment and thus to provide certainty to industry as to the regulatory requirements with which it must comply.

There is a strong interest in ensuring continuity of regulation, particularly where the purpose of the regulations is to provide information to consumers that they can understand and on which they can rely. A situation in which labels appear that comply with the November 8 regulations, only to be replaced by labels that comply with any final rules that the agency might ultimately issue, would be inconsistent with this goal. Rather, it would contribute to consumer confusion, which is precisely what Congress was trying to prevent in enacting the 1990 amendments to reform the food label.

The agency's final rules implementing the 1990 amendments need to be the gold standard for the food marketplace. Based as they are on public comment, scientific evidence; and sound public policy, the final rules issued today are the culmination of the Department of Health and Human Services' efforts, begun in August 1989, and reinforced in 1990 by the Administration and Congress, to reform the food label.

Finally, it is in the public interest and consistent with the purposes of the Administrative Procedure Act to have in place as quickly as possible final rules that are the product of a full rulemaking procedure. As stated above, Congress included sections 2(b)(2), 3(b)(2), and 6(b)(3) in the 1990 amendments because of the importance of having final regulations in place implementing the 1990 amendments without undue delay. H. Rept. 101–538, supra, 18. Today's action is consistent with that goal, because final rules implementing section 403(q) and (r) will be in place. By revoking the November 8 regulations in a manner consistent with the Administrative Procedure Act, FDA is giving full recognition to the effect of sections 2(b)(2), 3(b)(2), and 6(b)(3) of the 1990 amendments. The rules that will be in place as a result of today's action have had the benefit of full public comment. Those comments established the existence of problems with the proposals, and FDA has fully addressed those problems in the final rules. (See the final rules published elsewhere in this issue of the **Federal Register**.)

Considering the factual situation as a whole, there is good cause for waiving notice and comment. FDA has been diligent in arriving at final rules. In the past year, FDA has reviewed over 40,000 comments, held three public hearings, and produced final rules in more than 20 separate proceedings. There has been full notice-and-comment rulemaking on the final rules that FDA is issuing today, and interested persons have had ample opportunity to comment on all substantive issues addressed in those rules. However, circumstances outside FDA's control prevented it from issuing those final rules by the statutory deadline. In light of this, the agency is acting responsibly and reasonably in dealing with the unique situation it faces. The agency's prompt action to withdraw the November 8 regulations is necessary to facilitate the enormous transformation of the food label that will occur over the coming months. Moreover, no hardship will result from replacing the November 8 regulations now, because not enough time has passed since November 8 to permit significant action in reliance on the November 8 regulations.

Therefore, FDA concludes that there is good cause for withdrawing the November 8 regulations without notice and comment.

Consistent with its own procedural regulations, however, FDA is providing an opportunity for comment on its decision to revoke the November 8 regulations. Under § 10.40(e)(1) (21 CFR 10.40(e)(1)), FDA may issue a regulation without notice and public procedures when the agency determines for good cause that they are impracticable, unnecessary, or contrary to the public interest. In such a situation, the FDA procedural regulations require that the notice promulgating the regulation state the reasons for the determination, and provide an opportunity for comment to determine whether the regulation should subsequently be modified or revoked. This notice complies with these procedural requirements. Given the present unique circumstances, however, FDA finds under § 10.40(b)(2) that there is good cause to limit the comment period to 30 days.

FDA also finds, based on the reasons discussed above, that there is good cause to issue this revocation effective immediately (5 U.S.C. 553(d)(3)). A delayed effective date would be contrary to the public interest in minimizing regulatory uncertainty: it would create unnecessary confusion if these rules remained in effect for 30 days after the issuance of the final rules based on notice and comment. Moreover, this revocation of regulations that are not yet effective will not impose any behavioral changes on regulated industry, unlike the promulgation of a normative rule. Thus, a delayed effective date for this final rule would be unnecessary, impracticable, and contrary to the public interest.

After carefully considering the provisions of the 1990 amendments and their legislative history, FDA believes that, in this final rule and in the other final rules published today, it has taken the appropriate steps to resolve any questions created by the hammer. FDA is taking a course that recognizes Congress' desire to have final regulations in place by November 8, 1992, but that also recognizes, as discussed above, that Congress ultimately would not want to undercut the benefits of notice-and-comment rulemaking. The agency considered various alternate courses of action but rejected them because they were inconsistent with the 1990 amendments, the amendments' legislative history, the relevant facts, or the urgency of the current situation.

One alternative would have been to propose to revoke the November 8 regulations and to propose rules to replace them. This course was rejected because it would create too much uncertainty for industry, which would then have been compelled to begin complying with section 403(r)(1)(B) of the act on May 8, 1993, and with requirements on nutrition labeling and nutrient content claims by May 8, 1994, and because this course of action gives no effect to the extensive rulemaking that FDA has conducted for the last 12 months.

A second course would have been to term the final rules published today "interim rules," with additional opportunity for comment and a commitment to publish "true" final rules based on further comment. The agency has concluded that there would be little gain from such a course. Calling the rules "interim rules" would only create confusion and could induce industry to postpone action to comply with the new regulations. Also, although the comment period on the November 27, 1991, proposals closed on February 25, 1992, FDA continued to receive and consider comments well into the early fall. FDA believes that, since that time, no new information has become available that would change the agency's regulatory approach. If such information exists, FDA's procedural regulations provide ways for bringing it to the agency's attention, e.g., a petition under 21 CFR 10.30.

A third course would be simply to leave the November 8 regulations in place. FDA has concluded that this course of action would make little sense. It would be unfair to both industry and consumers to forego promulgating the best regulations possible. The agency thus believes that, in publishing the new final rules today, it is acting in the best interests of industry and consumers.

The agency therefore urges all affected manufacturers, packers, and distributors to begin to act in accordance with the final rules published today. The agency has received numerous comments about how much work will be necessary to comply with the new regulations, and, in response, FDA is announcing elsewhere in this issue of the **Federal Register** that it is delaying until May 8, 1994, the application of section 403(q) and (r)(2) of the act. However, if there is to be compliance by the application date, work must begin now. The final rules published today establish the requirements that must be met.

III. Additional Comments

The final rules that FDA is issuing today are the product of notice-and-comment procedures, and no further such procedures are required. The Administrative Procedure Act provides for notice and opportunity for public comment on proposed agency rules to ensure meaningful public input into agency rules that affect the public. Public comment is not an end in itself. FDA believes that it has fulfilled any possible purpose of this requirement. The agency has provided three prior opportunities for public comment on food labeling reform: the 1989 advance notice of proposed rulemaking, proposed rules in 1990, and proposed rules implementing the 1990 amendments in 1991 and 1992. While additional comments are always possible, the agency believes the Administrative Procedure Act in no way requires an additional opportunity for them. Now, the public interest requires finality and expeditious actual reform of the label—to the benefit of both industry and consumers. Recognizing, however, that some people may argue that there is a technical requirement for further rulemaking procedures, FDA finds that there is also good cause to proceed without them. For the reasons discussed elsewhere in this document, and in light of the extensive rulemaking procedures that have already been followed, further notice and comment would be unnecessary, impracticable, and contrary to the public interest.

The agency firmly believes that all the final rules it is publishing today, including those superseding the November 8 regulations, are the logical outgrowth of the November 27, 1991, and July 28, 1992, proposals and are fully supported by the administrative record that has been developed. Although the agency does not believe that any public purpose would be served by reopening for further comment at this time the issues addressed in that rulemaking, FDA recognizes that in any rulemaking of this size there will be technical issues in specific provisions. Therefore, the agency is providing 30 days for comment on these final rules on such issues. FDA is not interested in receiving comments that it has already received and considered. Interested persons are urged to limit their comments to technical matters or technical unintended consequences in specific provisions if not raised in earlier comments. In order to assure consideration of any comments, interested persons must certify that their comments are so limited. Comments should be submitted to the specific docket of the final rule being commented on. If the comments identify any technical provision of the final rules that FDA agrees should be changed, FDA will take action to modify that provision. This approach will enable FDA to quickly address any unintended effects of the final rules, yet not delay the finality that FDA believes is imperative for both industry and consumers.

IV. Opportunity for Comments

Under § 10.40(e), an opportunity for comment on this final rule is being provided. Interested persons may, on or before February 5, 1993, submit to the Dockets Management Branch (address above) written comments regarding this final rule. Two copies of any comments are to be submitted, except that individuals may submit one copy. Comments are to be identified with the docket number found in brackets in the heading of this document. Received comments may be seen in the office above between 9 a.m. and 4 p.m., Monday through Friday.

Therefore, the regulations that were considered final by operation of law on November 8, 1992, as announced in the

Federal Register of November 27, 1992 (57 FR 56347), are hereby revoked.

Dated: December 17, 1992.

David A. Kessler,

Commissioner of Food and Drugs.

Louis W. Sullivan,

Secretary of Health and Human Services.

[Docket Nos. 90N–0134 et al.]

RIN 0905–AD08 and 0905–AB68

Food Labeling: Establishment of Date of Application

AGENCY: Food and Drug Administration, HHS.

ACTION: Final rule.

SUMMARY: The Food and Drug Administration (FDA) is publishing this final rule to establish May 8, 1994, as the date on which it will apply the mandatory nutrition labeling and nutrient content claims provisions of the Nutrition Labeling and Education Act of 1990 (the 1990 amendments). This action is in accordance with section 10(a)(3)(B) of the 1990 amendments which allows the Secretary (and, by delegation, FDA) to delay, for up to 1 year, the date on which FDA will apply those provisions to foods if the agency finds that compliance with the new provisions would cause "undue economic hardship."

DATES: The statutory effective date of sections 403(q) and 403(r)(2) of the Federal Food, Drug, and Cosmetic Act (the act) is May 8, 1993, except that section 403(q)(4) (raw agricultural commodities and raw fish) became effective November 8, 1991. However, FDA is delaying the date that it will apply sections 403(q) of the act (21 CFR 101.9) and 403(r)(2) of the act (21 CFR 101.13, all of the regulations in subpart D of 21 CFR part 101, and 21 CFR 130.10), except section 403(q)(4) of the act (21 CFR 101.42 through 101.45), until May 8, 1994. The effective date of the regulations published elsewhere in this issue of the **Federal Register** implementing sections 403(q) and 403(r)(2) of the act, except section 403(q)(4) of the act, is May 8, 1994.

FOR FURTHER INFORMATION CONTACT: Gerad L. McCowin, Center for Food Safety and Applied Nutrition (HFF–302), Food and Drug Administration, 200 C St. SW., Washington, DC 20204, 202–205–5267.

SUPPLEMENTARY INFORMATION:

I. Background

On November 8, 1990, the President signed into law the 1990 amendments (Pub. L. 101–535). This statute adds section 403(q) (21 U.S.C. 343(q)), which makes nutrition labeling mandatory for all food, and section 403(r)(2) (21 U.S.C. 343(r)(2)), which gives FDA authority to define nutrient content claims, among other sections, to the act.

In accordance with the 1990 amendments, FDA published proposed rules on November 27, 1991, to implement these sections of the act. Under section 2(b)(1) of the 1990 amendments (21 U.S.C. 343 note), FDA is to adopt final regulations by November 8, 1992. If the agency fails to do so, under section 2(b)(2) of the 1990 amendments, the proposed rules are to be considered final rules. Under section 10(a)(1)(A) and (B) of the 1990 amendments (21 U.S.C. 343 note), sections 403(q) and 403(r)(2) of the act are effective 6 months after the promulgation of the final regulations or after the proposed regulations are considered to be final regulations. Thus, by statute, sections 403(q) and 403(r)(2) of the act will become effective no later than May 8, 1993.

However, section 10(a) of the 1990 amendments provides that if the Secretary of Health and Human Services and, by delegation, FDA "* * * find that compliance with sections 403(q) and 403(r)(2) of such Act would cause an undue economic hardship, the Secretary may delay the application of such sections for no more than one year." In its regulatory impact analysis (RIA) published in the **Federal Register** of November 27, 1991 (56 FR 60856), FDA tentatively found that compliance with the 1990 amendments by May 8, 1993, will cost $1.5 billion, and that 6-month and 1-year extensions of the compliance date would result in significant reductions in those costs. Therefore, given the extent of these costs, FDA felt that the possibility of "undue economic hardship" was raised. The agency consequently requested comments on the meaning of "undue economic hardship," and on whether a delay in the application of sections 403(q) and 403(r)(2) of the act was appropriate. The agency also requested comments on whether a determination of "undue economic hardship" should be based on aggregate costs to industry generally, on industry-by-industry costs, or on firm-by-firm costs.

Interested persons were given until February 25, 1992, to comment. FDA received comments from government organizations, retailers, consumer groups, State groups, and private organizations. A discussion of the agency's decision, and a summary of the comments and the agency responses, follow.

II. Undue Economic Hardship

The 1990 amendments provide that the Secretary may delay the application of sections 403(q) and 403(r)(2) of the act for up to 1 year if he "* * * finds that compliance with [either section] would cause an undue economic hardship." There is no relevant legislative history on this provision. Clearly, however, Congress foresaw that there would be a significant cost to complying with these sections of the act. Its use of the phrase "undue economic hardship" implies that Congress recognized that some economic hardship may result from efforts to comply with the 1990 amendments. The question is whether that cost is so great as to constitute "undue" economic hardship.

"Undue" is defined as "exceeding what is appropriate or normal," "excessive," or "not just [or] proper." Synonyms include inequitable, inappropriate, extreme, and immoderate. As yet, no court has construed the meaning of the 1990 amendments; however, parallels may be drawn with cases discussing similar language. Cases involving an employer's accommodation of an employee's religious practices have looked for a simple increase in costs in assessing whether the accommodation created an "undue hardship" for the employer. See *Transworld Airlines* v. *Hardison*, 432 U.S. 63, 84 (1977) (more than a de minimis cost to employer is an undue hardship); *State Division of Human Rights* v. *Carnation Co.*, 366 N.E.2d 869, 870 (N.Y. Ct. App. 1977) (a palpable or significant increase in costs is enough to establish undue hardship; threat to economic stability of enterprise is not required). In determining whether a punitive damage award was "excessive," a court looked at whether it was "out of all proportion to the defendant's financial position." *T.D.S., Inc.* v. *Shelby Mutual Insurance Co.*, 760 F.2d 1520 (11th Cir. 1985). Where a company was ordered to reopen a plant after closing it discriminatorily, the remedy was to be upheld unless the company could show an undue economic burden, which was interpreted as a "substantial outlay of new capital or [other] undue financial hardship." *Teamsters Local Union N. 171* v. *NLRB*, 863 F.2d 946 (D.C. Cir. 1988), cert. denied, 490 U.S. 1065 (1989). In a case involving the Pension Benefit Guaranty Corporation's (PBGC's) authority to grant waivers under the Employee Retirement Income Security Act (ERISA) when an employer faced "unreasonable hardship," a court upheld the PBGC's denial of a waiver where the PBGC had considered only unusual, substantial economic hardship. *A–T–O, Inc.* v. *Pension Benefit Guaranty*

Corporation, 634 F.2d 1013 (6th Cir. 1980). According to the court, the waiver provision was Congress' way of dealing with unforeseeable, unexpected situations of serious employer hardship. Id., 1023.

It appears from these cases that an undue economic hardship must entail at least an increase in costs and at most an unusual and substantial economic burden. Given Congress' implicit assumption that compliance with the 1990 amendments would involve an economic burden, the agency believes that the best interpretation of Congress' intent would require that an undue economic hardship be a substantial economic burden, in excess of what Congress would have envisioned, although not necessarily threatening the viability of a company, attributable to the 6-month compliance date established by the 1990 amendments.

1. The comments that the agency received were generally consistent with this view of what constitutes undue economic hardship. A comment from a trade group stated that "undue economic hardship" should be defined by the lost product lines and businesses that will occur as a result of a short compliance time. Another comment defined "undue economic hardship" as any increase in costs of goods to consumers in the current economic climate. A large company stated that undue economic hardship was shown where there were large costs "without appreciable benefit."

The agency agrees with the comments that a large increase in industry's costs attributable to the application of sections 403(q) and 403(r)(2) of the act 6 months from November 8, 1992, would provide evidence of undue economic hardship if that increase is more than what was likely to have been envisioned by Congress. However, a simple increase in costs alone is insufficient to demonstrate such hardship because Congress envisioned that there would be some economic burden to industry when it passed the 1990 amendments.

2. One comment from a consumer group argued that industry will not experience undue economic hardship. The comment stated that: (1) There is no undue burden on industry because consumers would bear the costs, not industry; and (2) since the public at large would be the recipients of the benefits of labeling, and the benefits outweigh the costs, the public should be willing to bear the costs.

The agency disagrees with the first point. It is likely that much of the costs of nutrition labeling will not be passed on to consumers, although the agency is not in a position to estimate exactly how much of the amount will be passed on to consumers. Because the costs per product are primarily fixed costs, it is likely that manufacturers with low volume products, which constitute 80 percent of all products, with higher per product costs will not be able to pass these costs on if they are in competition with high volume products.

The agency agrees that the public at large will be the recipient of the benefits of nutrition labeling. However, because it is likely that many manufacturers will not be able to pass the costs on, and because the agency received no information with which to estimate the amount that can be passed on, the agency is not persuaded by this argument.

3. Several comments suggested that "undue economic hardship" should be based on a cost-benefit analysis. Both industry and consumer groups provided their views that benefits should be balanced against the costs of implementing the labeling provisions. Industry groups generally found the costs to be disproportionate to the benefits, while consumer groups commented that the potential health benefits far exceeded the cost to industry.

The agency finds that there is no basis in the statute, the legislative history, or the case law to find that the assessment of undue economic hardship entails a balancing of the costs and benefits of a delayed application date. In fact, it can reasonably be inferred from the 1990 amendments that Congress balanced the competing interests in framing the statute and provided in section 10(a)(3)(B) of the 1990 amendments that should the economic burden imposed by meeting the statutory compliance date be greater than reasonable, FDA is authorized to grant relief to affected industry. The court held in *A–T–O, Inc.* v. *PBGC*, that Congress, before enacting the ERISA statute, engaged in just such a "finely tuned balance between protecting pension benefits for employees while limiting the cost to employers." *A–T–O*, 634 F.2d at 1021. In enacting ERISA, as in the passage of the 1990 amendments, Congress could not foresee all possible situations of undue economic hardship, so it granted discretion to the administrative agencies to determine the circumstances in which undue economic hardship exists. Id., 1023.

III. How to Assess Whether There is Undue Economic Hardship

In its November 1991 RIA, the agency requested comments on whether it should assess undue economic hardship on a firm-by-firm, industry-by-industry, or on an aggregate basis.

4. Several comments argued that because FDA can expect requests for extension from most of the industry regulated by FDA as well as from many foreign firms, it would be difficult, if not impossible, for FDA to grant extensions on a firm-by-firm basis. Some comments stated that company-specific extensions would give some firms an unfair competitive advantage based solely on production and inventory schedules and would create consumer confusion. One comment stated that a firm-by-firm approach would not adequately judge economic hardship since many firms manufacture products that overlap different industries and, therefore, have different costs. Another comment appeared to advocate use of the firm-by-firm basis because it was seeking relief for itself.

In addition, one consumer advocate organization preferred that FDA assess undue economic hardship on a case-by-case basis. However, if this would be too burdensome, the comment suggested that FDA consider granting extensions by categories of firms, based on size or labeling capacity. Several other comments voiced similar requests by suggesting that if FDA does not determine the aggregate economic impact to be undue, then it should consider whether the impact is particularly burdensome to specific industries. Several comments, including two from governmental units, suggested that if FDA does not delay the application of sections 403(q) and 403(r)(2) of the act for all manufacturers subject to the 1990 amendments, FDA should consider applying a later date for small business. Other comments suggested that the industry-by-industry approach would create competitiveness problems and would be extremely difficult to apply fairly. The majority of comments expressed the opinion that undue economic hardship should be determined on an aggregate basis because it would be the only equitable and practical approach. The one consumer group that argued against an extension agreed that FDA should consider undue economic hardship on an aggregate basis.

FDA believes that it should determine whether there is undue economic hardship for the food industry as a whole. Because there are approximately 17,000 U.S. food companies in the portion of the food industry regulated by FDA, as well as a large number of foreign food manufacturers, it would be administratively infeasible for FDA to grant extensions on a firm-by-firm basis because the agency does not have the

resources to process and act on petitions. Similarly, the agency also is persuaded by the evidence provided by the comments that granting extensions on an industry-by-industry basis would be perceived as arbitrary because it would be extremely difficult to distinguish among industries on the basis of the costs that would have to be borne if there is early application of sections 403(q) and 403(r)(2) of the act. The overwhelming majority of comments provided evidence that such costs will have to be borne by most companies.

Moreover, from a compliance standpoint, FDA's job would be made more difficult if a delay was granted on other than an industry-wide basis. In such a situation, compliance checks would require not merely looking at the label but at whether the labeling requirement applied to the particular firm or segment of the industry. Therefore, FDA has decided to define "undue economic hardship" on an aggregate basis.

IV. Evidence of Hardship

A. General

In conformity with the case law cited above, the agency has interpreted the undue economic hardship standard to require a determination as to whether the costs of complying with sections 403(q) and 403(r)(2) of the act by May 8, 1993, impose an unexpected and excessive burden on industry. It is the costs that exceed the costs of implementing sections 403(q) and 403(r)(2) of the act that can reasonably be said to have been foreseeable that FDA has looked to in deciding whether there is undue economic hardship.

FDA has sought to determine the amount of those foreseeable costs even though the legislative history does not provide any explicit estimates of what Congress expected the costs of implementing sections 403(q) and 403(r)(2) of the act to be. However, the agency notes that Congress acted after FDA proposed to require nutrition labeling on food products in the **Federal Register** of July 19, 1990 (55 FR 29487). FDA's proposal contained a preliminary cost assessment of $315 million for implementation of the nutrition labeling proposals. Although this estimate was very rough and based on preliminary figures, and although there are differences between the agency's July 19, 1990, proposal and the 1990 amendments, Congress apparently was aware of, and may well have considered, FDA's estimate in considering the 1990 amendments (see H. Rept. 101–538, 101st Cong., 2d sess. 9 (1990)).

The agency now estimates the cost of implementation of all label changes required by the 1990 amendments to be $1.5 billion if the date of application of the nutrition labeling and nutrient content claims provisions is not delayed beyond May 8, 1993. Therefore, if $315 million is used as a baseline, the current estimated cost to industry of implementing sections 403(q) and 403(r)(2) of the act approximately quadruples it. In the RIA in which the 1990 estimate was calculated, for those costs that FDA did not have information to calculate, FDA stated that it was plausible that they would be considerable, but the agency was not specific as to exactly how large they could be. Therefore, the 1991 estimate, published in the **Federal Register** of November 27, 1991, as part of the RIA (56 FR 60856), can be considered unexpected and greatly increased because the available public data in July 1990, 4 months before the passage of the 1990 amendments, did not predict costs in that range. The 1991 estimate was based in large measure on data developed by FDA in interviews with food manufacturers and in a mailed survey that were conducted after July 1990.

Consequently, the agency concludes that the food industry will have significantly higher costs than could have been anticipated from the estimates and data at the time of passage of the 1990 amendments. The majority of comments that the agency received in response to its November 1991 RIA support the agency's cost estimates and demonstrate that there are substantial additional costs that result from a 6-month (November 1992 to May 1993), rather than a 1-year, 15-month, or 18-month, compliance date. These comments and the agency's responses are discussed in the section that follows.

B. Costs of Compliance with Section 403(q) of the Act

Having defined the term "undue economic hardship," the agency has considered whether compliance with section 403(q) of the act would cause an undue economic hardship for the affected industry. The comments received from industry overwhelmingly expressed concern regarding, and provided evidence of, such hardship.

5. Many comments stated that the cost of analytical testing for nutritional composition of products will be burdensome to meet within the proposed timeframe of May 8, 1993, especially for small companies that cannot afford the testing and that do not have their own laboratories to perform the nutritional analysis. Many of these comments stated that the increased demand for testing services would lead to increased costs for testing, which would burden all firms but especially smaller firms. The comments stated that as firms compete for laboratory services, preferred treatment will be given to the larger firms that can better afford these additional costs, thus exacerbating the competitive advantage of larger firms. One trade association estimated the average cost per product for nutrition testing to be $1,433 for small firms and between $627 and $864 for larger companies. Other comments provided estimates for the costs that ranged from $400 to $2,600 per product.

Based on the data developed by the agency in producing its November 1991 RIA, the agency believes that the estimates provided by these comments are accurate and thus finds that a short compliance period will increase the cost to firms of analytical testing. Food manufacturers will have to compete for position in the queue and to pay queuing costs to improve their position in line. In that RIA, FDA determined that 40 percent of the packaged food products covered by the labeling amendments are currently labeled and have undergone some analytical testing. The agency estimated the average cost per product to bring the product into compliance for products already nutritionally labeled to be $750, and for those not already so labeled, the agency estimated a cost of $1,785 per product (56 FR 50856 at 50864). Because less than half of all products have been tested, and because once the regulations become final, all firms will require at least some testing, the demand for laboratory services will more than double as a result of labeling regulations. The prices of these services will consequently increase substantially in the shortrun. However, because laboratory capacity is expected to increase based on an increase in long-term demand, FDA cannot predict the final price for these services. It is clear, however, that the increase in costs will be greatly mitigated by a delay in the date of compliance. Such a delay will reduce the pressure on the supply of these services because not all firms will test products at the same time, and therefore, a delay will mitigate the increase in prices for laboratory services.

6. Comments from small companies stated that the cost of laboratory testing could be reduced greatly by the use of nutrition data bases instead of requiring laboratory analyses of their products. One comment from a data base supplier

stated that a small data base product that could cover several products would sell for $1,000 to $2,000 and would last for several years--significantly cheaper than analytical tests, estimated in the November 1991 RIA at $723 to $1,785 per product.

The agency agrees with the comments. Nutrition data bases are currently under development throughout the food industry, particularly by large companies. There is no discussion of use of analytical data bases in the legislative history of the 1990 amendments, however, so Congress must have been unaware of the significant cost savings that these data bases would guarantee. The lack of data bases contributes to the costs of compliance, and a short compliance period limits the possibility of using data bases to mitigate costs. The agency has been informed that these data bases will not be operational in time to meet the May 8, 1993, deadline. To date, FDA has not approved any nutritional data bases for use in nutrition labeling. Many of those commenting, particularly small companies, requested at least a year beyond May 8, 1993, to develop and use these data bases. Assuming FDA will approve nutritional data bases, an extension will thus help in getting more data bases developed, approved by FDA, and in use by the food industry.

7. Some firms expressed concern that the capacity of analytical laboratories will be insufficient to provide all of the food testing needed by the 17,000 U.S. companies in the food industry by the 6-month effective date.

FDA does not have any data, nor was any submitted, on the number of laboratories equipped to perform nutrition analyses. FDA also does not know how many companies have inhouse facilities. However, a comment from an independent laboratory stated that it is increasing its capacity to meet "the huge surge of work brought about by the FDA mandatory labeling." Firms will continue to need to have their products tested as they reformulate their products or develop new ones. Also, firms will periodically retest their products to verify the information. The agency, therefore, anticipates that laboratory capacity will expand to meet this sustained demand. Thus, FDA does not believe that there will be undue economic costs associated with laboratory capacity.

8. Many firms expressed concern that labels could not be redesigned and printed on time to meet the statutory deadline of May 8, 1993, across the food industry because label designers and suppliers have stated that they do not have the capacity to handle the volume of business that will be generated as a result of the regulations. The comments stated that there is little incentive for printing and packaging firms to make capital improvements to meet the excess demand. The cost of capital improvements is high, and unlike the demand for analytic testing which will continue in the future, the demand for label printing is essentially a one-time label change for the entire industry. One firm estimated the cost to label printers for relabeling equipment to be $11,000 if compliance is required by May 8, 1993, with that cost dropping to $8,000 if compliance is delayed for 1 year. The comments suggested that the same scenario applies to printing capacity, whether inhouse printing or by contract. In some cases, if demand is high enough for a short compliance period, new equipment could be used which would result in excess printing capacity in the future. The comments pointed out that an additional problem with the earlier compliance date is the inability of some label suppliers to purchase and install new equipment and to find new personnel to operate such equipment within the established timeframe.

Packaging suppliers and label printers estimated that it would take between 2 to 5 months per label for redesign and printing. The comment said that time needed for other tasks, such as analytical testing, label approval, and distribution, would add considerable time to this estimate. Several comments stated that between one-third and one-half of all relabeling could be completed by May 1993, and that approximately two-thirds could be completed by November 1993. The agency also received a comment from a label printer who services 14,000 labels that stated that the company anticipates that the time that it will take it to do a job will double. Based on its present resources, the comment stated that even with a doubling of its capacity achieved by hiring new personnel, they will be almost 54 percent short of the estimated label changes needed by its customers.

FDA believes that redesign and printing of the food label to accommodate the new requirements of the 1990 amendments are compliance costs. FDA agrees that many firms may have difficulty relabeling their products in the 6-month compliance period in the statute. Because there is little incentive to increase printing capacity given the one-time nature of much of what needs to be done to print new labels, the agency does not anticipate additional printers entering the market to relieve the shortage. Because Congress did not have available to it printing cost differentials associated with different compliance periods, these costs may be construed as unexpected and undue.

9. Some firms commented that the costs of label inventory disposal would be great. According to the comments, small companies in particular carry large inventories of labels and will have a disproportionately large cost if forced to dispose of those inventories. One small firm stated that it would have to destroy 2 years worth of label inventory. In addition, specialty firms (e.g., manufacturers of gourmet products) noted that they have a large number of individual labels and a low volume of individual unit sales, which results in a large inventory of labels. Firms reported a cost of inventory disposal ranging from $79,000 to $3,603,000 for a May 1993 effective date and $0 to $227,000 for an extension to May 1994. Only one large food manufacturer provided an estimate of the cost of inventory disposal (i.e., approximately $800,000) for a compliance period ending in November 1993. One industry association representing supplement manufacturers estimated the cost of disposal for a November 1993 compliance date at $15 million. Another industry association, after conducting a survey of its members, stated that 37 member companies reported a total inventory disposal cost of $26 million and 1.5 billion labels for a compliance date of May 8, 1993. According to the comment, the cost to these 37 firms would decline to $2 million and 150 million labels with a 1-year extension.

In addition, several comments stated that another label disposal problem involves production of private labels for retail grocery and other companies. Typically, the manufacturer provides the art work and printing plates for private label customers. When orders for products are below normal, the manufacturer stores the packaging material at his cost. The comments stated that the new labeling changes will necessitate modification of all customer labels at the manufacturer's expense, and the manufacturer may have to write off as a loss considerable quantities of label and packaging material.

These figures do not conflict with those estimated by FDA in its November 1991 RIA. Based on a contractor's study of the food processing industry, FDA estimated the cost of disposal of remaining inventory to be $306 million. Although conducted before passage of the 1990 amendments, the information generated from this study was not available to Congress or to the public.

In the 1990 estimate, FDA assumed that 1 year was sufficient to dispose of all labels and thus did not estimate cost

of label disposal. Because the 1990 estimate was apparently the only information Congress had available to it, it may be presumed that these costs were unforeseen and, hence, are in excess of those anticipated by Congress.

10. Some small firms stated that the implementation of the nutrition labeling provisions would drive them out of business because the cost of compliance would eliminate their already low profit margins. These small firms claim that they cannot absorb costs, and relabeling will prevent their prices from being competitive.

FDA is aware that firms with low profit margins may be significantly affected by their effort to come into compliance with section 403(q) of the act. Although section 403(q) of the act includes a small business exemption, many small firms do not meet the requisite levels. Extending the date of application will help alleviate the impact on small businesses by mitigating increases in the cost of analytical, redesign, and printing services, and by reducing the amount of label inventory destroyed. Also, an extension will assist those firms forced to scale back or halt operations because they are unable to produce complying labels in a timely manner.

11. Comments from specialty food distributors noted that the cost of relabeling to be in compliance with section 403(q) of the act could result in the elimination of profitable product lines when the manufacturer decides that the unit cost of the labeling does not justify compliance or may trigger a price increase.

FDA agrees that some profitable product lines have such small profit margins that it is not unreasonable to expect that the cost associated with a short compliance period might increase the cost of manufacturing such that the product line is no longer profitable. The agency is currently exploring the possibility of legislation to relieve this undue hardship on small firms.

12. A European Community (EC) Commission expressed concern that overseas suppliers will be unable to meet the 6-month, May 8, 1993, deadline because of differences in definitions and analytical procedures between EC and the United States. The comment noted that the 6-month effective date would be impossible for EC producers to meet because there is a delay of several months between the labeling of products in Europe and their arrival in the United States because of travel time and customs formalities, giving overseas suppliers effectively only 3 months to analyze and relabel their products. Additionally, a trade association for herbal products confirmed that printing and analysis of the product for overseas suppliers would have to be accomplished in 3 months.

FDA agrees that foreign food manufacturers might need a longer compliance period than domestic manufacturers because of the differences in language, analytical methodology, and length of time it takes to transport the product. FDA believes the longer compliance period specified in this final rule will alleviate the concerns expressed by the comment. The agency notes that all products introduced into interstate commerce on or after May 8, 1994, must comply with sections 403(q) (except section 403(q)(4)) and 403(r)(2) and any final regulations promulgated to implement those sections.

13. A comment from a trade group for the sugar manufacturers pointed out that because in their industry the label is the package, the product cannot be packaged until it can be labeled. These manufacturers expressed concern that a substantial amount of sugar inventory will be misbranded and unmarketable, thus causing sugar to be destroyed or returned, opened, poured out, and reprocessed to be finally placed in packages conforming to label requirements. One sugar company estimated its cost of process and inherent losses to be $3.6 million.

As previously stated, FDA believes the longer compliance period specified in this final rule will alleviate the concerns expressed by the comment. Again, the agency notes that these manufacturers will have until May 8, 1994, to use up their inventory. They will also have ample time to develop their new packaging.

14. One trade association commented that their business was, in large part, seasonally based because of the holiday trade, such as Halloween, and that other businesses had special holiday or seasonal considerations. The comments noted that seasonal products need unusually long advance planning. Graphics and packaging must be finalized and ordered 9 months to 1 year in advance. The comment argued that label changes would occur in the middle of the packaging and shipping season for products that represent 20 percent of some of their members' product lines.

The agency agrees that the 6-month effective date might be impossible for some seasonal products and could result in some product lines being dropped. The agency believes that the loss of product lines would be an undue economic cost. The agency notes that a delay of applicability of section 403(q) of the act of approximately 15 total months will, according to the comments, be sufficient lead time for these products.

15. Some comments requested an extension of the date of application of the labeling provisions because initial analytical results might induce companies to reformulate their products in order to improve the nutritional composition of those products to appeal to the public. An industry association stated that the costs of reformulating products would be substantial--$20,000 per product. Another firm estimated the cost of reformulation to be $60,000 per item plus $400,000 to convert processing time to include controls.

The agency notes that one of the purposes of the 1990 amendments was precisely to encourage manufacturers to produce healthier products as a result of mandatory disclosure of food content. Reformulation, however, does not constitute undue economic hardship in itself because the industry is not required by statute to reformulate its products.

16. Several comments stated that the reduction in total costs that would result from a delay in the application of section 403(q) of the act would justify an extension. One comment from a major industry association stated that the total cost of food labeling would be reduced from $3.36 billion for the May 8, 1993, compliance date to $1.69 billion for a November 8, 1993, compliance date, and ultimately to $974 million for a May 8, 1994, compliance date. Another industry association stated that the total costs to its members would be reduced from $4.3 million to $900,000 if the compliance period were extended an additional year to May 1994. One large firm stated that total costs would be $251,146,000 for a May 1993, compliance date. Additionally, an industry association estimated that an extension from May 1993 to May 1994 would reduce total costs for its members from $160 million to one-tenth of that amount. Other firms stated their total costs would be reduced by 30 to 90 percent with a 1-year extension.

FDA finds that these comments are generally consistent with its own estimates. The agency estimates that the benefits of nutrition labeling and nutrient content revision will remain nearly the same ($3.6 to $3.4 billion) over the 1-year period from May 8, 1993 to May 8, 1994, while costs will decrease dramatically. In the November 1991 RIA, the agency estimated that a 6-month delay of the date of applicability would result in a savings of $600 million, a 9-month delay, $700 million

savings, and a 1-year delay, $835 million. As discussed in the final RIA published elsewhere in this issue of the Federal Register, FDA has found it appropriate to adjust these cost estimates upward somewhat.

C. Whether a Delay in Application of 403(q) of the Act is Appropriate

17. One comment from a consumer group favored no delay in applying section 403(q) of the act primarily because it wanted consumers to obtain health benefits as soon as possible from the mandatory disclosure of nutrients on food labels. A few comments tentatively favored an extension, but only if the food industry makes a strong case for undue economic hardship and provides substantial evidence of such hardship.

FDA has reviewed these comments and rejects the position that no extension of the May 8, 1993, deadline should be granted. FDA realizes that providing for early compliance with the 1990 amendments is desirable and follows the intent of Congress to implement promptly the provisions of section 403(q) of the act. However, the agency cannot ignore the evidence of undue economic hardship presented by industry comments and supported by FDA's own cost estimate. This hardship is particularly acute for small and medium-sized firms which will not be able to afford the analytical testing, printing, and inventory disposal costs if section 403(q) of the act is applied on May 8, 1993. Congress specifically provided that the Secretary may grant a delay of section 403(q) of the act of up to 1 year if such undue economic hardship is found.

Given the fact that a delay of the date of applicability for section 403(q) of the act will result in substantial cost reductions, and the evidence presented above that the costs of analytical testing, label printing, and inventory disposal far exceed the apparent expectations of Congress, a May 8, 1993, compliance date will generate a substantial economic burden. Therefore, the agency has decided that undue economic hardship will result from implementation of section 403(q) of the act on May 8, 1993, and has decided to delay the date of application of section 403(q), except for section 403(q)(4) (raw agricultural commodities and raw fish) which became effective November 8, 1991, as provided in section 403(q)(4)(B)(i).

D. Undue Economic Hardship from Application of Section 403(r)(2) of the Act

The agency also is authorized by the 1990 amendments to consider whether compliance with section 403(r)(2) of the act on May 8, 1993, will cause an undue economic hardship. Very few comments directly addressed the issue of undue economic hardship resulting from compliance with this section. Most comments did not distinguish between the two sections.

18. One comment from a consumer advocacy group stated that, because FDA's original estimates of the costs to restaurants represent roughly one percent of that industry's output, the economic burden to the food service industry cannot be deemed undue.

The agency disagrees with the comment. In its original assessment of the costs of food labeling (July 1990), FDA did not consider the costs to restaurants. Therefore, Congress had no information regarding the expense that would be incurred by restaurants as a result of the 1990 amendments. While no restaurant associations requested a delay of application of section 403(r)(2) of the act, according to a study conducted by the National Restaurant Association in a special analysis of their 1991 menu collection submitted in response to the November 1991 RIA, 89 percent of all menus would need to be changed to comply with the requirements of section 403(r)(2). While FDA is not including menus in the regulatory purview of this action, it is including restaurant signs and placards. Because this material is clearly reflective of the menu, much of it will have to be modified in response to the new law at significant cost. Thus, by any reasonable estimate, this figure is more than Congress could have envisioned and provides evidence of undue economic hardship.

The agency has decided not to undercut the relief that it is granting in delaying the application of section 403(q) of the act by forcing industry to comply with section 403(r)(2) of the act on May 8, 1993. The agency has considered that if a delay were granted in the application of section 403(q) of the act, but not in the application of section 403(r)(2) of the act, a substantial number of firms would still have to relabel their products to at least remove claims that are not in compliance with, or are not defined in, the regulations that FDA is issuing under section 403(r)(2).

The agency also notes that in section 10(a)(1)(B)(ii) of the 1990 amendments, Congress provided that persons who use a brand name that includes a term that is defined in section 403(r)(2)(A)(i) of the act have an additional 6 months, until November 8, 1993, to comply. FDA believes that the terms defined under section 403(r)(2)(A)(i) of the act will be most useful to consumers if they come onto the market at the same time. Therefore, FDA believes that an across the board delay in the application of section 403(r)(2) of the act for at least 6 months is appropriate.

E. Agency Finding of Undue Economic Hardship

The agency has considered the comments, relevant case law, and its November 1991 RIA, to determine whether undue economic hardship exists in implementing sections 403(q) and 403(r)(2) of the act by May 8, 1993. Having defined "undue economic hardship" above as a substantial economic burden in excess of what Congress would have envisioned attributable to the 6-month compliance date established by the 1990 amendments, the agency has examined the evidence presented and concludes the following:

The evidence from the comments demonstrates that undue economic hardship will occur in the aggregate because of increased analytical testing costs and pressures on printer capacity. Congress presumably was not aware that printing costs varied with different compliance periods. Therefore, a significant percentage of printing costs are unexpected costs. An estimate of label inventory disposal costs of $306 million was also not available to Congress. These costs have the greatest effect on small firms, which have low profit margins and which normally retain higher inventories of labels.

Consistent with agency figures, the comments demonstrate that the magnitude of the nutrition labeling costs are 4 times that which was reasonably expected by Congress. Additionally, these costs decrease dramatically with a 6-month, 9-month, or 12-month delay of the nutrition labeling and nutrient content provisions. Thus, the costs of applying sections 403(q) and 403(r)(2) of the act on May 8, 1993, are unnecessary and unexpected and constitute undue economic hardship for affected industry. Therefore, the agency concludes that there is an appropriate basis to delay the application of these sections.

V. How Long Should Application of Sections 403(q) and 403(r)(2) of the Act be Delayed?

Having concluded that there will be undue economic hardship to the food

industry if it is forced to comply with sections 403(q) and 403(r)(2) of the act on May 8, 1993, and that some delay is appropriate, the agency has considered how long to delay the application of these sections. Section 10(b)(3)(A) of the 1990 amendments permits the agency to delay the application of these sections for up to 1 year.

In deciding on the length of the delay, the agency notes that several factors are relevant. First, Congress has passed a second law that will require a change in food labels. The American Technology Preeminence Act of 1991 (Pub. L. 102–245) (amended in Pub. L. 102–329 (hereinafter referred to as "the metric amendments") which amended the Fair Packaging and Labeling Act (the FPLA), requires that manufacturers revise their labels and labeling by February 14, 1994, to declare net weight declarations in both the customary unit/pound system of measure and the International System of Units metric system on food labels. Second, as a result of circumstances beyond FDA's control, the issuance of the final regulations with which industry will have to comply was delayed by slightly more than a month. Both of these factors must be considered in deciding on an appropriate applicability date.

19. The agency received several comments related to the metric amendments, requesting that the agency apply sections 403(q) and 403(r)(2) of the act on the same date as the metric amendments in order to avoid a costly relabeling. One comment argued that the date of application of the nutrition labeling and nutrient content revisions and the effective date of the metric amendments should be May 8, 1994, while another comment requested simultaneous implementation on November 8, 1994, or May 8, 1995.

FDA agrees with the comments that it would be desirable if the date of application of sections 403(q) and 403(r)(2) of the act and the effective date of the metric amendments were the same. Section 107(b) of the metric amendments requires that the metric provisions take effect 2 years after the date of enactment of the act which will occur on February 14, 1994. While section 10(a)(3)(B) of the 1990 amendments provides for a delay of the date of application of sections 403(q) and 403(r)(2) of the act, the metric amendments contain no such provision.

Initially, FDA intended to make the regulations issued under section 403(q) and (r)(2) of the act effective on February 14, 1994, providing a 9-month extension and enabling manufacturers to coordinate their compliance with both laws. However, as stated above, events beyond the agency's control have led to a delay in the publication of these final regulations. Therefore, requiring compliance with the regulations implementing section 403(q) and (r)(2) of the act by February 14, 1994, would not provide industry with sufficient relief from undue economic hardship. The agency has thus decided that it is appropriate for those regulations to go into effect May 8, 1994. The resulting period provided to industry to comply with the regulations is in the range of the 15-month compliance period that the agency had earlier contemplated providing.

FDA recognizes that the metric amendments will take effect February 14, 1994. FDA encourages those firms that are able to consolidate their relabeling efforts and comply with both the metric amendments and the 1990 amendments by February 14, 1994, to do so. Moreover, FDA notes that under the metric amendments, firms are free to use up their existing label stocks before they are required to comply with the new provision. Thus, FDA is unlikely to bring an action against a product because it fails to comply with the metric amendments until after May 8, 1994.

20. Several comments favored the 6-month delay option because most of the cost burden will be alleviated by a delay of that length. The comments argued that a 6-month delay will have the effect of reducing the demand for printers, thereby causing a substantial decrease in printing costs. They also pointed out that inventory disposal costs will be significantly reduced because firms would be given additional time to use up old labels.

While the 6-month option relieves much of the economic hardship on industry by reducing the cost of labeling from $1.5 billion dollars to $800 million, the agency has rejected this option because it would leave firms in the position of having to make a second relabeling within 3 months to comply with the metric amendments. The agency has always sought to minimize the cost of relabeling. Furthermore, both seasonal products and products from other countries would have particular problems with only a 1-year compliance period which includes a 6-month delay in application of sections 403(q) and 403(r)(2) of the act.

21. Some comments suggested a phasein date of applicability over a longer period such as 18 to 24 months. One comment requested a period of trial application of the proposed regulations followed by a 90-day period for comment.

The agency rejects these comments because the 1990 amendments make no provision for such a trial period or for a longer than 1-year delay in application. Additionally, such a phasein period would be extremely difficult for FDA to administer because it does not have the personnel to ensure compliance with an application date that, as it is phased in, affects only some firms or products. Thus, the agency finds no basis to adopt the approach suggested by this comment.

22. One comment from a consumer favored a 2-year delay because the consumer believed that the costs of compliance by the May 8, 1993, deadline would be excessive ($10 billion), and that most of this added cost would be passed on to consumers. Several industry comments also requested a 2-year delay because of the cost of making label changes to meet the May 8, 1994, date.

The agency estimated in the November 1991 RIA that the cost of compliance with the 1990 amendments would be $1.5 billion. While some industry comments assert that the cost would be as high as $3 to $4 billion, there simply is no basis to find, as the comment suggests, that the cost of relabeling would be $10 billion. More importantly, a 2-year delay in the application of sections 403(q) and 403(r)(2) of the act cannot be granted because section 10(a)(3)(b) of the 1990 amendments authorizes a delay of no more than 1 year.

23. An ice cream manufacturer requested that FDA defer the date of applicability of the 1990 amendments to ice cream products until 12 months after the agency takes final action on the International Ice Cream Association's petition to establish specific standards for modified ice cream.

The agency disagrees with this comment. First, the agency does not have legal authority to grant the relief requested. As discussed above, the act grants the agency authority to delay application of sections 403(q) and 403(r)(2) of the act for 1 year from their effective date, not for a 1-year period from any particular date in the future. Secondly, the agency cannot presume that it will grant the petition in question. Even if it does, however, the modified ice cream products in question will be new foods. Thus, the costs involved in labeling these products will be the costs attributable to starting a new product line, and not costs attributable to the changes imposed by the act. Therefore, FDA finds no basis to grant the requested delay.

24. Two comments from food manufacturers stated that if the date of

applicability is delayed, two relabelings will occur because the ingredient labeling rules are statutorily mandated to take effect on May 8, 1993.

FDA finds no merit to these comments. By delaying the application of sections 403(q) and 403(r)(2) of the act until February 1994, FDA is not requiring firms to delay relabeling until that date. Quite the contrary, FDA urges firms to relabel their products as quickly as possible. However, FDA has no authority to delay the effect of the ingredient labeling provisions. Thus, whether a firm that must make labeling changes to comply with the ingredient labeling provisions makes all its changes at that time, or decides to take advantage in the delay of applicability and thus has two relabelings, is up to the firm.

25. The overwhelming majority of comments supported a delay of the date of applicability for the full 1 year for sections 403(q) and 403(r)(2) of the act. The primary reasons for these requests were that a 1-year delay is necessary to give printers time to meet the excess demand for labels imposed by the nutrition labeling provisions, and that printing and analytical testing costs, prohibitive in a short compliance period, would be reduced to more reasonable levels.

The agency agrees with these comments that a delay of the date of application of sections 403(q) and 403(r)(2) of the act will alleviate the undue economic hardship for the industry. As discussed above, FDA had intended to provide a 9-month extension to February 14, 1994, but considers that an extension to May 8, 1994, is now appropriate because of the delay in publication of these rules.

The agency is thus providing the most time for compliance permissible under the 1990 amendments, as requested by these comments, although the total compliance time provided will be closer to 15 than 18 months.

The agency fully expects that many firms will begin to comply well in advance of the May 8, 1994, date of application of the nutrition labeling and nutrient content claim provisions. For firms that have their own inhouse analytical testing or printing capability, the transition will be easier than for those who do not. Some firms are already conducting nutritional analysis of their products and may be able to comply before the required date. Some firms may receive favorable positions in the queue of label printers and may complete labeling well in advance of the May 8, 1994, date. As these firms complete nutritional analysis and labeling, they will begin to use the revised labels. Therefore, consumers will receive some of the expected health benefits of the label changes during the period between May 8, 1993, and May 8, 1994.

VI. Effective Date of Regulations Implementing Sections 403(q) and 403(r)(2) of the Act

The agency is announcing that the regulations implementing sections 403(q) and 403(r)(2) of the act will be effective May 8, 1994, the date that the agency will begin to apply these provisions. Under section 10(b)(1)(D) and (E) of the 1990 amendments, the effective date of the regulations implementing sections 403(q) and 403(r)(2) of the act need not be the same as the effective date of those provisions. There is nothing in the 1990 amendments nor in the legislative history that states when FDA's regulations are to be effective. FDA is, therefore, free to make them effective on whatever date it considers appropriate.

The agency has chosen May 8, 1994. As a result, the current regulations on nutrition labeling and nutrient content claims will remain in effect until the agency begins to enforce the new statutory provisions on these matters. The agency finds that it would be most appropriate to have the new regulations that implement those provisions take effect at that time. Thus, on the effective date of the final rule on nutrition labeling, current § 101.9 (21 CFR 101.9) will disappear and be replaced by the new provision.

Therefore, under the act and under authority delegated to the Commissioner of Food and Drugs, FDA is establishing May 8, 1994, as the effective date of the regulations implementing sections 403(q) and 403(r)(2) of the act (except section 403(q)(4)), with a date of applicability of May 8, 1994.

Accordingly, compliance with the implementing final regulations on mandatory nutrition labeling and nutrient content claims published elsewhere in this issue of the **Federal Register** in response to the following November 27, 1991, proposals: (1) Food Labeling: Reference Daily Intakes and Daily Reference Values and Nutrition Labeling, Mandatory Status and Content Revision (Docket Nos. 90N–0134 and 90N–0135) (56 FR 60366); (2) Serving Sizes (Docket No. 90N–0165) (56 FR 60394); (3) Nutrient Content Claims, General Principles, Petitions, and Definition of Terms (Docket No. 91N–0384) (56 FR 60421); (4) Definitions of Nutrient Content Claims for the Fat, Fatty Acid, and Cholesterol Content (Docket No. 84N–0153) (56 FR 60478); (5) Use of Nutrient Content Claims for Butter (Docket No. 91N–0344) (56 FR 60523); (6) Food Standards: Requirements for Substitute Foods Named by Use of a Nutrient Content Claim and a Standardized Term (Docket No. 91N–0317 et al.) (56 FR 60512); and (7) Format for Nutrition Label (Docket No. 91N–0162) (57 FR 32058, July 20, 1992) may begin immediately. All products initially introduced into interstate commerce on or after May 8, 1994, shall comply.

VII. Economic Impact

In its food labeling proposals of November 27, 1991 (56 FR 60366 et seq.), FDA stated that the food labeling reform initiative, taken as a whole, would have associated costs in excess of the $100 million threshold that defines a major rule. Thus, in accordance with Executive Order 12291 and the Regulatory Flexibility Act (Pub. L. 96–354), FDA developed one comprehensive RIA that presented the costs and benefits of all of the food labeling provisions taken together. That RIA was published in the **Federal Register** of November 27, 1991 (56 FR 60856), along with the food labeling proposals, and the agency requested comments on the RIA.

FDA has evaluated more than 300 comments that it received in response to the November 1991 RIA. FDA's discussion of these comments is contained in the agency's final RIA, published elsewhere in this issue of the **Federal Register**. In addition, FDA will prepare a final regulatory flexibility analysis (RFA) subsequent to the publication of the food labeling final rules. The final RFA will be placed on file with the Dockets Management Branch (HFA–305), Food and Drug Administration, rm. 1–23, 12420 Parklawn Dr., Rockville, MD 20857, and a notice will be published in the **Federal Register** announcing its availability.

Comments to the November 1991 RIA indicated that costs of complying with the proposed May 8, 1993, effective date would exceed FDA's estimate in the RIA. These costs would include queuing costs to food manufacturers trying to comply with the short deadline to relabel food products. The final RIA contains revised cost estimates for the societal costs involved, which, for the most part, do not include queuing costs. Such costs, which have been analyzed in this document, are largely transfers between food manufacturers and labeling firms.

FDA concludes, based on its review of available data and comments, that the costs of the overall food labeling reform initiative will be reduced by nearly one-

half (a cost savings of approximately $700 million) by extending the date for compliance with the food labeling requirements to May 8, 1994. Further, the agency concludes that this action will significantly alleviate the economic hardship that would otherwise result if sections 403(q) and 403(r)(2) of the act were made applicable, as proposed, on May 8, 1993.

VIII. Environmental Impact

The agency previously considered the environmental effects of the action being taken in this final rule. As announced in the reproposed rule for mandatory nutrition labeling (56 FR 60366, November 27, 1991) and the proposed rule for nutrient claims (56 FR 60421, November 27, 1991), the agency determined that under 21 CFR 25.24(a)(8) and (a)(11), these actions are of a type that do not individually or cumulatively have a significant impact on the human environment. Therefore, neither an environmental assessment nor an environmental impact statement was required.

Several comments on the proposed rule suggested that there would be significant adverse environmental effects from the final rules unless the agency allowed more time between the publication of the final rules and their effective dates. The concern in these comments was that, if the agency did not allow firms more time between the publication of the final rules and their effective dates to use up existing label inventories, large stocks of labels and labeled packaging would have to be discarded. These comments questioned whether the agency had sufficiently examined the impact of disposing of obsolete labels and labeled packaging on this country's solid waste disposal capabilities. Two comments estimated the amounts of labeling from their respective industries, i.e., dairy and confectionery, that would need to be discarded following publication of FDA's final rules on several food labeling actions, including this action. However, these comments did not: (1) Provide details on how these estimates were derived, (2) identify what portion of the estimated amounts are attributable to these two actions, or (3) describe what impact the discarded labels and packaging would have on the disposal of solid waste. In its November 27, 1991, reproposed rule for mandatory nutrition labeling and proposed rule for nutrient content claims, the agency proposed that the final rules for these actions would become effective 6 months following their publication in the **Federal Register**.

However, the agency has decided to not make these rules effective until May 8, 1994. FDA believes there will thus be ample time for food companies to use up most of the existing labeling and packaging stocks and to incorporate labeling language that complies with FDA's regulations into their food labels. Consequently, the comments on the potential for adverse environmental effects do not affect the agency's previous determination that no significant impact on the human environment is expected and that an environmental impact statement is not required.

Dated: December 17, 1992.

David A. Kessler,

Commissioner of Food and Drugs.

Louis W. Sullivan,

Secretary of Health and Human Services

RIN 0905–AD08

Food Labeling: Mandatory Status of Nutrition Labeling and Nutrient Content Revision, Format for Nutrition Label

AGENCY: Food and Drug Administration, HHS.

ACTION: Final rule.

SUMMARY: The Food and Drug Administration (FDA) is amending its regulations to: (1) Require nutrition labeling on most foods that are regulated by FDA, (2) revise the list of required nutrients and food components and the conditions for declaring them in nutrition labeling, (3) specify a new format for declaring nutrition information, (4) allow specified products to be exempt from nutrition labeling, and (5) prescribe a simplified form of nutrition labeling and the circumstances in which such simplified nutrition labeling may be used. This final rule also responds to citizen petitions on the declaration of dietary fiber in nutrition labeling and on methodologies for determining protein content.

DATES: Effective February 14, 1994. The Director of the Office of the Federal Register approves the incorporation by reference in accordance with 5 U.S.C. 552(a) and 1 CFR part 51 of certain publications in 21 CFR 101.9(c)(1)(i)(A), (c)(1)(i)(B), (c)(1)(i)(C), (c)(1)(i)(E), (c)(6), (c)(7)(ii), (c)(7)(ii)(B), and (g)(2), effective (February 14, 1994).

FOR FURTHER INFORMATION CONTACT: Virginia L. Wilkening, Center for Food Safety and Applied Nutrition (HFF–200), Food and Drug Administration, 200 C Street SW., Washington, DC 20204, 202–205–4561.

SUPPLEMENTARY INFORMATION:

I. Background

In the Federal Register of July 19, 1990 (55 FR 29847), FDA published a proposed rule entitled "Food Labeling; Mandatory Status of Nutrition Labeling and Nutrient Content Revision" (hereinafter identified as "the mandatory nutrition labeling proposal") to amend its food labeling regulations to require nutrition labeling on most food products that are meaningful sources of nutrients. FDA also proposed to revise the list of nutrients and food components that must be included in nutrition labeling by adding calories from fat, saturated fatty acids, cholesterol, and dietary fiber to that list. It proposed to make the listing of thiamin, riboflavin, and niacin optional rather than mandatory. In addition, FDA addressed the conditions under which other nutrients could be, or are required to be, included in nutrition labeling and proposed to allow manufacturers to voluntarily include a nutrition profile of selected food components in nutrition labeling.

During the comment period for these proposed regulations, Congress passed, and the President signed into law, the Nutrition Labeling and Education Act of 1990 (the 1990 amendments) (Pub. L. 101–535, November 8, 1990). The 1990 amendments amended the Federal Food, Drug, and Cosmetic Act (the act) by adding section 403(q) (21 U.S.C. 343(q)) which specifies, in part that: (1) With certain exceptions, a food is to be considered misbranded unless its label or labeling bears nutrition labeling, (2) certain nutrients and food components are to be included in nutrition labeling, although the Secretary of Health and Human Services (the Secretary) can add or delete nutrients by regulation if he finds such action necessary to assist consumers in maintaining healthy dietary practices, (3) nutrition labeling is to be provided for the most frequently consumed varieties of raw produce (fruits and vegetables) and raw fish according to voluntary guidelines or, if necessary, regulations, (4) a simplified nutrition label is to be used when the food contains insignificant amounts of most nutrients, and (5) FDA is to develop regulations governing labeling of foods to which section 411 of the act (21 U.S.C. 350) applies.

In response to these requirements of the 1990 amendments, FDA published in the Federal Register of November 27, 1991 (56 FR 60366; as amended (57 FR 8178, March 6, 1992)) a proposal (hereinafter identified as the supplementary proposal) to modify its July 19, 1990, proposal by: (1) Adding sugars and complex carbohydrates to the list of required nutrients in nutrition labeling, (2) prescribing a simplified form of nutrition labeling and the circumstances in which such simplified nutrition labeling must be used, (3) allowing specified products to be exempt from nutrition labeling, and (4) establishing regulations for the nutrition labeling of vitamin and mineral supplements. The agency also responded to a citizen petition regarding methodologies for determining protein quality. Interested persons were given until February 25, 1992, to comment.

Subsequently, FDA published in the Federal Register of July 20, 1992 (57 FR 32058; amended at 57 FR 37190, August 18, 1992), a proposal (hereinafter identified as the format proposal) to adopt a new format, specifically the PERCENT DV (Daily Value) with DRV (Daily Reference Value) format, for use in presenting nutrition information on the food label. Interested persons were given until August 19, 1992, to comment. In addition, on July 23, 1992, a notice was published in the Federal Register (57 FR 32750) of a public meeting to be held on the format proposal in Bethesda, MD, on August 17, 1992.

On October 6, 1992, Congress passed the Dietary Supplement Act of 1992 (H.R. 6181) (hereinafter referred to as the "DS Act") that, in section 202(a)(1), establishes a 1 year moratorium on the implementation of the 1990 amendments with respect to dietary supplements of vitamins, minerals, herbs, or other similar nutritional substances. Section 202(a)(2) requires the Secretary, and by delegation FDA, to issue new proposed regulations that are applicable to dietary supplements no later than June 15, 1993, and final regulations by December 31, 1993. In addition, section 203 instructs FDA to not promulgate regulations that require the use of, or are based upon, recommended daily allowances of vitamins or minerals before November 8, 1993 (other than regulations establishing the United States Recommended Daily Allowance (U.S. RDA) specified in 21 CFR 101.9(c)(7)(iv) as in effect on October 6, 1992).

FDA received approximately 1,500 responses to its July 19, 1990, mandatory nutrition labeling proposal, approximately 3,000 responses to the November 27, 1991, supplementary proposal, and approximately 1,000 responses to the July 20, 1992, format proposal, each of which contained one or more comments. Responses were received from consumers, health professionals, health promotion organizations, trade and retail associations, State and local governments, foreign governments, professional societies, consumer advocacy organizations, industry, and universities. The comments generally supported the proposals. Several comments addressed issues covered by other proposals that are a part of this overall food labeling initiative, and they will be addressed in those final documents, while other comments were outside the scope of these proposals and will not be discussed here. Many

comments dealt with issues pertaining to meat and poultry products whose labeling is regulated by the U.S. Department of Agriculture (USDA). Of those comments, comments pertaining to the content or format of the nutrition label are included in the following discussions. However, comments pertaining to issues covered exclusively by USDA, such as specific exemptions applicable to meat and poultry products, were considered to be outside the scope of this document.

A number of comments to both the July 19, 1990, and November 27, 1991, proposals suggested modifications in, or were opposed to, various provisions of the proposals. A summary of the suggested changes, the opposing comments, and the agency's responses follow.

II. Mandatory Nutrition Labeling—Legal Authority

1. Most comments agreed that the 1990 amendments clearly established FDA's authority to mandate nutrition labeling on most foods. One comment, however, argued that a requirement that labels say or not say certain things curtails freedom of the press.

The agency disagrees. FDA's authority to regulate the content of food labels has been broadly upheld against First Amendment challenges. This issue is discussed at length in both the final rule on nutrient content claims entitled "Food Labeling: Nutrient Content Claims, General Principles, Petitions, Definition of Terms" and the final rule on health claims entitled "Food Labeling; General Requirements for Health Claims for Food," both of which are published elsewhere in this issue of the **Federal Register.** Those discussions are incorporated in this document by reference. As those discussions make clear, there is no merit to this comment. Therefore, FDA is taking no action on the basis of this comment.

2. One comment objected to FDA being given authority to mandate nutrition labeling on most foods on the basis that current nutrition labeling rules were legally questionable.

The question of FDA's authority to require nutrition labeling was a fundamental issue that led Congress to pass the 1990 amendments. As discussed in the legislative history, Congress concluded that legislation was needed to strengthen FDA's authority to require nutrition labeling on foods and to avoid the possibility of protracted litigation over the comprehensive nutrition labeling regulations that the agency adopts (Ref. 16). Therefore, there can be no question about FDA's authority to require nutrition labeling on most food products.

III. Content of the Nutrition Label

A. General Issues

1. Voluntary Declaration of Additional Information

3. A number of comments objected to the voluntary declaration of nutrients beyond those required in nutrition labeling. Numerous comments stated that the declaration of additional information on the food label would be confusing, or that it might mislead the consumer into believing that a product with additional nutrients listed is more nutritious or has greater public health significance than is the case. Some comments objected on the basis that the additional information would clutter the label and diminish the consumer's focus on mandatory nutrients. A few comments expressed concern that voluntary declaration of additional nutrients on the label will require smaller print on the food label to accommodate the inclusion of all the mandatory and voluntary information, and that the smaller type size would compromise the usefulness of the label information to the elderly or visually impaired.

A number of comments supported the voluntary listing of additional nutrients, pointing out that the 1990 amendments require that the regulations permit the label or labeling of food to include nutrition information, which is in addition to the information required by section 403(q) of the act and which is of the type described in subparagraph (1) or (2) of that section. A few comments supported the view that voluntary listing of additional nutrients may provide valuable information to an individual or aid the consumer in making an informed choice in food selection. Other comments supported voluntary listing of additional nutrients stating that some nutrients may satisfy nutrient needs of some individuals or pose a health risk to others. One comment pointed out that the Institute of Medicine (IOM) report (Ref. 1) recommends that regulations allow the declaration of all micronutrients for which Recommended Dietary Allowances have been established by the National Academy of Sciences.

Numerous comments that basically supported listing of additional information also supported limiting the information allowed. Some comments supported allowing voluntary information, but they suggested that FDA standardize the manner in which it is included on the label to the extent of requiring that it be separate from the nutrition label or in different type size. Five comments requested voluntary listing of specific nutrients including: Potassium; vitamins E, K, and B6; copper; manganese; iodine; maltodextrin; and L-glutamate, L-cysteine, and L-tryptophan. Two comments supported the listing of additional nutrients but recommended restricting the allowed nutrients to those for which Recommended Dietary Allowances have been set by the National Academy of Sciences (Ref. 23) or for which Reference Daily Intakes (RDI's) have been determined by FDA. One of these comments further suggested restricting the allowed nutrients to exclude nutrients that do not have Recommended Dietary Allowances but only have Estimated Safe and Adequate Daily Dietary Intakes (ESADDI's), which are also set by the National Academy of Sciences (Ref. 23). One comment suggested that additional information on the food label be restricted to information permitted by the Council of the European Communities (EC).

FDA, in its mandatory nutrition labeling proposal of July 19, 1990, proposed to allow the voluntary declaration of several nutrients (e.g., potassium and soluble fiber) and any naturally occurring vitamins and minerals for which RDI's had been proposed in § 101.9(c)(10)(iv) (21 CFR 101.9(c)(10)(iv)), which was redesignated as § 101.9(c)(11)(iv) in the November 27, 1991, proposal. Additionally, section 2(b)(1)(C) of the 1990 amendments states that regulations shall permit the label or labeling of food to include nutrition information that is in addition to the information required by section 403(q) of the act and that is of the type described in subparagraph (1) or (2) of that section. Section 403(q)(2) of the act refers to information that will assist consumers in maintaining healthy dietary practices.

FDA believes that it is required by statute to allow additional information on the food label insofar as it assists consumers in maintaining healthy dietary practices. However, the agency raised questions in the supplementary proposal about how the presence of these additional nutrients on the label would be interpreted by consumers, and whether the listing of some voluntary nutrients would actually be misleading (56 FR 60366 at 60372). The comments confirmed that unlimited additional information on the nutrition label would have the potential of being confusing or misleading.

FDA requested comments on whether it is necessary to include limits on the voluntary information that may be

provided on the nutrition label. The comments that FDA received on this issue have lead the agency to conclude that it has a responsibility to limit the number of nutrients permitted to be voluntarily listed on the food label. Such a limitation reflects the statement in the House report (Ref. 16, p. 18) that the regulations that FDA adopts should assure that the information that is included voluntarily does not interfere with the consumer's understanding of the information that is required to be included on the nutrition label. The agency finds that limits are necessary so that the emphasis is on the required information, and that the additional information does not clutter the food label or mislead or confuse the consumer.

Therefore, to limit the information that may be provided on the nutrition label, FDA is amending the proposed regulations to delete "calories from unsaturated fat," "calories from carbohydrates," "calories from protein," and quantitative declarations of "unsaturated fat" from the list of nutrients that are allowed to be declared voluntarily on the nutrition label. Each of these deletions is detailed below. FDA has decided to permit the voluntary declaration on the nutrition label of "calories from saturated fat," "polyunsaturated fat," "monounsaturated fat," "soluble fiber," "insoluble fiber," "sugar alcohol," "other carbohydrate," "potassium" and those vitamins and minerals for which RDI's have been established.

With respect to other nutrients suggested by individual comments for consideration for voluntary listing on the food label, the agency has not been persuaded that there are large numbers of consumers who desire a voluntary listing of the food components in question (e.g., maltodextrin or single amino acids. Therefore, FDA will not allow voluntary listing of these other substances or food components on the nutrition label. To implement this section, FDA has added a sentence to § 101.9(c) that states that no nutrients or food components other than those set forth in that section as either mandatory or voluntary may be included in the nutrition label. The inclusion of any other nutrient or food component would violate section 403(q) of the act and misbrand the food.

Also, while FDA supports efforts toward international harmonization of food labeling where possible, the 1990 amendments direct FDA to permit that a broad spectrum of nutrients be on the food label unless the agency finds that the information is not necessary to assist consumers in maintaining healthy dietary practices, a finding that FDA has generally not made. As a result, the spectrum of required and permitted nutrients exceeds those permitted by the EC.

FDA is not requiring that additional nutrients declared voluntarily be put in separate boxes or a different type size because it believes these actions would confuse consumers and would complicate and clutter the label needlessly. In some instances additional nutrients, whose declaration is usually voluntary, will be required to be declared. For example, in the case of fortified foods, enriched pasta must declare amounts of thiamin, riboflavin, and niacin, and margarine must declare vitamin D when it is added. In other cases, if certain claims are made, additional nutrients will be required to be declared. For example, when nutrient content claims are made about cholesterol, declaration of poly- and monounsaturated fats are required (see § 101.9(c)(2) (i) and (ii). Placing these nutrients in the principal box for nutrition labeling when required, and in a separate box (or different type size) when voluntarily added to the nutrition label would easily confuse consumers. Also, separating subcomponents that can voluntarily be declared, such as soluble and insoluble fiber, from the primary component, dietary fiber, for which declaration is mandatory, would unduly complicate the label.

However, in response to comments concerned that information on additional nutrients would clutter the label and to comments on the format proposal, FDA is providing in new § 101.9(d)(8) for a linear array of vitamins and minerals. This form of presentation, which is discussed in more detail in section V. of this document, is similar to that recommended in the IOM report (Ref. 1) which places more emphasis on the macronutrients.

2. Order of Nutrients

4. Several comments from industry, health promotional organizations, and academia supported the order of nutrients proposed by FDA in § 101.9(c) (56 FR 60366 at 60386 through 60390). One industry comment stated that the proposed sequence fairly prioritized the Dietary Guidelines for Americans (Ref. 4) and placed the proper emphasis on those dietary factors that affect the health of consumers. This comment, along with one from a health promotion organization, also endorsed the separation of vitamins and minerals from other nutrients seen in proposed formats [57 FR 32058], stating that this feature represented a logical break in the list of nutrition information and would both improve label readability and facilitate consumers' search for specific nutrient data. Another comment supporting the proposed order endorsed the listing of nutrients from those most important to consumers to those least important to consumers but questioned whether protein should be included.

On the other hand, several comments argued that the proposed order of nutrients has features that would mislead consumers. One comment characterized the proposed order as "an unwarranted effort to overemphasize some nutrients, such as fat, at the expense of the other important label components" and suggested that the decision on whether to emphasize one nutrient over another should be left to nutrition education programs that consider the total diet over a long period of time. Other industry comments criticized the proposed order of nutrients, stating that it would be consistent with the "good food/bad food" concept and would convey a negative impression to consumers. One industry comment supporting the current order of nutrients argued that protein should not be listed near the end, stating that beneficial nutrients should be listed at the beginning of the nutrient list. The comment suggested that from an educational standpoint, it is more positive to educate on the good points of nutrition labeling than to focus on negative aspects.

A number of comments advocated that the current order of nutrients be maintained, or that any modified order resemble the current order as closely as possible. Several comments supporting the current order of nutrients stated that consumers are already accustomed to the current order, and that changing the order would lead to unnecessary confusion and diminish consumers' understanding of the nutrition label.

A few comments suggested alternative nutrient orders. A comment from a professional organization stated that those nutrients whose overconsumption is related to increased risk of disease should be placed at the top of the list of required nutrients. One industry comment recommended that nutrients be regrouped to first list those nutrients whose Daily Value is dependent on calorie intake (i.e., total fat, saturated fat, carbohydrate, dietary fiber, and protein), followed by those whose Daily Value remains the same for varying calorie intakes (i.e., cholesterol and sodium). Another comment requested that sodium be listed with the vitamins and minerals rather than among the organic macronutrients.

A comment from a manufacturer addressed the issue of where to place the voluntary nutrients on the label. The comment suggested that voluntary nutrients should be sequenced in a logical manner with respect to the nutrients whose declaration is mandatory. The following examples were cited: Unsaturated fat should follow saturated fat (both should be indented), potassium should follow sodium, soluble and insoluble fiber should follow dietary fiber, and vitamins and minerals should follow those that are mandatory.

The agency is not persuaded by arguments stating that listing nutrients in order of public health importance will cast foods as either "good foods" or "bad foods." Listing nutrients in this manner will instead facilitate selection of an overall diet that is consistent with dietary guidelines based on what nutrients are present in a particular food and in what amounts. No data were presented to show that use of this nutrient order on the nutrition label is likely to be confusing to consumers.

The agency also does not agree with the request that sodium be placed with vitamins and minerals rather than with the organic macronutrients. Sodium is an electrolyte that is distinct from both organic nutrients and vitamins and minerals. However, excessive intake is associated with a potential increase in the risk of chronic diseases, as are excessive intakes of the other mandatory organic nutrients (i.e., macronutrients such as fat) in the nutrition label. Vitamins and minerals generally are associated with deficiency diseases. The agency believes this categorization supports the continued placement of sodium with the organic nutrients.

FDA agrees that the placement of voluntary nutrients should be sequenced in a logical manner with respect to the mandatory nutrients. FDA has provided in new § 101.9(c) that voluntary nutrients that are subcomponents are to be declared immediately beneath the primary components, and that potassium (the second electrolyte) is to be declared adjacent to sodium.

The agency believes that a revised order according to the public health significance of a nutrient will adequately convey nutrient information with no appreciable increase in consumer effort. This action is based on the order provided in section 403(q)(1) of the act (see Ref. 16, p. 13) and the comment recommending that nutrients whose overconsumption is related to increased risk of disease should be placed at the top of the list of required nutrients.

Accordingly, new § 101.9(c) is modified to require mandatory and voluntary nutrients to be arranged in the following order: Calories, calories from fat, calories from saturated fat, total fat, saturated fat, polyunsaturated fat, monounsaturated fat, cholesterol, sodium, potassium, total carbohydrate, dietary fiber, soluble fiber, insoluble fiber, sugars, sugar alcohol, other carbohydrate, protein, vitamin A, vitamin C, calcium, iron, and other vitamins or minerals in the order listed in proposed § 101.9(c)(11)(iv), redesignated as § 101.9(c)(8)(iv). This order deviates from that provided in section 403(q)(1) of the act only by reversing dietary fiber (and its subcomponents) and sugars. The reason for this reversal is discussed in comment 58 of this document.

Consequently, the paragraphs in § 101.9(c) are renumbered as discussed below for each nutrient. Redesignations also occur as a result of moving paragraphs (c)(1) and (c)(2) pertaining to serving size and servings per container, respectively, to new paragraph (d).

The agency believes that this amended order of nutrients, which lists them in order of public health significance, will benefit consumers. The agency's decision is a reasonable outgrowth of its commitment to present nutrition information in the context of a total daily diet, and it reflects the agency's commitment to link nutrient information with the dietary guidance considered important to public health (Ref. 4).

B. Calories

1. Total Calories

5. The majority of comments supported the proposal for mandatory declaration of calories with voluntary use of metric terminology (i.e., declaration of the number of kilojoules in addition to calories in proposed § 101.9(c)(3), redesignated as § 101.9(c)(1), and voluntary use of the term "energy" parenthetically as a synonym for calories, as provided in § 101.9(c)(11)(v), redesignated as § 101.9(c)(8)(v)).

Other comments expressed a preference for metric labeling. The comments argued that American consumers should become accustomed to the metric system of measurement and recommended the exclusive use of metrics to ensure compatibility with European markets. The comments suggested that the avoirdupois system of measurement used in the United States is outmoded and impedes international commerce and the exchange of scientific information. Several comments suggested that "energy" should be used in lieu of calories and requested that the conversion factor for calories to kilojoules be stated on each label.

Still other comments, taking the opposite position, suggested that metric units be disallowed to avoid consumer confusion and for the sake of simplicity.

Although FDA agrees that efforts should be made to familiarize consumers with metric units, the agency disagrees with the comments that urged the exclusive, mandatory conversion to metrics at this time. The technical amendments (August 3, 1992) to the Fair Packaging and Labeling Act (15 U.S.C. 1451 et seq., Pub. L. 102–329) require the use of the most appropriate units of both the customary inch/pound system of measure and the metric system on food labels for measuring quantity. These amendments do not require that kilojoules be declared in lieu of calories. Upon implementation, this act should further an awareness of metric measurement among American consumers and permit a greater concordance in units of measurement with the international market and scientific community. Until that time, the agency is not persuaded that the mandatory use of metric terminology, or the declaration of factors to convert calories to kilojoules, is justified. Accordingly, the agency is not making the requested changes.

2. Calories From Fat

6. Many comments were received from consumers, state and local governments, universities, professional associations, consumer groups, manufacturers, and health associations on the issue of calories from fat. The majority agreed with the proposal that the declaration of calories from fat should be mandatory on the nutrition label.

Several other comments suggested that calories from fat be voluntarily listed or disallowed because this information might be confusing or misleading to consumers and might establish artificial "good food" and "bad food" categories. These comments stated that consumers may tend to exclude foods with a significant amount of calories from fat, possibly creating nutritional deficiencies. Further, these comments stated that it is important that consumers view fat as part of a day's diet rather than in the context of individual foods. A few comments suggested that declaring the calories from fat is unnecessary because calories from fat can be easily calculated by multiplying the number of grams (g) of fat by nine, the number of calories per g of fat. A few comments suggested that

there be further study of the effectiveness of the declaration of calories from fat in nutrition labeling as a nutrition education tool. One comment suggested that low fat foods, such as fruits and vegetables that contain less than 2 g of fat, be exempted from the requirement to list calories from fat.

FDA is not persuaded by the arguments that the declaration of calories from fat should be voluntary or disallowed. The declaration of calories from fat is required by section 403(q)(1)(C)(ii) of the act. While section 403(q)(2)(B) of the act allows the Secretary to delete nutrient information that is not necessary to assist consumers in maintaining healthy dietary practices, no data were presented that would support making such a finding with respect to the declaration of calories from fat.

It is well established that diets that are high in fat pose significant health risks. Dietary fat contributes more than twice the calories per g than does protein or carbohydrate. Overconsumption of fat is associated with higher rates of obesity (Refs. 2 and 3), and there is evidence from epidemiological and animal studies that high fat intakes are associated with some types of cancer (Refs. 2 and 3). The most common and consistent dietary recommendation for the general population is for calories from total fat to be reduced to less than or equal to 30 percent of total calories (Refs. 3 and 4).

Currently, the consumption of total fat in the general population is approximately 37 percent of total calories, an amount well above the recommended level (Ref. 2). Further, consumption of total fat in the United States is significantly higher than that consumed in countries with much lower rates of coronary heart disease, such as Japan, China, and the Mediterranean countries (Ref. 2).

Based upon this body of evidence, FDA believes that reducing total fat intake is an important public health priority. The agency is not persuaded that the declaration of calories from fat will automatically lead to consumers viewing foods in strict "good food," "bad food" categories, or that consumers cannot make appropriate decisions regarding the consumption of foods that may have a significant number of calories from fat in their diets. No evidence was presented demonstrating a relationship between the declaration of calories from fat in nutrition labeling and nutritional deficiencies.

Although calories from fat can, in fact, be readily calculated (FDA is requiring that information on the number of calories per g of fat, carbohydrate, and protein, be included as part of the nutrition label (see § 101.9(d)(10)), the declaration of calories from fat will be beneficial in assisting consumers to moderate their fat intake by providing an additional method, other than g of fat, for monitoring their fat intake.

However, the agency concurs that fat should be viewed as a part of the complete daily diet. Foods that may have a significant number of calories from fat may readily be included in the daily diet when the overall fat intake for the day is moderate. The agency intends to build this concept into its consumer education program, discussed later in this document. Further, FDA welcomes further study on the health implications of overconsumption of calories from fat and the effectiveness of this method of depicting fat content.

7. Many comments advocated the mandatory declaration of the percent of calories from fat. Other comments suggested that calories from total fat should be replaced by the percent of calories from fat. The comments stated that the process of determining the percent of fat is time consuming and unfamiliar to many consumers. Further, the comments argued that it is unlikely that substantial numbers of consumers would or could keep running totals of their fat intake in order to calculate the percent of daily fat consumed. The comments argued that the best way to determine whether a food is high or low in fat is to have fat content declared by percent of total calories.

A few comments suggested that percent of calories from fat for individual foods is incomplete information, while the percent of calories from fat for a complete meal or the daily diet is useful information. These comments suggested that the percent of calories from fat be voluntary and limited to meal-type products, such as frozen dinners, and disallowed for other foods.

The agency is not persuaded by the comments that the declaration of percent calories from fat is warranted. As discussed in the July 19, 1990, mandatory nutrition labeling proposal (55 FR 29487 at 29493 and 29494), information on the percent of calories from fat is only valuable in the context of a total daily diet. Recommendations from various health organizations to limit dietary fat intake to 30 percent or less of calories pertain not to individual foods but to the entire day's intake.

In addition, the percent of calories from fat in low calorie foods can be quite misleading. For instance, in radishes, over 25 percent of calories are from fat. Despite this relatively high percentage, radishes contain very low amounts of fat and readily fit within a daily diet that meets current dietary recommendations.

The agency agrees that calculating the percent of calories from fat consumed in a day may be difficult for many consumers. The agency notes that the PERCENT DV format (see section V.G.2) facilitates monitoring of dietary fat because the Daily Value for fat is set at 30 percent of calories from fat. Consumers need only add the percent DV for total fat with a target of no more than 100 percent or a target percentage adjusted for their individual caloric intake. Alternatively, consumers can determine the maximum number of g of fat recommended per day at their calorie level and track the number of g of fat. There are several publications listing recommended daily maximum amounts of fat according to caloric intake or that have simple arithmetical methods for deriving this information (Refs. 26 through 29). In a similar fashion, the DRV for fat, which is established in the companion document entitled "Food Labeling; Reference Daily Intakes and Daily Reference Values" (hereinafter identified as the "RDI/DRV proposal") published elsewhere in this issue of the Federal Register, can be used as a guide, with levels being adjusted upward or downward depending on caloric intake. The agency encourages other organizations to develop and publish similar approaches.

8. One comment objected to that section of § 101.9(c)(3)(i) in the July 19, 1990, mandatory nutrition labeling proposal that allowed "calories from fat" to be omitted and replaced with the statement "Not a significant source of calories from total fat" if the product contains less than 1 g of fat per serving. The comment objected to similar provisions for saturated fat, cholesterol, and dietary fiber on the basis that it made the regulations complex and confusing. These provisions were carried forward in the November 27, 1991, supplementary proposal with the 1-g criterion being changed to ½ g, and similar provisions being added for complex carbohydrates and sugars.

These provisions were included in the July 19, 1990, mandatory nutrition labeling proposal (55 FR 29487 at 29502), which was published before the adoption of the requirement in section 403(q)(5)(C) of the act for a simplified format, to minimize the space required for nutrition labeling. This provision is similar to that allowed in current § 101.9(c)(7)(i) for vitamins and minerals that are present in amounts less than 2 percent of the U.S.

Recommended Daily Allowance (U.S. RDA). FDA did not delete these provisions in the November 27, 1991, supplementary proposal because the agency believed they might be helpful in minimizing space requirements on foods that do not qualify for the simplified format under proposed § 101.9(f).

FDA finds that the added flexibility that these provisions provide outweighs any added complexity they may create. USDA's final nutrition labeling regulations, which are being published simultaneously with these final rules, include similar provisions. Under FDA's regulations, with the exception of the core nutrients (i.e., calories, total fat, total carbohydrate, protein, and sodium), nutrients that are present in insignificant amounts may be omitted from the list of nutrients and grouped in a summary statement (e.g., "Not a significant amount of calories from fat, saturated fat, and cholesterol"). Therefore, the agency is retaining in § 101.9(c)(3)(i), redesignated as § 101.9(c)(1)(ii), for calories from total fat; in § 101.9(c)(4)(i), redesignated as § 101.9(c)(2)(i), for saturated fat; in § 101.9(c)(5), redesignated as § 101.9(c)(3), for cholesterol; in § 101.9(c)(6)(ii)(A), redesignated as § 101.9(c)(6)(ii), for sugars; in § 101.9(c)(7), redesignated as § 101.9(c)(6)(i), for dietary fiber; and in § 101.9(c)(11)(iii), redesignated as § 101.9(c)(8)(iii), for vitamins and minerals a provision that allows the nutrients to be omitted and replaced with a statement "Not a significant source of _____" when present in insignificant amounts. An example of this shortened format is given in appendix A of this document.

3. Calories From Saturated Fat

9. Several comments agreed with the proposal that declaration of calories from saturated fat should be voluntary. A few comments suggested that this information should be mandatory and referred to national dietary guidelines recommending that saturated fat be limited to less than 10 percent of total daily calories. A few comments requested that declaration of percent of calories from saturated fat be made mandatory.

Several comments believed that the declaration of calories from saturated fat should be disallowed. The comments argued that this information is redundant, confusing, and misleading.

FDA acknowledges that research has established the role of saturated fats in the etiology of atherosclerotic vascular disease and recognizes that there are national consensus recommendations regarding the levels of intake for saturated fat. However, section 403(q)(2)(A) of the act permits the Secretary to require the inclusion of information on additional nutrients in nutrition labeling if he determines that such information "will assist consumers in maintaining healthy dietary practices." The agency is not persuaded that the mandatory declaration of calories from saturated fat or the percentage of calories from saturated fat meet this criterion.

First, this information may be obtained by simple calculation if needed (i.e., calories from saturated fat can be calculated by multiplying the g of saturated fat by nine, the number of calories per g of fat; the percentage of calories from saturated fat can then be determined by dividing the number of calories from saturated fat by the total calories). Secondly, concerns have been expressed in comments that consumers will be faced with so much information that they will avoid using any of it. To minimize the possibility of this happening, FDA believes that it is preferable to have consumers concentrate on the number of calories from total fat. By controlling dietary intake of calories from fat, intake of calories from saturated fat will also be controlled.

However, in recognition of dietary recommendations that Americans should consume less than 10 percent of calories from saturated fat (Refs. 3, 4, and 30) FDA is continuing to allow voluntary declaration of calories from saturated fat in § 101.9(c)(3)(ii)(A), redesignated as § 101.9(c)(1)(iii).

4. Calories From Unsaturated Fat

10. Several comments agreed with proposed § 101.9(c)(3)(ii)(B) that the declaration of calories from unsaturated fat should be voluntary. A few comments suggested that the declaration of calories from unsaturated fat should be mandatory. These comments stated that caloric information on unsaturated fat would be helpful in monitoring unsaturated fat intake to maintain consumption of unsaturated fat at not more than the 20 percent of total calories.

Several other comments suggested that this information be disallowed because it will not be useful to the consumer in evaluating a total day's food intake, and because the information is potentially confusing.

A few comments requested that declaration of calories from monounsaturated and polyunsaturated fats be mandatory. One comment requested that declaration of the percent of calories from monounsaturated and polyunsaturated fats be mandatory. These comments stated that caloric or percentage information on monounsaturated and polyunsaturated fats would be helpful in limiting consumption of each of these two classifications of fatty acids to not more than 10 percent of total calories each.

The agency has decided not to permit declarations regarding calories from unsaturated fats because there is considerable uncertainty and controversy about the term "unsaturated fat" and its definition, specifically whether the "*trans*" isomers of monounsaturated fat should be included in this category of fats. These isomers have been implicated in the development of coronary heart disease and cancer (Ref. 31) and are discussed in the subject health claims rules published elsewhere in this issue of the **Federal Register.**

Further, the agency is not persuaded that it should allow the voluntary declaration of calories from monounsaturated and polyunsaturated fats. Definitions of monounsaturated and polyunsaturated fats include *cis* isomers only. *Trans* isomers are excluded. The declaration of calories from monounsaturated and polyunsaturated fats would therefore underrepresent the total caloric value of these fats because of the exclusion of the *trans* isomers. Such an underrepresentation would be misleading to consumers. Therefore, the agency is not allowing the declaration of calories from polyunsaturated and monounsaturated fats in the nutrition label.

11. One comment suggested that § 101.9(c)(3)(ii)(A) and (c)(3)(ii)(B) be modified to clarify that when the declaration of calories from saturated fat is declared adjacent to the declaration of g of saturated or unsaturated fat, that it be in a column headed "calories" as was stated in § 101.9(c)(3)(i) for calories from total fat.

The agency has reconsidered the proposed format in the supplementary proposal that would have allowed a separate column for listing calories. As discussed in section V. of this document, FDA is incorporating additional columns into the nutrition label to declare the percent of daily value and the daily value list. For this reason, the agency believes a column headed "calories" would add to label clutter and, therefore, has not made the suggested change. FDA has modified § 101.9(c)(1)(ii) to delete the option that calories from total fat be declared in a column headed "calories."

5. Calories From Carbohydrate

12. Several comments requested that the declaration of calories from carbohydrates be made mandatory so that consumers can monitor and adjust their intake of calories from carbohydrate to approach the recommended 50 to 60 percent of total calories. A few comments requested that the declaration of percent of calories from carbohydrate be made mandatory. Several comments agreed with the proposal to allow the voluntary listing of calories from carbohydrate. Several other comments requested that FDA not permit the declaration of calories from carbohydrate because this information is potentially confusing to consumers. These comments suggested that this information would not be helpful in evaluating a total day's food intake. A few comments argued that too much information is burdensome to the consumer, and that if it results in the manufacturer using smaller type size, it could make the information more difficult for the elderly to read. Further, the comments suggested that there was a danger of "information overload" and "label clutter."

Based on the comments to the July 19, 1990 and November 27, 1991, proposals, the agency has reconsidered its proposal to permit the voluntary declaration of calories from carbohydrate and has decided not to permit this declaration. As discussed in the mandatory nutrition labeling proposal of July 19, 1990 (55 FR at 29493), FDA's intent is to require the listing of only those nutrients that present public health concerns and for which quantitative intake recommendations have been made. FDA proposed to permit the voluntary declaration of calories from carbohydrate because of general recommendations that suggested that intake of carbohydrate should be increased to 50 to 60 percent of total calories but recognized that carbohydrate is not of pressing public health significance.

Based on its evaluation of the comments, FDA has become concerned that it will overemphasize the public health significance of carbohydrate if it allows the declaration of calories from this nutrient. Additionally, the legislative history of section (2)(b)(1)(C) of the 1990 amendments (Ref. 16) makes clear that while FDA must allow the declaration of additional nutrients in nutrition labeling, it must ensure that such information does not interfere with the consumer's understanding of the information required by the act. Thus, FDA considers it important to ensure the comprehensibility of the nutrition label.

The 1990 IOM report "Nutrition Labeling: Issues and Directions for the 1990s" (Ref. 1) emphasizes the importance of considering information quantity and complexity when determining the components of the food label (Ref. 1). The report suggests that too much information compromises the ability of many consumers to understand the label.

The agency is persuaded that because the amount of calories from carbohydrate is not of pressing public health significance, it should not provide for inclusion of this information in nutrition labeling. Accordingly, FDA has deleted proposed § 101.9(c)(3)(ii)(C) from the final regulation.

Consumers interested in determining the calories from carbohydrate for the vast majority of individual foods may simply multiply the number of g of carbohydrate by four, the number of calories per g of carbohydrate. Consumers attempting to compare their intake of carbohydrates to the recommended amounts of 50 to 60 percent of total caloric intake can use the Percent Daily Value format in the same way described for monitoring fat intake. Because the Daily Value for carbohydrate is set at 60 percent of calories, consumers need only add the percent DV for total carbohydrate with a target of 100 percent or a target of a percentage adjusted for their individual caloric intake. Alternatively, consumers can sum the g of carbohydrate consumed for the day, multiply the total by four, divide the result by the total calories consumed in that day, and multiply by 100 to obtain percent.

13. Although FDA chose not to propose the declaration of calories from sugars and complex carbohydrates, a few comments addressed this topic. Some of these comments stated that the declaration of calories from sugars and complex carbohydrates should be voluntary, and that this information, especially for sugars, was of interest to consumers. Other comments felt that the declaration of calories from sugars and complex carbohydrates should be mandatory. Both sets of comments felt that this information is potentially valuable to diabetics and parents of young children who are concerned about dental caries and excessive sugar intake. A few additional comments argued that the declaration of calories from sugars and complex carbohydrates is unnecessary and should not be permitted.

Interest in having calories from sugars and complex carbohydrates declared in the nutrition label was slight, and no data were presented to support the requests for such information. Further, dietary guidelines have not recommended specific quantitative amounts for caloric intake from sugars or complex carbohydrates. Therefore, the final rules do not permit the inclusion of such information in the nutrition label. FDA advises that the calculation of calories from sugars, which was of the most interest to the comments, can be easily calculated by multiplying the number of g of sugars present by four, the number of calories per g of sugars.

6. Calories From Protein

14. A few comments requested that the declaration of calories from protein as well as the percent of calories from protein be made mandatory to permit consumers to evaluate the quality of the food. Other comments agreed with the proposal for the voluntary declaration of calories from protein. On the other hand, additional comments suggested that this information would be confusing and misleading. These comments pointed out that concerns about protein intake are of limited public health significance in the United States and suggested that the declaration of calories would not be helpful in evaluating a total day's diet. The comments urged, therefore, that this declaration should not be permitted. One comment suggested that consumers would be tempted to overconsume protein if calories from protein were listed.

Upon consideration of the comments, FDA has reassessed its position. The agency agrees that the declaration of calories from protein and the percent of calories from protein are of limited usefulness to the consumer because the diets of the majority of Americans exceed the Recommended Dietary Allowances (Ref. 23) for protein. This lack of usefulness appears to outweigh any of the potential benefits of allowing the declaration of calories from protein. For this reason, and in an effort to reduce unnecessary information that might interfere with the consumer's understanding of required information, FDA is amending the final regulations by deleting proposed § 101.9(c)(3)(ii)(D) which allowed for the voluntary declaration of calories from protein.

Consumers interested in determining the calories from protein for an individual food may simply multiply the number of g of protein by four, the number of calories per g of protein. Consumers interested in determining the percent of calories from protein consumed in one day may add the g of protein consumed for the day, multiply

the total by four, divide the result by total calories consumed that day, and multiply by 100 to obtain percent.

7. Increments for Calories

15. The agency received only a few comments concerning the proposed change in § 101.9(c)(3) to delete the use of 2-calorie increments for expressing caloric content up to and including 20 calories per serving. Most of the comments agreed with the proposal which would express caloric content to the nearest 5-calorie increment up to and including 50 calories and to the nearest 10-calorie increment above 50 calories. While one comment disagreed with the proposed change to delete the 2-calorie increments on the basis that it would permit less accurate information for very low calorie foods, another comment considered 2-calorie differences as inconsequential to the consumer. Another suggestion was made to round all calorie levels to the nearest 5-calorie increment.

FDA is not persuaded by the comments that there is sufficient reason to maintain the use of 2-calorie increments for foods containing 20 or fewer calories or to use only 5-calorie increments. FDA acknowledges the concern expressed about very low calorie products. However, only a relatively small number of products will be affected by the change. In fact, the agency traditionally has been tolerant of slight differences in the declared and actual amounts of calories. Current § 101.9(e)(6), redesignated as § 101.9(g)(6), states that "Reasonable deficiencies of calories * * * under labeled amounts are acceptable within current good manufacturing practice." Thus, FDA is adopting this aspect of § 101.9(c)(3), redesignated as § 101.9(c)(1), as proposed.

C. Total Fat, Fatty Acids, and Cholesterol

1. Total Fat

In the mandatory nutrition labeling proposal, FDA proposed to require the declaration of fat, saturated fat, and cholesterol. In addition, FDA proposed definitions for saturated fat, unsaturated fat, polyunsaturated fat, and monounsaturated fat. The agency did not define "fat" (i.e., total fat) for nutrition labeling purposes. For compliance purposes, FDA has used as its definition the sum of compounds with lipid characteristics that are extracted by the Association of Official Analytical Chemists International (hereinafter referred to as AOAC) methods or by other reliable and appropriate analytical procedures (current § 101.9(e)(2)).

16. The agency received a number of comments concerning the agency's standards for assessing total fat. A few comments from food manufacturers and trade associations agreed with the customary method of estimating dietary fat. Comments from other food manufacturers, trade associations, college and university nutrition professionals, consumer advocate groups, other Government agencies, and foreign governments, disagreed with the agency's position regarding the determination of fat content. Some of these comments expressed uncertainty about what current declarations of fat represent. It became evident that some persons considered that the agency had implied a definition of total fat as the sum of all triglycerides by stating in current § 101.25(c)(2)(ii) that the amount of fatty acids was to be calculated as triglycerides. This statement led some comments to assume that mono- and diglycerides did not need to be included in the declaration of total fat.

Several comments suggested that the definition of fat should include all dietary lipids, especially mono-, di-, and triglycerides, phospholipids, and free fatty acids. These comments pointed out that advances in food technology have led to the development of fats and oils that reduce the triglyceride content found in foods by replacing triglycerides with mono- and diglycerides and phospholipids. These new forms of fats provide calories and should be included in total fat values declared in nutrition labeling.

One comment suggested changing the definition of fat to "substances possessing the physiological properties of fat." This comment stated that this definition would encompass all types of dietary fats. Another comment suggested that the definition be the "sum of fatty acids from a total lipid extraction." These comments pointed out that dietary lipids not only contribute to the total dietary caloric intake but have other physiologic functions attributable to fats. These functions include transporting of lipids and fat soluble vitamins in the body and structural functions in cell membranes, as well as serving as essential fatty acids and as precursors of certain hormones and eicosanoids.

Several comments suggested that FDA's position on total fat is not consistent with the definition found in Codex Alimentarius or with that used by the Canadian government and the EC. According to the comments, the international definition of fat is not restricted to triglyceride-releasable fatty acids but includes total free fatty acids and other lipids, including phospholipids.

A couple of comments suggested that the definition of fat should exclude some types of lipids (i.e., phospholipids, plant sterols, and novel lipids) because these lipids constitute only a small portion of total fat consumed, and, according to the comments, these types of lipids have not been reported as having a causal role in disease.

The agency is concerned about the obvious confusion caused by the lack of a precise definition for total fat. Because of the importance given to dietary recommendations to reduce the intake of total dietary fat, it is critical that all parties (i.e., Government agencies, food manufacturers, health professionals, nutrition scientists, and consumers) clearly understand what the values declared on the nutrition label represent.

Concerns that the total fat value not be underrepresented have persuaded the agency that it is not adequate to continue only using a reference to AOAC methods or "other reliable, appropriate analytical procedures." Such an approach allows for the use of many methods that measure different analytes. For example, according to AOAC procedures, "fat" content can be determined by ether or chloroform-methanol extraction. In the case of an ether extraction, results yield a value for neutral lipids which are primarily triglycerides (a complex lipid composed of glycerol and three fatty acids) and some mono- and diglycerides. In contrast, the chloroform-methanol extraction method extracts all classes of lipids. The two methods, which are both acceptable according to current regulations, may result in different values for total fat being obtained for the same product and different values being declared on the nutrition label.

The agency believes that the use of the implied definition of total fat as the sum of triglyceride fatty acids from saturated, polyunsaturated, and monounsaturated fatty acids, would in some cases underestimate both total g of fat and the caloric intake from fat. The agency agrees that all forms of fatty acids that contribute to energy intake of foods should be included in the calculation of total fat, particularly in view of dietary recommendations that target total fat intakes at 30 percent or less of calories.

For these same reasons, the agency disagrees with the suggestion that some lipids (e.g., mono- and diglycerides and phospholipids) be excluded from the definition of fat.

Therefore, the agency has decided to define total fat as total lipid fatty acids, that is, the sum of fatty acids from mono-, di-, and triglycerides, free fatty acids, phospholipid fatty acids, and sterol fatty acids. This definition includes all sources of fatty acids that provide energy, preventing underestimates of energy from total fat. It also acknowledges that certain lipid components, such as cholesterol and other sterols, do not contribute metabolizable calories and constitute only a very small amount of the total weight of lipids.

This definition represents all fatty acids obtainable from a total lipid extraction. The definition does not require that a single extraction method be used. The extraction method will depend upon the type of lipid being sought in the food and the type of food (i.e., the food matrix). Analytical procedures are discussed further in section IV. of this document.

The agency finds that this definition is more consistent with, although not identical to, international definitions for dietary fat. The Codex Alimentarius considers any source of dietary energy to be a nutrient (that would include nontriglyceride sources of fatty acids), and declaration of dietary fat would reasonably include all sources of fatty acids. The EC definition of fat is total lipids, including mono- and diglycerides and phospholipids. The difference between the EC definition and the agency's definition is that the agency excludes the sterol fraction, not a large difference in quantitative terms. Furthermore, the agency's definition reflects dietary goals for consumption of only 30 percent of calories from fat, because the sterols are not absorbed and therefore do not contribute calories.

However, the agency also recognizes that the definition of total fat as total lipid fatty acids does not account for the weight of glycerol to which the fatty acid chains are linked in the formation of mono-, di-, and triglycerides. Unless the glycerol is included in the weight of the total fat, it will be reported as carbohydrate. In this case, foods in which the fat is mostly triglyceride, e.g., corn oil and lard, will appear to have 95 percent total fat and 5 percent carbohydrate, while other products such as muscle meats which have never been reported to contain carbohydrate may now contain measurable amounts. These values would conflict with common perceptions of food composition because nutrient data bases and food composition tables routinely include the weight of glycerol in the declaration of total fat.

Therefore, the agency has decided to require that the declaration of total fat be expressed as the amount of triglyceride that would provide the analytically measured amount of total lipid fatty acids in the food. This position is supported by a recent report in The Referee, a publication of the AOAC International (Ref. 32). Likewise, because food composition data bases do not include glycerol in the declaration of fatty acids (i.e., values represent free fatty acid), the agency is not requiring that the amount of saturated fatty acids or other classes of fatty acids be expressed as triglycerides (see comment 30 of this document).

While the inclusive term "total lipid fatty acids expressed as triglycerides" would be the more accurate term to use in the nutrition label, the agency will continue to require use of the term "total fat" to be consistent with the terminology used in dietary recommendations and to avoid consumer confusion.

17. Several comments from manufacturers, trade associations, a consumer advocacy group, and a research firm addressed the issue raised in the preamble to the supplementary proposal (56 FR 60366 at 60371) of the increased use of fats containing very long (longer than 18 carbons) chain fatty acids in the food supply. These compounds provide the potential for marketing novel compounds in which fatty acids are linked to carbon structures in a manner that reduces their digestibility. As a result, these compounds have the technical effect of fat with less calories than traditional fats.

Comments requested that fat be defined to exclude various types of very long chain fatty acids because of their poor absorbability and reduced digestibility. A recent article was cited as evidence of the poor absorption of the very long chain fatty acids (Ref. 33). One comment stated that the definition of fat should exclude extractable compounds that do not have the physiological effects of fatty acid compounds. Two comments suggested the omission of these fatty acids from fat and calorie declarations similar to the omission of insoluble dietary fiber from calorie declarations. According to these comments "total fat" should be defined as "total 'digestible' fat" to allow for the use of fat-type ingredients that have reduced digestibility and therefore fewer calories than the fats they replace. The declared amount of fat would then be the total analytically determined fat times the fat digestibility coefficient.

FDA acknowledges the effect that the use of certain very long (longer than 18 carbons) chain saturated fatty acids with reduced digestibility have on the fat and calorie content of foods. In an effort to encourage innovation in the creation of products that provide lower fat and lower calorie contents to enable the consuming public to have a healthier diet and thus to meet one of the primary objectives of the Surgeon General's report on Nutrition and Health (Ref. 2), the agency is willing to consider the digestibility of novel fat compounds. However, the agency has concluded that because of the diversity of possible products, it is not appropriate to modify the definition of total fat in § 101.9(c)(2) to allow for alternate values because of reduced digestibility of very long chain fatty acids. Rather, the agency will address the digestibility of new ingredients containing these fatty acids on a case-by-case basis.

Because the digestibility of a substance is one of the identifying characteristics of the substance, the agency requests that manufacturers who wish to declare adjusted values of total fat based on reduced digestibility include information on the digestibility of the compound, analytical assay procedures for the compound, and data on interference with required methods of analysis in food additive petitions (21 CFR part 171) or in petitions for affirmation that the use of the substance is GRAS (21 CFR 170.35). The agency will include the specific digestibility coefficients that can be used in determining the quantitative declaration of fats and the caloric contribution from fats as part of the statement of identity for the substance in the listing regulation in part 172 for food additives and in part 184 for substances whose use is affirmed as GRAS. However, FDA recognizes that mechanisms other than food additive or GRAS petitions may be appropriate to bring issues involving the digestibility of a substance to the attention of the agency. Interested persons may wish to use the mechanism in § 101.9(g) to request to use specific digestibility coefficients.

18. Several comments said that there is a need for adequate analytical methods for assaying novel forms of fat in new low-fat foods. They noted the difficulty of isolating new ingredients by the traditional or AOAC determinations for fat. As one comment stated, the current acid hydrolysis analysis may not be appropriate for these type of substances.

FDA agrees with the concern about analytical methodology and is aware that different methods might be needed for each product or type of product. Because of this concern, and as noted in the preceding comment, the agency

finds that it is necessary that manufacturers delineate, in the documentation submitted to FDA in support of the lower fat content declarations, the methodology needed to assay for the novel fat compound. Use of the method by the manufacturer and the agency in lieu of conventional methods found in the AOAC or other recognized sources should alleviate labeling compliance concerns.

19. One comment urged the agency to allow manufacturers to use calculations from product formulas to arrive at the calorie or fat content of products containing these alternate ingredients.

As discussed in previous comments, the supporting documentation submitted to the agency to substantiate different caloric levels for novel fats should contain adequate information regarding the digestibility coefficient, analytical methodology, and other factors to ascertain an accurate label value for the fat and calorie declarations. FDA will use the information and analytical methodology for each such fat to determine whether the values for fat and calories stated on the label are correct. Manufacturers may use other methods, such as calculations from product formulas, to determine fat and calorie values if they have a reasonable basis on which to believe that the values so obtained will be consistent with values determined analytically. However, they do so at the risk that FDA will disagree.

2. Saturated Fat

a. *Definition.* FDA proposed (55 FR 29487 at 29495) to make the amount of fat, saturated fatty acids, and cholesterol mandatory elements of nutrition labeling. At the same time, FDA proposed in § 101.9(c)(4)(i) to continue to define saturated fatty acids as the sum of lauric (C12:0), myristic (C14:0), palmitic (C16:0), and stearic (C18:0) acids, the major saturated fatty acids in the U.S. food supply. FDA requested comments on the questions of what fatty acids should be considered as saturated fatty acids, and on what basis these decisions should be made (55 FR 29487 at 29495).

20. Many comments, including comments from food manufacturers and distributors, trade associations, professional organizations, nutritionists, and state health departments agreed with FDA's proposal to include only the four saturated fatty acids with 12 to 18 carbons (lauric, myristic, palmitic, and stearic acids) in the definition of saturated fat for labeling purposes. The reasons given included: (1) Lauric, myristic, palmitic, and stearic acids comprise the vast majority of saturated fatty acids in the American diet; (2) C12:0–C16:0 fatty acids raise total and low density lipoprotein (LDL)-cholesterol; (3) although some clinical and metabolic evidence suggests that C18:0 fatty acid (stearic acid) does not have the same blood total and LDL-cholesterol-raising effect as C12:0–C16:0 saturated fatty acids, the effect of C18:0 on blood total and LDL-cholesterol is not conclusive enough to warrant deletion of C18:0 from the definition; (4) stearic acid may be associated with other risk factors of cardiovascular disease such as thrombosis and platelet aggregation; and (5) a separate analysis for stearic acid would be costly.

Many other comments, including comments from other food manufacturers, trade associations, and health professionals, suggested that FDA include only lauric acid (C12:0), myristic acid (C14:0), and palmitic acid (C16:0) in the definition of saturated fat for labeling purposes. These comments stated that there is no evidence that stearic acid has a cholesterol-raising effect, and that the postulated role of stearic acid in thrombosis is open to dispute. With regard to the latter point, the comments cited the conclusion of a workshop on Dietary Fatty Acids and Thrombosis that there is no direct evidence of a prothrombotic effect of long chain fatty acids (e.g., C18) in humans (Ref. 34).

One comment from a trade association suggested that FDA not include palmitic acid in the definition of saturated fat because palmitic acid does not raise blood total and LDL-cholesterol. The comment cited recent research articles (Refs. 35 and 36) as the evidence.

A comment from a major food manufacturer suggested that FDA not include saturated fatty acids with less than 10 carbons in the saturated fat category. Other comments suggested FDA exclude lauric acid or myristic acid from the saturated fat category for labeling purposes. The reasons given were: (1) That the medium chain fatty acids (C6:0–C10:0), lauric acid (C12:0), and myristic acid (C14:0) are readily absorbed and oxidized and may not raise blood total and LDL-cholesterol, and (2) that medium chain fatty acids are minor sources of saturated fat in the American diet. In contrast, a consumer and a state agency suggested that FDA include saturated fatty acids with carbon numbers less than 12 in the saturated fat category because they may elevate blood cholesterol.

Some comments from a major food manufacturer and a state public health department stated that saturated fatty acids with carbon chains longer than 18 (i.e., C20–C24) should not be categorized as saturated fatty acids. The reasons given included: (1) These fatty acids compose a small part of saturated fat content in the U.S. diet, and (2) these fatty acids are poorly absorbed, have no or little physiological effects, and therefore do not contribute to heart disease.

Several comments, from a food manufacturer, a consumer, and foreign governments, suggested that FDA use a chemical definition of saturated fatty acids for labeling purposes. Two other comments from the meat industry suggested that FDA use a chemical definition if it is not possible to set a definition on the basis of the relationship of saturated fatty acids to the risk of cardiovascular disease. The reasons included in these comments were:

(1) Underrepresentation of the content of saturated fat. Several comments stated that the proposed definition, limiting saturated fat to only the four saturated fatty acids with 12 to 18 carbons, would result in underrepresentation of the saturated fatty acid content of foods, particularly of those foods that contain significant amounts of saturated fatty acids with less than 12 carbons or more than 18 carbons. They further stated that this underestimation of saturated fat contradicts the current dietary recommendation that Americans consume less than 10 percent of calories as saturated fats. The examples that they presented of foods in which the definition of saturated fat as C12–C18 would underrepresent saturated fat were milk, underrepresented by 8 percent; coconut oil, by 14 percent; and palm kernel oil, by 7.2 percent.

(2) Oversimplification. A consumer stated that FDA's proposal is an oversimplification and suggested that all saturated fatty acids be included.

(3) International harmonization. The Canadian Government and the EC stated that FDA's proposal to restrict the definition of saturated fat to only lauric, myristic, palmitic, and stearic acids is at variance with the Codex Alimentarius Commission, EC, and Canadian definitions. They stated that the proposed deviations from international definitions present serious problems for food companies in the EC and would be confusing for consumers. They suggested that FDA include all saturated fatty acids without double bonds in the saturated fat definition. A major food manufacturer also stated that it already had encountered minor problems with different definitions in labels for Canada and the United Kingdom and suggested that FDA consider international

harmonization in its decision on the definition of saturated fat.

FDA is persuaded by the comments that there is substantial controversy regarding the inclusion or exclusion of specific fatty acids in a definition of saturated fat that is based on effects on blood total and LDL-cholesterol.

Therefore, the agency has reconsidered its position of linking the definition of saturated fatty acids to effects of particular fatty acids on blood total and LDL-cholesterol levels and has determined that a chemical definition is appropriate for the following reasons.

First, a chemical definition avoids much of the controversy regarding the blood cholesterol effects of palmitic acid, very long (longer than 18 carbons) chain fatty acids, and short and medium chain fatty acids, because the definition is not subject to changes in knowledge about the physiologic effects of particular fatty acids. The chemical definition also avoids uncertainties about physiologic effects other than those regarding blood total and LDL-cholesterol, such as effects on thrombosis, and other possible health effects of very long chain, medium chain, and short chain saturated fatty acids.

Secondly, FDA agrees that the amount of saturated fat in some foods could be underrepresented when the definition of saturated fat is confined to the sum of four fatty acids. This underreporting of saturated fat may be increased as new foods containing saturated fatty acids less than C12 and more than C18 appear in the marketplace.

Thirdly, the agency also notes that the chemical definition is in line with EC and Canadian definitions of saturated fat and, hence, will promote international harmonization.

Finally, the agency notes that the chemical definition of saturated fat is more consistent with dietary recommendations to reduce fat consumption to 30 percent of calories and saturated fat consumption to less than 10 percent of calories. Food composition data tables have generally been used in epidemiologic investigations that relate diet to risk of chronic diseases, and these tables group all the chemically defined saturated fatty acids together as a class. Thus, the term "saturated fat" used in these dietary recommendations pertains to the chemical classification of fatty acids, not FDA's current, more restricted definition.

Accordingly, FDA has amended § 101.9(c)(4)(i), redesignated as § 101.9(c)(2)(i), to define saturated fat as the sum of all fatty acids containing no double bonds.

b. *Voluntary declaration of specific saturated fatty acids.* 21. Some comments specifically requested that the agency provide for labeling that distinguishes those fatty acids associated with increased blood total and LDL-cholesterol levels from those not associated with increased cholesterol. One approach that was identified in the comments and in a published commentary (Ref. 13) would allow a declaration of "cholesterol-raising fatty acids," so that a manufacturer could show that a particular food contained little or none of these fatty acids.

The agency recognizes that there is substantial uncertainty as to which saturated fatty acids are cholesterolemic and which are not. Conclusions of authoritative documents and review papers are not consistent on this issue (Refs. 2, 3, 37 through 41). The effects of most individual saturated fatty acids on blood total and LDL-cholesterol are not fully understood. The agency finds that the only saturated fatty acid that has been consistently reported as cholesterol-raising is myristic acid. The effects of palmitic acid and lauric acid are not as clearly associated with increased blood cholesterol, although the prominence of palmitic acid in the diet makes any contribution of this fatty acid important in the control of blood cholesterol. On the other hand, it has consistently been reported that stearic acid, when substituted for other saturated fatty acids in the diet, has a neutral effect on blood total and LDL-cholesterol concentration (Refs. 37 through 40). As a result, the agency is concerned that there is not an adequate basis for deciding which fatty acids should be included in the term "cholesterol-raising fatty acids."

In addition, the agency is concerned that the term "cholesterol-raising fatty acids" will be confusing to consumers. Since consumers are unfamiliar with the term "cholesterol-raising fatty acids," there is a possibility that they would misinterpret it and would avoid foods with such a declaration on the nutrition label, even if the intent of the labeling was to indicate the absence of these fatty acids. Also, given that the only fatty acid declaration the agency is requiring is saturated fat (defined as the sum of all saturated fatty acids), any added declaration of "cholesterol-raising fatty acids" would be on a voluntary basis. Under these circumstances, manufacturers could be expected to only include this declaration when the level of such fatty acids is low to emphasize the absence of such components from the product.

A variation of this term that avoids the negative connotation and applies positively to the composition of the product is the term "noncholesterol-raising fatty acids." However, this term suffers from the other problems with respect to cholesterol-raising fatty acids (i.e., the scientific uncertainty concerning what fatty acids to include and the likelihood of increased consumer confusion).

FDA is also concerned that either of the terms "cholesterol-raising fatty acids" or "noncholesterol-raising saturated fatty acids" could be seen as a health claim. Section 403(r)(1) of the act states that information that is required or permitted under 403(q) of the act to be included in the nutrition label is not a nutrient content or health claim. Because of the relationship between fatty acids and increased blood cholesterol and, thereby, heart disease, however, the agency is concerned that the use of either of the subject terms goes beyond the factual reporting of nutrients that is characteristic of the nutrition label.

For the reasons enumerated above, FDA has concluded that it is not appropriate to distinguish among fatty acids by the terms "cholesterol-raising fatty acids" or "noncholesterol-raising saturated fatty acids."

Another approach to distinguishing among fatty acids is to declare specific saturated fatty acids without any reference to effects on blood total and LDL-cholesterol. This approach is consistent with the agency's intention of providing factual information on the nutrition label. Because some comments strongly opposed the inclusion of stearic acid in the declaration of saturated fat because of the consumer's association of saturated fat with increased blood cholesterol levels, it is reasonable to indicate the extent of the saturated fat content of the food that is stearic acid and, thus, not associated with increased blood cholesterol. As noted above, a consensus that seems to be emerging is that stearic acid, when substituted for other saturated fatty acids, does not raise or lower blood total and LDL-cholesterol level. Consumer education programs could advise consumers that when a large portion of the saturated fat in a product consists of stearic acid, the fat content of the food is not likely to increase blood total and LDL-cholesterol levels.

The agency, however, has some reservations about allowing for the voluntary labeling of stearic acid in that: (1) Other saturated fatty acids that may raise blood total and LDL-cholesterol are not addressed; (2) only one risk factor of cardiovascular disease, blood

cholesterol level, is addressed; (3) it may complicate and overcrowd the label; and (4) it would require a consumer information program to have any meaning to consumers.

In addition, recognizing particular saturated fatty acid effects on blood cholesterol may require that the agency redefine the saturated fat threshold criterion for cholesterol claims in § 101.62(d) (cholesterol claims are not allowed on foods containing more than 2 g saturated fat, defined as the sum of all fatty acids containing no double bonds, per serving), as described in a companion document on nutrient content claims published in this issue of the **Federal Register.** Because of the agency's reservations about the meaningfulness of labeling of individual fatty acids and the need to reconsider criteria for cholesterol claims if such action was to be taken, the agency concludes that more information, including public comment, is necessary before taking further action on this approach. The agency intends to further address this issue at a later date, and would welcome submission of information and views on this question.

3. Polyunsaturated and Monounsaturated Fat

a. *Use of the term "unsaturated fat".* FDA proposed in both the July 19, 1990, and November 27, 1991, documents in § 101.9(c)(4)(ii) to permit the voluntary declaration of the quantitative amount of unsaturated fat in nutrition labeling. The agency proposed to make the declaration of unsaturated fat mandatory if claims were made about fatty acid or cholesterol content or if the manufacturer voluntarily declared the number of calories from unsaturated fat. Alternatively, the agency proposed to allow separate declarations of polyunsaturated and monounsaturated fats.

22. The agency received comments that either agreed or disagreed with the proposed definition and voluntary use of the term "unsaturated fat". Comments that supported the use of the inclusive term did so because neither monounsaturated nor polyunsaturated fats have been shown to increase the risk of coronary heart disease, and because both types of unsaturated fats decrease the risk of coronary heart disease relative to saturated fat.

Comments objecting to the term "unsaturated fat" argued that the term is not useful, that it offers no additional information that could not be obtained by subtracting the saturated fat content from total fat, and that it obscures the presence of essential fatty acids. Other comments were concerned that the term was misleading in that it suggests that all unsaturated fats are synonymous by including both *cis* and *trans* isomers and both poly- and mono-unsaturated fats together. These comments argued that in light of the current uncertainty and controversy surrounding the physiological effects of *trans* fatty acids (which are a particular type of unsaturated fatty acid having some physical properties of saturated fatty acids), use of the term "unsaturated fat" would not only be misleading to the consumer but possibly could have an adverse effect on the health of some individuals. This opposition to the inclusion of *trans* isomers in the definition of "unsaturated fat" was the most frequently repeated concern.

Comments suggesting that it would be misleading to group poly- and mono-unsaturates together argued that this action would imply that the two types of fatty acids are the same and have similar effects on blood total and LDL-cholesterol when, in fact, they do not. It has been reported that monounsaturates do not effect blood total and LDL-cholesterol levels and do not reduce high density lipoprotein-cholesterol when substituted for saturated fats. On the other hand, polyunsaturates have often been reported to reduce blood total and LDL-cholesterol levels and to decrease blood pressure.

A few comments suggested that if the term "unsaturated fat" is permitted, the declaration of the *cis* forms of polyunsaturates and monounsaturates should either be permitted or required at the same time. Comments also argued that there is no scientific consensus supporting the use of the inclusive term, and that it was not a term used in international trade.

FDA is persuaded by these comments that the use of the term "unsaturated fat" is potentially confusing to consumers, does not provide useful information, and could result in consumer deception. Accordingly, the agency is revising the regulation by not providing for the voluntary declaration of unsaturated fat in nutrition labeling. As a result, the proposed listings of polyunsaturated fat and monounsaturated fat in § 101.9(c)(4)(ii)(A) and (c)(4)(ii)(B), respectively, are redesignated as § 101.9(c)(2)(ii) and (c)(2)(iii). In addition, each paragraph has been modified to incorporate provisions that had been included in proposed § 101.9(c)(4)(ii). The revised listings provide that the disclosure of the level of polyunsaturated fat and monounsaturated fat is voluntary unless claims are made on the label about fatty acid or cholesterol content, and that, if either polyunsaturated or monounsaturated fat is declared, the other must also be declared.

b. *Trans Fatty Acids.* In its July 19, 1990 proposal on mandatory nutrition labeling (55 FR 29487 at 29496), the agency tentatively concluded that there is no basis for declaring *trans* isomers of fatty acids on the nutrition label. This conclusion was based on a consensus report that noted that current evidence does not support a blood cholesterol-raising effect for *trans* isomers when they are substituted for saturated fatty acids in the diet. The agency requested comments on this issue. Later that year new research and commentary was published (Refs. 12 and 13) which led FDA to request in the supplementary proposal (56 FR 60366 at 60371) comments on the significance of the new findings and a reevaluation of any comments submitted on *trans* fatty acids in response to the July 19, 1990 proposal.

23. Several comments, from a major food manufacturer, health professionals, a professional health organization, a state agency, a trade association, and a consumer, suggested that FDA include *trans* fatty acids in the saturated fat category because research suggests that *trans* fatty acids raise blood total and LDL-cholesterol. On the other hand, several comments were against the inclusion of *trans* fatty acids in the saturated fat category because the evidence of a cholesterol-raising effect of *trans* fatty acids is not conclusive. Several comments suggested that *trans* fatty acids should be declared separately because it may increase blood cholesterol.

FDA disagrees that there is sufficient evidence that indicates that *trans* fatty acids raise blood total and LDL-cholesterol. In 1985, a report of the Federation of American Societies for Experimental Biology on "Health Aspects of Dietary *trans* Fatty Acids"(Ref. 42) concluded that human studies indicate that *trans* isomers are little, if any, more cholesterolemic than *cis* isomers. In animals (rabbits, swine, and monkeys), *trans* fatty acids are cholesterolemic but not atherogenic. Since the publication of the Federation of American Societies for Experimental Biology report, a scientific review article, (Ref. 40) concluded that reports are inconsistent regarding the effects of *trans* unsaturates on blood total and LDL-cholesterol levels in humans.

Recently, two studies in The Netherlands (Refs. 12 and 43) have shown that a high intake of *trans* fatty acids may elevate blood total and LDL-cholesterol concentration. Concerns

have been raised about the applicability of these studies to U.S. diets because of certain methodologic limitations, because the level of *trans* fatty acid tested was 2–3 times higher than the current average consumption of the U.S. population, and because the methods for generating *trans* fatty acids might have been different from those used in the United States.

In contrast, another study (Ref. 44) seems to indicate that *trans* fatty acids do not raise blood total and LDL-cholesterol in mildly hypercholesterolemic, normotensive men, although diet differences other than *trans* fatty acids may have been responsible for the effects.

Finally, the agency is aware of preliminary results from a very recent unpublished study designed to address the criticisms of the studies from The Netherlands (Ref. 45) that suggests that *trans* fatty acids raise LDL-cholesterol.

In the absence of the fully analyzed data from this study, the agency considers it premature to require the labeling of *trans* fatty acids because of their effects on total or LDL-cholesterol. However, even if there was a need for labeling of *trans* fatty acids, the agency does not agree that *trans* fatty acids should be included in the category of saturated fats. The agency has argued against inclusion or exclusion of particular saturated fatty acids in the definition of saturated fat solely on the basis of their effect on blood total and LDL-cholesterol. In addition, the agency recognizes that inclusion of *trans* fatty acids in the definition of saturated fat is not consistent with the EC, Codex, or Canadian definitions of saturated fat.

Because of the current uncertainties, the agency does not agree that a separate declaration of *trans* fatty acids is appropriate at this time. Because new data are rapidly emerging (Ref. 45) that imply that *trans* fatty acids raise LDL-cholesterol, however, the agency recognizes that it may be necessary to readdress the labeling of *trans* fatty acids in the near future.

24. One comment suggested that not all foods voluntarily declaring levels of monounsaturates and polyunsaturates need to be analyzed to differentiate *cis* and *trans* fatty acids because only those containing hydrogenated fats would contain *trans* isomers.

The agency agrees with this comment in the case of vegetable oils and other plant lipids. However, naturally occurring *trans* fatty acids are found in some animal lipids (e.g., dairy products). If there is adequate and reliable reason to believe that a nutrient is not present in a food, there is no need to analyze for that nutrient. However, a manufacturer is responsible for ensuring that its labeling is truthful and not misleading.

c. *Definition of polyunsaturated fatty acids.* FDA proposed in §§ 101.9(c)(4)(ii)(A) and (c)(4)(ii)(B) in July 19, 1990 and November 27, 1991 to define polyunsaturated and monounsaturated fats as *cis, cis*-methylene interrupted polyunsaturated fatty acids and cis-monounsaturated fatty acids, respectively. These definitions exclude *trans* isomers. The definition of polyunsaturated fat is consistent with current § 101.25(c)(2)(ii)(*a*). FDA has not previously defined monounsaturated fat for labeling purposes.

25. Comments from food manufacturers, trade associations, health promotion organizations, consumer groups, and international agencies supported the agency's definition for polyunsaturated fat. However, some comments urged FDA to change the definition to reflect the various physiological roles of specific types of polyunsaturated fats, in particular to allow for the identification of omega-3 (n–3) and omega-6 (n–6) fatty acids, indicating that these are essential in the diet and that the ratio of consumption of these fatty acids can be important.

FDA is not persuaded that there is a need to require further breakdown of polyunsaturated fats in the nutrition label. As discussed above, FDA is concerned that additional information on the nutrition panel may confuse consumers and interfere with their understanding of other required information.

However, the agency agrees that there are valid reasons to consider the voluntary labeling of omega-3 and omega-6 fatty acids. These chemical distinctions are important nutritionally, because the omega-3 fatty acids (with the first double bond at the third carbon from the methyl end of the fatty acid) and omega-6 fatty acids (with the first double bond at the 6th carbon from the methyl end) are not interchangeable during metabolism in the body; rather each must be supplied by diet. Each subcategory has members that are considered essential nutrients (α-linolenic acid and linoleic acid, for the omega-3 and omega-6 classes, respectively) (Ref. 23). Dietary omega-3 and omega-6 fatty acids are precursors for biologically active compounds, e.g., prostaglandins, eicosanoids, and the nutritional balance of omega-3 and omega-6 fatty acids modulates the production of many of these biologically important substances. Furthermore, omega-3 and omega-6 fatty acids are important components of cell membranes.

Although the National Research Council has not yet established a Recommended Dietary Allowance for omega-3 and omega-6 fatty acids, they recognized in 1989 that "[T]he possibility of establishing Recommended Dietary Allowance's for these fatty acids should be considered in the near future." (Ref. 23)

FDA agrees that information on the amount of omega-3 and omega-6 fatty acids may be useful to allow interested consumers to select foods that provide these fatty acids. It is not difficult to consume a diet rich in omega-6 fatty acids because vegetable oils are rich in these fatty acids. However, vegetable oils vary widely in their content of omega-3 fatty acids, and labeling may be useful to identify those foods that contain substantial amounts of omega-3 fatty acids to encourage a balanced intake of these two classes of fatty acids.

However, FDA is not fully persuaded about the usefulness of additional label information on omega-3 and omega-6 fatty acids, and whether there are many consumers who desire this information. As discussed above, the agency is concerned that additional information on the nutrition panel may confuse consumers and interfere with their understanding of other required information. Because of these concerns, FDA concludes that it is not appropriate to allow for the voluntary declaration of these subcomponents of polyunsaturated fats at this time. The agency intends to address this issue at a later date and would welcome submission of information and views on this issue.

26. The majority of comments supported the voluntary declaration of polyunsaturated fats. However, a few comments suggested that their declaration be mandatory rather than voluntary. One of these comments was concerned with possible safety issues associated with increased consumption of polyunsaturated fats. The comment alleged that polyunsaturated fats convey a potential source of free-radical peroxidation products, and that consumers should be informed of the amounts of polyunsaturated fat present in a food. Other comments merely stated that mandatory declaration of polyunsaturated fat would provide consumers with valuable and more complete nutritional information.

FDA is not persuaded that there is a need to require the inclusion of polyunsaturated fats on the nutrition label. These fatty acids do not meet the criteria for mandatory declaration set forth in the mandatory nutrition

labeling proposal (55 FR 29487 at 29493) that the nutrient or food component be of particular public health significance, and that quantitative intake recommendations for the nutrient be given in major scientific consensus reports. The comments largely support this view, and the agency therefore rejects the suggestion that the declaration of polyunsaturated fats be mandatory.

The agency disagrees with the contention that commonly consumed amounts of polyunsaturated fats would pose any safety concerns. While the potential exists for formation of oxidative products as a result of the increased number of double bonds—present in polyunsaturated fats, any risk would only occur at very exaggerated levels of consumption.

d. *Monounsaturated fats.*

27. Comments both agreed and disagreed with the proposed definition of "monounsaturated fat." Those opposed generally requested that the definition not exclude *trans* fatty acids on the basis that they have not been proven to have an adverse effect on health or disease in humans, or that *cis* and *trans* isomers have similar metabolic and physiologic properties. One comment asked the agency to include *trans* fatty acids in the definition of monounsaturated fats until an expert panel can determine if *trans* or unusual *cis* isomers formed as components of commercial hydrogenation increase the risk for coronary heart disease or other health related conditions.

Comments from medical associations, trade associations, a consumer advocacy group, the Canadian government, and the EC supported the proposed definition, focusing particularly on two considerations. First, *trans* fatty acids or unusual *cis* isomers formed during commercial hydrogenation of unsaturated fats may increase the risk of coronary heart disease, and, second, monounsaturated fats, as defined in the proposal, may reduce blood total and LDL-cholesterol and reduce the risk of coronary heart disease. Comments also suggested that the inclusion of *trans* fatty acids may mislead consumers, who perceive monounsaturates as healthful or at least as not harmful.

FDA concludes that there is no need to amend the proposed definition of "monounsaturated fat." The comments received, the scientific reports they discuss (Refs. 12 and 43), and the concerns addressed in the preceding discussion of *trans* fatty acids establish that to include *trans* isomers in the definition of "monounsaturated fat" would be misleading and will not assist consumers in maintaining healthy dietary practices. The agency is not willing to include *trans* isomers in the label definition of "monounsaturated fat" until there is further consensus based on publicly available, well-designed, and well-conducted studies. However, as more data concerning the action and safety of *trans* fatty acids become available, the agency may reconsider its decisions to define monounsaturates as the usual *cis*-monounsaturated fatty acids.

28. One comment also objected to the proposed definition of "monounsaturated fat" because it would require manufacturers to conduct a further analysis of lipids to differentiate between *cis* and *trans* isomers. The comment argued that this extra analysis was not justified by available scientific data and would cause a financial burden.

The agency disagrees with the comment. The declaration of poly- and mono-unsaturates is voluntary. Therefore, an analysis of unsaturated isomeric forms is only required if the manufacturer chooses to declare poly- or mono-unsaturates or to make fatty acid or cholesterol claims. In such cases, given the controversy on the effect of *trans* fatty acids, the additional analysis is necessary to ensure that the declaration or claims are not misleading.

29. One comment suggested that the agency should include stearic acid in the definition of monounsaturated fat by virtue of its effects on blood total and LDL-cholesterol. The comment stated that scientific data suggests that stearic acid does not increase blood LDL-cholesterol, and that it is rapidly converted to oleic acid, an unsaturated fat that does not raise blood total and LDL-cholesterol levels.

FDA does not agree that stearic acid should be included in the definition of monounsaturated fat. Chemically, stearic acid is a saturated fat, and the agency, therefore, finds that it would be inappropriate to include it with monounsaturated fats. The agency has acknowledged above that some studies and some consensus statements suggest that stearic acid does not increase LDL-cholesterol relative to other saturated fats. However, stearic acid does increase LDL-cholesterol relative to monounsaturates and polyunsaturates (Refs. 12 and 43). Accordingly, the agency is not including stearic acid in the definition of monounsaturated fat.

4. General Issues Related to Declaration of Fats and Fatty Acids

a. Calculation of fatty acids as triglycerides.

30. A comment was received that disagreed with proposed § 101.9 (c)(4)(i) and (c)(4)(ii), which would require saturated fat and unsaturated fat content to be calculated as triglycerides. The comment noted that values in current data bases are reported as the free fatty acids.

Current § 101.25(c)(2)(ii) requires that fatty acids be calculated as triglycerides. This requirement dates back to the initial nutrition labeling regulation promulgated in 1974. This requirement was a result of comments from industry at that time.

To provide consumers with nutrition information that can readily be used for comparison to available nutrient data bases, FDA agrees that saturated and poly- and mono-unsaturated fat should be declared as free fatty acids instead of as triglycerides. As a consequence of the change in method of reporting, slightly lower values for the various fatty acid declarations will appear on the label because the weight of the glycerol molecule in triglycerides is not included when free fatty acids are declared. Also, fatty acids from mono- and di-glycerides used as a source of fat in many products will be included using this revised means of reporting fatty acids. Accordingly, FDA is amending § 101.9(c)(2)(i) for saturated fat and § 101.9(c)(2) (ii) and (iii) for polyunsaturated and monounsaturated fat, respectively, to remove the requirement that the fatty acids be "calculated as triglycerides."

b. Increments for declaring fats and fatty acids. The mandatory nutrition labeling proposal retained the current requirement for the declaration of fat in g and added, as a requirement, the amount of saturated fatty acids in g (55 FR 29487 at 29495). In the supplementary proposal, FDA proposed to change the increments for declaring fats and fatty acids (56 FR 60366 at 60380). The agency proposed to require the declaration of total fat, saturated fat, unsaturated fat, polyunsaturated fat, and monounsaturated fat in 0.5 (½)-g increments. The agency made this change in the proposed provisions to make the increments in which these nutrients are declared more consistent with the levels at which these substances will have nutritional significance. FDA believed the proposed change would consequently provide consumers with more precise information and a greater ability to discriminate among products. In this context, a level of less than 0.25 g per serving was established as the level at which saturated and unsaturated fat content would be expressed as zero.

31. Over 25 responses concerning fat increments were received in response to the request for comments. Almost twice the number of comments disagreed with the proposal to declare total fat and fatty acids in 0.5-g increments as those who agreed with the proposal to do so. The rationale given by essentially all who disagreed with the proposed change was the lack of analytical methods that are adequate and sensitive enough to provide data to that degree of precision. Several comments recommended that the fat content of foods containing 3 or less g fat be declared in 0.5 (½)-g increments, and the fat content of foods containing more than 3 g be declared in whole g increments. These comments suggested that the precision of 0.5 g increments for fat declarations is less important for higher fat foods. Additionally, these comments stated that the variability of some fat assays warrants whole-g increments, especially for moderate and high levels of fat. It should be noted, however, that several comments stated that methodology does exist to support the 0.5-g increment declaration. One comment noted the desirability of keeping all macronutrients, including fat, in whole-g increments. Several comments cited the cost of assaying to the 0.5 (½)-g level of precision as a reason for retaining the whole-g increment declarations for these nutrients.

FDA has given careful consideration to the comments. The agency recognizes that labeling requirements must not only convey desired nutrition information for the consumer but must also be enforceable. Because of concerns about analytical precision, variability, and the effect of product matrices on the methods necessary to quantify total fat, saturated fat, and poly- and mono-unsaturated fat declarations in 0.5-g increments, FDA has concluded that such precision is not necessary for amounts of fat above 3 g per serving of food. Consequently, the agency is modifying § 101.9(c)(2) and (c)(2)(i) through (c)(2)(iii) to require that levels below 3.0 g per serving be declared in 0.5 (½)-g increments and levels above 3.0 g be declared in g increments.

The agency disagrees that cost, although a factor, is a sufficient reason in and of itself to retain the current whole-g increments for total fat, saturated fat, and poly- and mono-unsaturated fats. The public health benefits attributed to decreasing dietary intakes of fat (Refs. 2, 3, 4, and 47) justify the use of 0.5-g increments to allow consumers to differentiate between products containing low levels of fats.

32. A few comments urged that fats not be declared in 0.5 (½)-g increments to improve the legibility of the label.

The agency is concerned about the legibility of the label. However, because of the public health significance of dietary intake of fats, FDA believes it is important to provide the increased precision at low levels of fat. Inasmuch as legibility is more dependent upon factors such as type size and color contrast than the addition of a decimal point and digit, FDA urges manufacturers to consider the readability factor and use great care to ensure that the information is legible.

33. Two comments requested that the agency permit the declaration of total fat and saturated fat in tenths of a g.

FDA does not agree. It is not possible to require the declaration of total fat and saturated fat in tenths of g increments because this degree of precision cannot be reliably obtained in all foods with available methodology.

34. Comments stated that the change from whole-g increments would be confusing and cumbersome to consumers. One comment requested that the agency adopt a consistent rule for all macronutrients by rounding values to the nearest g.

FDA does not agree that the use of different increments for different nutrients will be confusing and cumbersome. These final rules allow for calories to be declared to the nearest 5 or 10 calorie increment depending on amount, for fats to the nearest 0.5 (½) or whole g, for cholesterol to the nearest 5 milligram (mg) amount, for carbohydrates and protein to the nearest g and for sodium to the nearest 5 or 10 mg increment. The rationale for each of these increments was explained when the increments were proposed.

c. *Amounts of fatty acids to be rounded to zero.*

35. A few comments disagreed with 0.25 g as the cut-off level at which fatty acids could be declared at zero. The primary reason given for disagreeing with the 0.25 g cut-off was that the analytical methods are not sensitive and precise enough to detect that level with any degree of reliability. One of the comments noted that FDA had, in its proposal on serving sizes, referenced consumer complaints about fractional numbers. The comment felt it was contradictory to introduce a potentially confusing requirement for the proposed 0.25 g cut-off. Other comments stated it would be confusing to consumers if, because of the rounding requirements, a product containing either 0.4 g or 0.45 g total fat and 0.3 g saturated fat is declared as "0" g total fat and 0.5 g saturated fat.

The agency is persuaded that the level of 0.25 g as the cutoff for a zero declaration for saturated, polyunsaturated, and monounsaturated fat content implies unwarranted precision. The ability to distinguish 0.24 g as zero and 0.26 g as a 0.5 g increment is presently unsubstantiated. Therefore, FDA is amending § 101.9(c)(2)(i) through (c)(2)(iii), to require that when a serving contains less than 0.5 g of saturated fats, polyunsaturated fats, or monounsaturated fat, the content of the fatty acids will be expressed as zero.

5. Cholesterol

36. The majority of comments agreed with the proposal for the mandatory declaration of cholesterol content. A few comments disagreed stating that dietary cholesterol does not play a significant role in the etiology of atherosclerotic vascular disease. Some comments stated that the declaration of cholesterol would mislead consumers into believing that a food free of, or low in, cholesterol would be effective in lowering serum cholesterol levels no matter how much saturated fat or total fat it contained. These comments suggested that declarations of cholesterol content should be either voluntary or not permitted.

FDA disagrees that the declaration of cholesterol should be voluntary or not permitted. The declaration of cholesterol content is required by section 403(q)(1)(D) of the act. While section 403(q)(2)(B) of the act allows the Secretary to delete nutrient information that is not necessary to assist consumers in maintaining healthy dietary practices, FDA does not believe that this is the case for cholesterol. There is a strong scientific consensus that high dietary intakes of total fat, saturated fatty acids, and cholesterol are associated with an increased risk of atherosclerotic cardiovascular disease, most notably with elevations in blood LDL-cholesterol and increased risk of coronary heart disease (Refs. 2, 3, 4, and 30).

Further, numerous controlled experiments, in both animals and humans, verify that dietary saturated fats and cholesterol elevate blood LDL-cholesterol. For this reason, current recommendations suggest limiting cholesterol to 300 mg per day as a means of lowering blood LDL-cholesterol and thereby reducing the risk of atherosclerotic vascular disease (Refs. 2, 3, 30, and 48). Accordingly, the agency concludes that the declaration of cholesterol is warranted and will be beneficial to many individuals in the general population in the monitoring of their cholesterol intake. Therefore, no

changes have been made in § 101.9(c)(5), redesignated as § 101.9(c)(3).

37. A few comments requested the mandatory declaration of a cholesterol-saturated fat index. This index provides a single number for individual foods that describes their cholesterol and saturated fat content. The index indicates the potential of a given food, diet, or menu to raise blood cholesterol levels.

The agency is not persuaded that the declaration of a cholesterol-saturated fat index on the nutrition label is warranted. There currently exists no consensus on the efficacy of this index. Therefore, FDA believes that the declarations of cholesterol and saturated fat, as required by the 1990 amendments, are sufficient for those who wish to moderate their intake of these nutrients.

38. Several comments disagreed with the proposal to declare "not a significant source of cholesterol" if cholesterol is present at less than 2 mg per serving. One comment suggested that the label declare zero cholesterol only if the product is virtually devoid of cholesterol. The comments stated that it is misleading to have even minute quantities of a food component in a product when the label declares that the product is free of that component.

The agency is not persuaded by these arguments. As discussed in the July 19, 1990, tentative final rule on cholesterol (55 FR 29460 at 29461), FDA purposely selected a value, less than 2 mg of cholesterol per serving, that is dietarily insignificant yet that can be detected with reasonable analytical reliability. A quantitative declaration other than zero would not necessarily be more correct because methodological limitations do not generally permit precise quantification of cholesterol content within the 95 percent confidence level below 2 mg amounts. It is also extremely unlikely that sufficient quantities of foods containing less than 2 mg of cholesterol per serving would be consumed on a daily basis to represent a significant level of cholesterol intake.

39. A few comments requested that foods having less than 5 mg of cholesterol per serving be permitted to indicate "not a significant source of cholesterol" so that skim milk, at 4 mg cholesterol per cup, and similar foods could use the statement. Proposed § 101.9(c)(5) only allows its use on labels of foods containing less than 2 mg of cholesterol per serving.

FDA disagrees. The agency believes that the statement "not a significant source of cholesterol" is only appropriate on foods that contribute truly insignificant amounts of cholesterol to the diet. In the companion document on nutrient content claims published elsewhere in this issue of the **Federal Register**, the agency has determined that foods that contain less than 2 mg of cholesterol per serving are dietarily insignificant sources, and that foods that contain larger amounts, both individually and collectively, contribute significantly to a person's daily cholesterol intake. Therefore, FDA is taking no action on the basis of these comments.

D. Sodium

40. The majority of comments supported the proposal for the mandatory declaration of sodium. A few comments requested alternate methods of declaring sodium, such as a sodium to potassium ratio and a sodium balance system.

The agency has no data, nor were any submitted, that demonstrate that these alternative methods would more effectively present sodium content. Accordingly, FDA has not revised the provision for the declaration of sodium content.

41. A few comments questioned potential beneficial effects of sodium restriction in nonhypertensive populations. The comments suggested that there is still debate within the scientific community as to whether it is appropriate for the general population to reduce its overall sodium consumption. Further, these comments stated that control of sodium intake is only relevant for those segments of the population that are sodium sensitive. These comments requested that the agency not permit the declaration of sodium, or that it make the declaration of sodium voluntary.

The agency disagrees. Section 403(q)(1)(D) of the act requires the declaration of sodium. While section 403(q)(2)(B) of the act allows the Secretary to delete nutrient information that is not necessary to assist consumers in maintaining healthy dietary practices, the bulk of the accumulated evidence strongly supports the prevailing consensus that it would be prudent for the general population to reduce sodium consumption, even though not all people display increased blood pressure in response to high sodium intakes.

The Surgeon General's report (Ref. 2) asserts the need for moderation in sodium consumption, not only because there is a benefit to persons whose blood pressures do rise with sodium intake, but also because there is no biological marker for individual sodium sensitivity. Additionally, the report notes that there is no apparent harm from moderate sodium restrictions (Ref. 2). Accordingly, § 101.9(c)(9), redesignated as § 101.9(c)(4), will continue to require sodium declaration.

42. One comment from a national manufacturer of carbonated soft drink syrups explained that these syrups must be mixed with local water supplies, and that, therefore, the final products vary in sodium content. The comment suggested that the sodium in these products be declared as an average value, such as "less than 35 mg," even though the product contains slightly more, or slightly less, than that amount. Further, the comment suggested that the manufacturer be allowed to make a claim, such as "very low sodium," based on that range.

Data on the sodium content of the United States water supplies were previously submitted, reviewed, and discussed in the April 18, 1984, final rule on the declaration of sodium content (49 FR 15524). FDA's evaluation of these data revealed that a single label would accurately reflect the sodium content of all but 10 percent of soft drink products bottled in the United States, and that a second label could apply to the remainder without severely overstating the sodium content.

Further, the agency stated that the manufacturer had the option of using a single nationwide label with the highest possible sodium level declared. This approach would result in the sodium content being overstated by about 50 mg for a majority of products. While 50 mg is not an insignificant amount of sodium, it represents a relatively small portion of the daily sodium intake for all but those persons on extremely restricted sodium diets. Even if sodium were declared based on the highest level of sodium found in any source of water, all regular and diet soft drinks would fall into the "low sodium" category.

FDA is not persuaded by the comment to the July 19, 1990 or November 27, 1991, proposals that an average value representing a range of sodium levels, such as "less than 35 mg," is appropriate for these products. Sodium content may be underrepresented by this method.

Inasmuch as the declaration of sodium is required by section 403(q)(1)(D) of the act, and no new data were presented with the comment, the agency is denying the request that a range of sodium content be declared on the nutrition label or be allowed as a basis to support a nutritional claim.

E. Potassium

43. Several comments supported the proposal for the voluntary declaration of potassium. One comment, however,

requested that the agency not allow any declaration of potassium content. The comment suggested that the general population is unaware of the dietary role of potassium, and any declaration of potassium content would only serve to confuse the consumer. No data were provided to support this argument.

FDA is not persuaded that it should not permit the voluntary declaration of potassium content. As discussed in the mandatory nutrition labeling proposal (55 FR 29500 at 29501), beneficial effects of potassium intake relative to reducing mortality from stroke have been reported. Data from animal studies suggest that dietary potassium may lower blood pressure and the risk for heart disease and may also protect against vascular damage and stroke (Ref. 3).

In addition, epidemiological evidence for humans suggests that diets with high levels of potassium—but also low levels of sodium—may be beneficial in lowering blood pressure (Ref. 3). Moreover, the IOM report concluded that even though deficits or excesses of potassium intake do not pose public health concerns, the voluntary declaration of potassium would be beneficial to consumers (Ref. 1). Based on the foregoing evidence, FDA concludes that the declaration of potassium in nutrition labeling may assist in maintaining healthy dietary practices. Accordingly, in § 101.9(c)(10), redesignated as § 101.9(c)(5), FDA will allow potassium to be declared in nutrition labeling on a voluntary basis.

44. Comments from several health and professional associations, consumers, consumer groups, and universities supported mandatory declaration of potassium content. The comments stated that this information is potentially helpful to persons with kidney disease. Others referred to epidemiological evidence of a positive association among high potassium intake, low sodium intake, and lower blood pressure.

Although potassium has been acknowledged as a potential public health issue (Refs. 1 and 49), no specific, quantitative recommendations have been made by national consensus reports. Accordingly, potassium does not meet FDA's criteria for inclusion as a mandatory element of nutrition labeling, as discussed in FDA's mandatory nutrition labeling proposal (55 FR 29487 at 29493 and 29500).

Until such time as quantitative recommendations are made, the agency does not believe there are sufficient grounds to require labeling of potassium content. Therefore, FDA is continuing to permit potassium content labeling in nutrition labeling on a voluntary basis in § 101.9(c)(5).

45. One comment suggested that the declaration of potassium content should be mandatory only if magnesium is not required as a reference nutrient. The comment stated that potassium and magnesium are abundant in whole grain cereals, legumes, nuts, and other unprocessed foods. Further, the comment suggested that if magnesium is required, potassium should be voluntary.

The agency is not persuaded that the mandatory declaration of magnesium is warranted, or that the declaration of potassium should be mandatory because the declaration of magnesium is not required. Magnesium is not a nutrient for which there are significant public health concerns (Ref. 23).

Further, while magnesium and potassium are found together in many foods, using magnesium as a reference nutrient for potassium in food labeling is questionable because there are many fruits and some vegetables that are excellent sources of potassium but poor to moderate sources of magnesium (Ref. 23). The agency does not believe that a mandatory declaration of magnesium content is warranted at this time.

46. One comment suggested that information on potassium should be available from manufacturers' toll-free telephone numbers. The comment explained that consumers who must monitor their potassium intake, such as renal dialysis patients, often have difficulty determining how much potassium is in a product. The comment suggested that manufacturer's toll-free numbers would provide easy access to more detailed nutrient content information.

While FDA encourages manufacturers to make additional information available to consumers, this request is beyond the authority of the agency. Toll-free telephone numbers for product information may or may not be supplied according to the preference of the manufacturer.

F. Total Carbohydrate, Dietary Fiber, Sugars, Sugar Alcohol, and Other Carbohydrate

1. Total Carbohydrate

47. Comments from trade associations, manufacturers, professional societies, and another federal agency recommended that FDA reconsider proposed § 101.9(c)(6) which excludes dietary fiber from total carbohydrate. As noted in several comments, dietary fiber traditionally has been included as part of the carbohydrate content of food, is considered part of carbohydrate in current nutrition labeling regulations, is included within total carbohydrate for nutritional labeling by Canada, and is included in the Atwater method of determining "carbohydrate by difference." Other comments pointed out that excluding dietary fiber from total carbohydrate is consistent with definitions for labeling used by Codex Alimentarius Commission and the European Community (EC), which include only metabolized carbohydrate. A comment remarked that to exclude dietary fiber from total carbohydrate is inconsistent with all major data bases and U.S. publications on food composition and is different from the way carbohydrate has been presented to the consumer in nutrition labeling for the past two decades. This comment suggested that inconsistency in definitions will contribute to consumer confusion.

In the 1990 mandatory nutrition labeling proposal, FDA proposed mandatory declaration of total digestible carbohydrate, which excluded dietary fiber, the nondigestible portion of carbohydrate. Several comments noted that while the intent of this definition for total carbohydrate was to include only energy yielding components, in fact there is evidence that fermentation of dietary fiber yields available energy. Comments noted that dietary fiber content was accounted for in deriving both the general energy factor of 4 calories per g of carbohydrate and the specific Atwater factors for calculation of energy value of carbohydrate in foods. The comments stated that total carbohydrate (excluding dietary fiber) content as defined in proposed § 101.9(c)(6) is not appropriate for calculating calories from carbohydrate as proposed in § 101.9(c)(3). As a result, two different values for "total carbohydrate" would be required to comply with nutritional labeling: (1) Total carbohydrate (excluding dietary fiber) for the content declaration, and (2) total carbohydrate (including dietary fiber) for calorie calculation.

In the mandatory nutritional labeling proposal, FDA stated that the reasen for declaration of carbohydrate content was, in part, to allow consumers to determine the percentage of calories from carbohydrate (55 FR 29487 at 29497). Several comments argued that departing from the established use of the term "carbohydrate" (i.e., including dietary fiber) used in determining carbohydrate calories by the Atwater method, will be confusing and thereby detract from the value to consumers of the caloric information. Several comments suggested that in separating dietary fiber

from "energy yielding" components of carbohydrate, FDA's logic was faulty for two reasons. First, carbohydrate fractions are not clearly delineated as digestible or nondigestible fractions. Rather, there exists a continuum of digestibility among carbohydrate substances. Second, dietary fiber is appropriately included in total carbohydrate for calculation of energy content with use of Atwater factors.

Many comments noted that, except for lignin, substances comprising dietary fiber are carbohydrates. Comments pointed out that dietary guidelines (Ref. 4) urge increased consumption of types of foods rich in both dietary fiber and complex carbohydrate and stated that separating these carbohydrate components in nutrition labeling will mislead consumers as to the nature of dietary fiber.

FDA is persuaded by the comments that the separation of dietary fiber from carbohydrate is inconsistent with established methods of reporting food composition and confuses the issue of calculating energy content. Further, the agency agrees that the separation of dietary fiber from carbohydrate will decrease consumer understanding of label information and its application to dietary recommendations that link dietary fiber and complex carbohydrate together in advising increased consumption of foods high in both. Accordingly, FDA is modifying § 101.9(c)(6) to include dietary fiber in the declaration of total carbohydrates. This action results in the inclusion of both digestible and nondigestible carbohydrates under total carbohydrates.

Section 101.9(c)(6) is also modified to state that total carbohydrate content is to be calculated by subtracting the sum of crude protein, total fat, moisture, and ash from the total weight of food. Additionally, since total carbohydrate now includes dietary fiber, the paragraphs relating to dietary fiber are redesignated under § 101.9(c)(6)(i) rather than under § 101.9(c)(7). Consequently, the remaining paragraphs within § 101.9(c) are renumbered.

2. Dietary Fiber

48. Comments from consumers, health professionals, health promotional organizations, and manufacturers agreed that declaration of dietary fiber should be mandatory. Other manufacturers, trade associations, and a university food science department disagreed and urged voluntary, rather than mandatory, declaration of dietary fiber. The arguments against required listing of dietary fiber included: (1) Analytical methods for dietary fiber in foods are not yet routine, are expensive, and lack precision in some types of foods; (2) mandatory declaration imposes an unnecessary analytical burden on producers of foods that are not significant sources of fiber; and (3) mandatory declaration will likely encourage fiber supplementation of foods.

The agency does not agree that the specified methods for fiber analysis are difficult and expensive. The operations involved and equipment required for the methods are standard in analytical laboratories. The agency recognizes that the official AOAC method for dietary fiber analysis is relatively recent. However, as a validated method, it should be included in current nutrition labeling regulations.

In regard to the analytical burden on producers of foods with insignificant amounts of fiber, the agency advises that if there is adequate and reliable reason to believe that fiber is not present, there is no need to analyze for it; it can be declared as "0". Additionally, § 101.9(c)(6)(i) provides for expression of dietary fiber in 1 g increments in recognition of the precision of analytical methods. For foods that contain less than 1 g of dietary fiber per serving, manufacturers may choose to state "contains less than 1 g" or to omit dietary fiber from the list of nutrients and to state at the bottom of the nutrition label "Not a significant source of dietary fiber."

There have always been concerns that nutrition labeling will encourage the supplementation (i.e., fortification) of foods. In part for this reason, FDA published a policy statement on the addition of nutrients to food on January 25, 1980 (45 FR 6314). The statement was issued to promote the rational addition of nutrients to foods to preserve a balance of nutrients in the diet of American consumers. In the statement, FDA established guidelines in § 104.20, which the agency urges manufacturers to follow if they elect to add nutrients to a food.

FDA intends to continue to monitor the marketplace through the Food Labeling and Packaging Survey, consumer and industry complaints, and other means to determine if inappropriate fortification is occurring. If the agency finds that there is a problem with inappropriate fortification of foods with dietary fiber or any other nutrients, it will take steps to ensure that overfortification does not result in the imbalance of essential nutrients in the diet of American consumers or the presence of excessive amounts of particular nutrients that have the potential for toxicity.

Thus the agency is not persuaded that there is a compelling cause not to require declaration of dietary fiber in nutrition labeling. Section 403(q)(1)(D) of the act requires dietary fiber to be included in nutrition labeling. Section 403(q)(2)(B) of the act allows a required nutrient to be deleted if the Secretary determines that the nutrient is not necessary to assist consumers in maintaining healthy dietary practices, but no information contained in the comments would lead to such a conclusion. In fact, most comments supported the usefulness of mandatory declaration of dietary fiber, Accordingly, § 101.9(c)(6)(i) will require the declaration of dietary fiber in nutrition labeling.

This action represents the final disposition of two petitions regarding label declaration of carbohydrates, including dietary fiber. One petition from the Kellogg Co. dated May 14, 1978 (Docket No. 78P–0091), requested, in part, permission to list under "carbohydrate" the amounts of "starches and related carbohydrates" and "sucrose and other sugars." The other petition from the Center for Science in the Public Interest dated June 1, 1987 (Docket No. 87P–0194/CP) requested that dietary fiber be a mandatory component of nutrition labeling, and that regulatory letters be sent to all manufacturers making misleading claims about fiber content.

49. Comments from nutritionists representing state cooperative extension services and from one manufacturer cautioned that declaration of soluble and insoluble subcomponents of dietary fiber should be prohibited because the methodology for separating soluble from insoluble fiber is inadequate, and because there is no scientific agreement as to the health effects of the subgroups of dietary fiber.

The agency advises that analytical methods for the measurement of soluble and insoluble dietary fiber are now part of an official AOAC method for dietary fiber (Ref. 50). While experience with these methods is limited, they will allow for accurate separation of these subcomponents.

In regard to scientific agreement as to the health effects of soluble or insoluble fiber, FDA has evaluated the health effects of the dietary fiber subgroups and has concluded that there is sufficient scientific agreement to issue a final rule permitting health claims relating to the effects of intake of soluble dietary fiber on heart disease. This decision is discussed in a companion document entitled "Food Labeling; Health Claims; Dietary Fiber and Cardiovascular Disease" published

elsewhere in this issue of the **Federal Register.**

Accordingly, § 101.9(c)(7)(i), redesignated as § 101.9(c)(6)(i)(A) and (c)(6)(i)(B), will continue to allow the voluntary declaration of soluble and insoluble dietary fiber in nutrition labeling, except that when a claim is made about either type of fiber, label declaration of that type of fiber will be required. To clarify that soluble and insoluble fiber are to be indented under dietary fiber rather than under total carbohydrate, FDA has modified § 101.9(c)(6)(i)(A) and (c)(6)(i)(B) to state "indented under dietary fiber." FDA has also modified these two sections to remove the requirement that whenever one type of fiber is declared, the other type must also be declared. Because total dietary fiber is a mandatory component of nutrition labeling, the amount of an undeclared subcomponent (i.e., soluble or unsoluble fiber) can be calculated simply by subtracting the amount of the declared subcomponent from the amount of dietary fiber. This change will minimize space requirements caused by the voluntary declaration of additional nutrients.

3. Sugars

a. *Definition of sugars.*

50. Comments from consumers, consumer interest groups, state governments, trade associations, food retailers, and a manufacturer concurred with the agency's proposed definition for sugars as the sum of all free mono- and oligo-saccharides through four saccharide units and their derivatives having similar sweetening, nutritional, and metabolic effects. Consumer interest in the sugars content of food, and concern that "sugars" should include all forms of carbohydrate sweeteners added to foods, were cited as reasons for support for the proposed definition. Comments from many consumers, state governments, and a health promotion association stated that information on content of both sugars and of sugar derivatives is important to assist consumers to moderate intake of sugars and to assist diabetics in maintaining healthy dietary practices. Consumer interest groups argued that underreporting of the sugars content in products rich in corn syrups is an appropriate justification for an expanded definition for sugars. A comment noted that the agency has a precedent for considering sugar alcohols as sugars in § 100.130(d)(4), which states that "sugar-free" type statements cannot be made on labels of diet beverages containing "sorbitol, mannitol, or other hexitols."

Other comments from a wide variety of manufacturers, trade associations, foreign and state governments, professional associations, and a Federal agency objected to the proposed sugars definition. Most of these comments recommended that the sugars definition be limited to monosaccharides and disaccharides. One argument for limiting the sugars definition to mono- and di-saccharides is that this is the traditional and widely accepted use of the term "sugars." They pointed out that it is also the definition of the term in the IOM report "Nutrition Labeling: Issues and Directions for the 1990s" (Ref. 1). Many comments noted that for conformity with international regulatory definitions for nutrition labeling (EC, Codex Alimentarius Commission, and Canada) sugars should be defined as mono- and di-saccharides.

Another argument, brought forth in comments, for limiting the sugars definition to mono- and di-saccharides is that there are no compelling health or nutritional reasons for including tri- and tetra-saccharides as "sugars." The comments pointed out that the 1986 "Report From FDA's Sugars Task Force" (Ref. 51) concluded that the only public health concern from sugars consumption in the United States is the promotion of dental caries. The IOM report (Ref. 1) concurred with this conclusion. The comments argued that, in the absence of a clear relationship between number of saccharide units and carcinogenicity, the proposal to include tri- and tetra-saccharides within sugars is not relevant to the public health concern of dental caries.

Several comments questioned the agency's logic in including tri- and tetra-saccharides with sugars. FDA had stated in the 1990 mandatory nutrition labeling proposal (55 FR 29487 at 29497) that the intent of including tri- and tetra-saccharides as sugars was to preclude potential underdeclaration of the sugars content of foods containing corn syrups. Several comments noted that mono- and di-saccharides are logically grouped in that they are sweet, naturally occurring, and rapidly absorbed, but that these characteristics are, for the most part, not in common with tri- and tetra-saccharides. Comments also noted that most corn syrup used in sweetening is in the form of high fructose corn syrup, which is composed of 95 percent monosaccharides, and that high fructose corn syrup accounts for two thirds of total U.S. corn syrup consumption. Comments noted that corn syrups with greater proportions of higher saccharides are used for technical purposes other than sweetness. Thus, the comments argued that underestimation of simple sugars from corn syrups is not of sufficient importance to warrant imposing a unique sugars definition for labeling purposes that would differ from common usage of the term.

Many comments objected to the proposed sugars definition on methodological grounds, in that they claimed that the proposed definition is not compatible with standardized analytical methods for measuring sugars. The comments acknowledged that validated methods for measuring mono- and di-saccharides in foods exist but argued that there are not collaboratively validated methods for the measurement of tri- and tetra-saccharides. The comments noted that measurement in foods of oligosaccharides larger than disaccharides is difficult, costly, and inaccurate. The comments asserted that the lack of validated analytical methodology appropriate for the definition would result in compliance difficulties and inaccurate information on the label.

FDA has evaluated all comments in favor of the proposed expanded sugars definition and those opposed to this definition. FDA is persuaded that compliance with nutrition labeling will be impeded by adopting a definition for sugars that is not supported by validated analytical methods. FDA is also persuaded that the usefulness of nutrition labeling will be hindered by adopting a definition that is inconsistent with commonly accepted use, and with the international use of the term.

FDA finds that these factors outweigh any public health benefit from including tri- and tetra-saccharides in the definition of "sugars" for nutrition labeling purposes. The public health concern associated with sugars consumption is the promotion of dental caries. While simple sugars are the most cariogenic carbohydrates, all fermentable carbohydrates, including starches, are capable of promoting dental caries. Factors such as the characteristics of the food that contains the sugar (e.g., stickiness), the frequency of consumption, and the sequence in a meal, appear to be as important in the etiology of dental caries as the sugars themselves (Refs. 2 and 3). As such, the inclusion of tri- and tetra-saccharides with sugars would not improve the ability of the label to assist consumers in maintaining healthy dietary practices with respect to dental health.

Therefore, the agency is modifying the definition of "sugars" in § 101.9(c)(6)(ii)(A), redesignated as

§ 101.9(c)(6)(ii), to include only free monosaccharides and disaccharides.

51. Several comments recommended that lactose be specifically excluded from the sugars definition for nutrition labeling. These comments asserted that the listing of lactose with sugars in nutrition labeling may mislead some consumers who may equate the lactose sugar content of dairy products with "empty calories" of products high in added sugar. The comments expressed a fear that dietary guidelines to moderate sugars consumption may lead some consumers to forego the important nutritional benefit of dairy products if lactose is included in sugars content. Comments also noted that intestinal digestion of lactose is inefficient. As such, the digestion and absorption of lactose more closely resembles complex carbohydrate than simple sugars. Furthermore, comments argued that lactose is not sweet nor used as a sweetener and could logically be separate from sugars used as sweeteners.

FDA disagrees with the comments. As discussed in the preceding comment, the agency has been persuaded of the need to define "sugars" for nutrition labeling purposes to be consistent with standard analytical methodologies and in conformity with the traditional usage of the term. Lactose, a di-saccharide, is clearly a sugar by conventional standards and is identified with all other mono- and di-saccharides in routine analytical procedures. The nutritional significance of the sugars content of certain types of foods, such as lactose in dairy products and natural sugars in fruit, and the importance of such foods as sources for other important nutrients, needs to be addressed through the consumer education program discussed below.

Accordingly, the agency is not making the recommended change to exclude lactose in the definition of sugars.

52. Several comments suggested alternative definitions for "sugars" based upon physiological characteristics rather than the number of saccharide units. Among these alternatives were suggestions for definitions based on digestibility, caloric value, glycemic index, and serum insulin response.

FDA finds that such alternative approaches are not feasible from a compliance standpoint because validated analytical methods to quantitate sugars defined in these ways do not exist. In addition, use of any of these definitions for sugars would be unique to U.S. nutrition labeling and would thus likely impede foreign trade. Moreover, because these definitions do not correspond to the commonly recognized meaning of the term, the resulting labeling information would be of limited usefulness.

53. FDA received comments that suggested alternative terminology for the "sugars" component of carbohydrate. The agency's longstanding use of "sugar" as synonymous with sucrose in ingredient labeling was cited as evidence of the need for an alternative term. Several comments felt that FDA's distinction between "sugar" and "sugars" would not be clearly understood by consumers. Alternative terms suggested included "sweeteners" and "simple carbohydrates."

FDA considered these comments but has concluded that it is best to maintain the proposed terminology. The agency advises that the term "sweeteners" would logically include the noncarbohydrate intense sweeteners, which would not be appropriately declared as a part of carbohydrate content. In addition, the term appears to apply more to added sugars than to total sugars and, therefore, would cause compliance problems because it is not possible, in most foods, to differentiate between added and naturally present sugars.

"Simple carbohydrates" may have been a good term for the originally proposed definition (i.e., mono-, di-, tri-, and tetra-saccharides). However, the agency finds it is too broad a term to encompass only the traditional sugars (i.e., mono- and di-saccharides).

b. *Total sugars versus added sugars.*

54. Some comments recommended mandating declaration of added sugars only rather than total sugars. The comments noted that consumers need to be made aware of added sugars because dietary recommendations urge use of sugars in moderation, while at the same time recommending increased consumption of fruits which are sources of naturally occurring sugars. Other comments recommended either mandatory or voluntary declaration of both added and naturally occurring sugars. One comment suggested that added sugars be required in addition to total sugars in foods containing more than 2 g of added sugar.

The agency is not persuaded that there is a need for mandatory disclosure of added sugars in place of, or in addition to, total sugars. There is no scientific evidence that the body makes any physiological distinction between added sugar molecules and those naturally occurring in a food. In addition, the agency believes that it should not promulgate regulations that it cannot enforce. When a product is sampled for compliance, laboratory analysis yields a value for total sugars. For most foods, as stated above, it is not possible to differentiate between added and naturally occurring sugars. Accordingly, the agency would not be able to determine the accuracy of a label declaration of added sugars.

Furthermore, declaration of only added sugars may significantly underrepresent the sugars content of many foods that are high in naturally occurring sugars. For example, in some fruits canned in heavy syrup, added sugars may represent only about 50 percent of total sugars. Disclosure of only the added sugars could be misleading to consumers who are concerned with total sugar intake. Therefore, the agency is retaining the provision of § 101.9(c)(ii)(A), redesignated as § 101.9(c)(ii), to declare total sugar content, e.g., that added as well as that naturally present.

While FDA is not distinguishing, on the nutrition label, between added and naturally present sugars, the agency does intend to include information about this distinction in the consumer education program that it is preparing. This information will help consumers: (1) Use the information on the nutrition label to differentiate between sugar-containing foods with high versus low levels of other important nutrients, (2) use the ingredient statement to distinguish foods with naturally occurring versus added sugars, and (3) appreciate the important role in the total daily diet of foods, such as fruits and dairy products, with naturally occurring sugars.

c. *Mandatory declaration of sugars.*

55. In the 1991 supplementary proposal, FDA requested specific comments as to the utility, appropriateness, and feasibility of requiring declaration of sugars content, particularly as such declaration relates to, and is supported by, public health goals (56 FR 60366 at 60369). Comments received were relatively evenly divided on the issue of whether the declaration of sugars should be mandatory in nutrition labeling. In general, consumers and health professionals and their associations supported mandatory declaration of sugars. Several state attorneys general and a few industry groups also agreed that consumers have a right to know the amount of sugars present. Comments argued that section 403(q)(2)(B) of the act only allows FDA to delete sugars as a mandatory component of nutrition labeling if such information "is not necessary to assist consumers in maintaining healthy dietary practices," and that such information is vital to this end. Comments from many consumers, state governments, and a health promotion

association stated that information on sugars content is important to diabetics in assisting them to maintain healthy dietary practices and to consumers in general in selecting diets that will moderate the intake of sugars. One comment urged mandatory declaration of sugars as a way to inform consumers of the content of new foods that are being marketed as "low fat" and "fat free" in which fats are being replaced by sugars.

Most industry groups as well as a few health professional associations and the IOM report (Ref. 1) recommended allowing sugars declaration to be voluntary. They argued that dietary guidance recommendations have not specified quantitative goals for sugar consumption, and that sugar declaration should not be required until a definition has been recognized by scientific communities that reflects physiological effects. They also pointed out that data bases do not generally contain information on sugars composition, so a substantial investment of time and money is needed for analysis and data base update. The comments argued that such an expenditure would be inappropriate for a nutrient of little public health concern. There was also a concern expressed that because total sugars would be declared rather than only added sugars, consumers would be confused by the amount of sugars in fruits and reduce their consumption of these foods. Despite these concerns, industry generally conceded that if sugars information is needed, requiring sugars declaration in the nutrition label is a better approach than mandating grouping of sweeteners in the ingredient statement, as the agency proposed in a document on ingredient labeling (56 FR 28593, June 21, 1991). Final action on the issue of grouping sweeteners in the ingredient statement is addressed in the final rule on declaration of ingredients published elsewhere in this issue of the Federal Register.

FDA is persuaded that mandatory declaration of sugars is of great interest to consumers, and that it will assist consumers in planning diets that conform to current dietary guidelines for Americans to avoid too much sugars (Ref. 4). As discussed above, FDA is modifying its proposed definition of "sugars" to be in conformity with general usage and international definitions for this term. The use of this definition will minimize the costs associated with necessary laboratory analyses and update of data bases.

Therefore, FDA is requiring in § 101.9(c)(6)(ii) that declaration of sugars be included in nutrition labeling.

4. Sugar Alcohol

56. Comments from a wide variety of manufacturers, trade associations, foreign and State governments, professional associations, and a Federal agency were opposed to inclusion of saccharide derivatives, specifically sugar alcohols, within the proposed "sugars" definition. The agency's proposed definition included in its coverage saccharide derivatives that have sweetening, nutritional, and metabolic effects similar to simple sugars. The comments stated that sugar alcohols are inappropriately included with sugars because sugar alcohols have many different chemical and physiological properties than sugars. Comments noted that it is these differences that motivated the development of uses for these substances and makes them useful as sugar substitutes. Comments pointed out that a salient distinction between sugar alcohols and sugars lies in their digestion and absorption, which is slower for sugar alcohols. Also, intestinal absorption of monosaccharide sugar alcohols occurs only by passive diffusion, not by active or facilitated monosaccharide absorptive mechanisms. As a result, significant portions of ingested sugar alcohols remain unabsorbed and pass into the colon, where they are fermented, similar to fiber and complex carbohydrate. Thus, the caloric value, insulin response, and glycemic index for some sugar alcohols are less than for sugars.

Several comments also claimed that sugar alcohols have reduced cariogenic potential compared to sucrose or other sugars. The comments noted that FDA proposed in § 101.13(o)(8) in the document on the general principles for nutrient content claims to permit chewing gums sweetened with sugar alcohols to be labeled as "sugar free" or "sugarless" as a means of indicating that these products do not promote tooth decay. The comments argued that declaring sugar alcohols as sugars would deny manufacturers the means to promote the reduced cariogenic potential of other sugar alcohol sweetened products relative to sugar containing products.

Comments also noted that international regulatory definitions for nutrition labeling (EC, Codex Alimentarius Commission, and Canada) exclude sugar alcohols and provide for a separate declaration of sugar alcohols under carbohydrates. As a result, the comments stated that a definition for sugars that includes sugar alcohols for U.S. nutrition labeling could be seen as an obstruction to international trade. The IOM report (Ref. 1) recommended that sugar alcohols not be grouped with sugars in ingredient labeling. Some comments argued that in the absence of any quantitative dietary guidelines concerning sugar alcohols, it is inappropriate to require any declaration of sugar alcohols in nutrition labeling.

FDA is persuaded that sugar alcohols have metabolic effects different than sugars, have a history of being considered to be sugar substitutes rather than as sugars, and have a role in contributing to dental health. FDA also acknowledges that the proposal to define sugar alcohols as sugars for nutrition labeling purposes is inconsistent with the nutrition labeling practices of other countries. Thus, FDA is modifying § 101.9(c)(6)(ii) to remove sugar alcohols from the definition of "sugars" for nutrition labeling. The agency is doing so in recognition of their usefulness as sugar substitutes in reducing the cariogenic potential of foods.

However, FDA continues to believe that the content of nutritive carbohydrate sweeteners used as sugar substitutes is of interest and importance to consumers. Therefore, FDA is retaining § 101.9(c)(6)(ii)(B), which provides for the voluntary declaration of sugar alcohols except when a claim is made on the label or in the labeling about sugar alcohol or sugars (e.g., "sugar free") and sugar alcohols are present in the food, in which case their declaration is mandatory. Because sugar alcohols will no longer be a subcomponent of sugars, FDA is redesignating § 101.9(c)(6)(ii)(B) as § 101.9(c)(6)(iii).

Removing sugar alcohol from the definition of sugars necessitates a change in the definition of sugar alcohol. The proposed definition included a criterion that sugar alcohols "meet the definition of sugars as described in paragraph (c)(6)(ii)(A)." Accordingly, FDA has revised the definition for sugar alcohol in § 101.9(c)(6)(iii) to use a chemical definition, namely that sugar alcohols be defined as "saccharide derivatives in which a ketone or aldehyde group is replaced by a hydroxyl group, and whose use in food is listed by FDA (e.g., mannitol) or is GRAS (e.g., xylitol, sorbitol)."

57. Comments from trade associations and manufacturers stated that the term "sugar alcohol" is potentially confusing in that consumers may assume such components contain a sugar and ethyl alcohol. The comments requested that the term "polyol," which has been recognized by the EC, be used in lieu of "sugar alcohol." Another comment from

the Canadian government included a copy of their nutrition labeling regulations which allow for declaration of the specific sugar alcohols by name (i.e., sorbitol, mannitol, and xylitol).

FDA advises that the term "polyol," a contraction of "polyalcohol" or of "polyhydric alcohol," is neither uniquely descriptive of the alcohol derivatives of saccharides used as sugar substitutes, nor is it a term that FDA expects consumers to recognize or understand. While the agency recognizes that it is a term that may be used voluntarily on labeling in the EC, it is unlikely that American consumers will have any concept of what it represents. As such, the agency considers the term "polyol" to be potentially more confusing to consumers than would be "sugar alcohol."

Despite this fact, FDA acknowledges that many consumers also may not be familiar with the term "sugar alcohol." Thus, FDA has decided to adopt the approach used by the Canadian Government, which allows manufacturers to use the specific name of the sugar alcohol in the nutrition label. The names of sugar alcohols that are listed or GRAS for use in food, (e.g., sorbitol § 184.1835, mannitol § 180.25, and xylitol § 172.395) are currently used in ingredient statements on labels of food packages and, hence, should be recognized by many consumers.

The primary disadvantage to this option is the introduction of the name of an ingredient into the nutrition label. While FDA is generally opposed to such a result, the agency concludes that the arguments opposed to the term "sugar alcohol" and the desire to harmonize with Canadian labeling regulations are more compelling in this instance than the need to maintain a clear separation between the nutrition label and ingredient list. However, to avoid cluttering the nutrition label and confusing consumers, if more than one sugar alcohol is used in a food, § 101.9(c)(6)(iii) provides that the term "sugar alcohol," and not the names of the ingredients, must be used in the nutrition label.

Accordingly, FDA is modifying § 101.9(c)(6)(iii) to specify the continued use of the term "sugar alcohol" or, alternatively, if only one sugar alcohol is present in the food, the name of the specific sugar alcohol present in the food may be used.

5. Other Carbohydrate

a. *Definition.*

58. In the supplementary proposal, FDA noted that the term "complex carbohydrate" has not been clearly or consistently defined, and that consensus reports that have associated increased consumption of dietary complex carbohydrate with health benefits have not attempted to define this food component. The agency solicited suggestions on appropriate chemical definitions and analytical methodology for complex carbohydrate (56 FR 60366 at 60369). Many comments from trade associations, food manufacturers, professional societies, and state and foreign governments expressed opposition to the agency's proposed definition for the term complex carbohydrate as the sum of dextrins and starches that contain ten or more saccharide units (56 FR 60366 at 60388). A majority of these comments also recommended as an alternative that "complex carbohydrate" be defined as the difference between total carbohydrate and sugars. Comments that argued for changing the definition pointed to the lack of existing analytical methodology to support the proposed definition. Thus, these comments raised concerns about the feasibility of compliance and the economic burden of developing methods and data bases. These comments also pointed out that complex carbohydrate content defined as the difference between total carbohydrate and sugars could readily be calculated.

Another criticism of the proposed complex carbohydrate definition was that the cutoff at 10 saccharide units is arbitrary. These comments noted that there are no known nutritional or physiological differences, nor a methodological justification, to make a distinction between polysaccharides smaller than 10 saccharide units and those with 10 or more saccharide units. Several comments were concerned that there is the potential for consumer confusion regarding total carbohydrate because neither of the subcomponents for total carbohydrate included the 5 to 9 saccharide unit polysaccharides.

Several comments suggested that the commonly accepted usage of "complex carbohydrate" includes all carbohydrates larger than disaccharides. Other comments suggested that complex carbohydrate should be defined as all digestible polysaccharides (e.g., dextrins, starch, and glycogen) rather than on the basis of the number of saccharide units. Comments emphasized that while there is not a consensus on a precise definition for "complex carbohydrate," the agency's proposed definition is not commonly recognized, nor is it consistent with the use of the term in the IOM report (Ref. 1).

One comment from a State government recommended that to avert undue emphasis on complex carbohydrate substances added to foods and to avoid the potential for misleading claims about complex carbohydrates, the term "other carbohydrate" should be used rather than "complex carbohydrate."

The agency noted in the supplementary proposal (56 FR 60366 at 60368) that identification of a specific benefit for complex carbohydrate is confounded by the fact that diets high in complex carbohydrate are usually mixed diets that contain significant amounts of cereal grains, fruits, and vegetables which are high in fiber, vitamins, and minerals and low in fats (Ref. 2). Thus the extent to which complex carbohydrate provides health benefits separate from those provided by fiber, vitamins, minerals, and reduced fat is unclear. FDA has evaluated comments concerning the complex carbohydrate definition and concludes that there is not sufficient consensus on the meaning of the term to justify adopting a specific definition for "complex carbohydrate."

In response to the comments that suggested defining this term as "digestible polysaccharides," FDA advises that carbohydrate digestibility is not clear cut. Some soluble dietary fiber is relatively digestible, whereas some oligosaccharides are relatively nondigestible. At this time there is not a consensus regarding the most reliable methods for determining carbohydrate digestibility nor for distinguishing energy derived from intestinal digestion from that derived from colonic fermentation. As a result, the agency feels that it is inappropriate to base a regulatory definition upon digestibility.

FDA, therefore, is modifying the definition it proposed for "complex carbohydrates"(§ 101.9(c)(6)(i), redesignated as § 101.9(c)(6)(iv)) to provide that it is the difference between total carbohydrate and the sum of dietary fiber and sugars or, if sugar alcohol is declared, the difference between total carbohydrate and the sum of dietary fiber, sugars, and sugar alcohol. This modified definition accommodates quantification of the remaining carbohydrates by calculation rather than by requiring additional laboratory analysis, and it resolves concerns that the defined components of total carbohydrate were not inclusive of all carbohydrates.

In addition, because there is no consensus on a clear definition for the term "complex carbohydrate" as it relates to physiological effects, health benefits, or dietary guidelines, the

agency concurs with the recommendation from a state government that the term "other carbohydrate" be used rather than "complex carbohydrate." The agency recognizes that the new definition will include many substances added to processed foods for technical purposes, such as for texture modification or as bulking agents. To declare these substances as complex carbohydrates would be misleading. The intent of dietary recommendations to increase the consumption of complex carbohydrates and dietary fiber is to select diets with plenty of fruits, vegetables, and grain products, not foods that have complex carbohydrates as added texturizers or bulking agents. Accordingly, FDA is modifying § 101.9(c)(6)(iv) to change the terminology from "complex carbohydrate" to "other carbohydrate." In addition, FDA is modifying § 101.9(g)(4) and (g)(6) to reflect this change in terminology.

Finally, because "other carbohydrate" will be calculated as that amount of carbohydrate remaining after subtraction of the amount of dietary fiber, sugars, and sugar alcohols (when declared) from total carbohydrate, it is logical to rearrange the subcomponents of total carbohydrate to place "other carbohydrate" at the bottom of the list. This reordering should help to reduce any potential confusion over the meaning of the term "other carbohydrate." Accordingly, dietary fiber is designated as § 101.9(c)(6)(i), sugars as § 101.9(c)(6)(ii), sugar alcohol as § 101.9(c)(6)(iii), and other carbohydrates as § 101.9(c)(6)(iv).

b. *Voluntary declaration of "other carbohydrate".*

59. In the supplementary proposal, FDA requested specific comment on the utility, appropriateness, and feasibility of mandatory declaration of complex carbohydrate content, particularly as it relates to, and is supported by, public health goals (56 FR 60366 at 60369). Based on the comments and information that it received in response to the supplementary proposal, the agency said it would decide, under section 403(q)(2) of the act, whether to include complex carbohydrate in the required list of nutrients in nutrition labeling. Several comments from consumers, health professionals, a manufacturer, and state governments supported mandatory listing of complex carbohydrates on the grounds that this information will be helpful to persons attempting to follow dietary recommendations. However, a much larger number of comments from health professional associations, academia, manufacturers, trade associations, and foreign governments supported voluntary listing of complex carbohydrates. The overriding factors cited in these comments were the lack of an accepted definition for "complex carbohydrates" and the lack of reliable analytical methods for determining amounts present. Comments also stated that dietary recommendations do not specify amounts of complex carbohydrates to be consumed; therefore quantitative information in nutrition labeling is not necessary to assist consumers in maintaining healthy dietary practices. Additionally, comments noted that the IOM report (Ref. 1) recommended voluntary listing of complex carbohydrate. Comments also pointed out that currently available data bases do not contain information on complex carbohydrates, and that there would be an inherent variability in amounts present in minimally processed foods.

In light of these comments, the agency's decision to drop the term "complex carbohydrate" because of the lack of a consensus on the meaning of the term, and the lack of methods for reliably determining the amounts present, FDA has reassessed the requirement in section 403(q)(1)(D) of the act to declare complex carbohydrates. Section 403(q)(2)(B) of the act allows the Secretary to determine whether information relating to nutrients specified in section 403(q)(1)(C), (q)(1)(D), (q)(1)(E), or (q)(2)(A) of the act is necessary to assist consumers in maintaining healthy dietary practices. If not, the Secretary may delete such nutrients from the list of those required to be included in nutrition labeling. FDA concludes that, without a specific definition for "complex carbohydrates," it is not possible to include quantitative information in the nutrition label that would assist consumers in maintaining healthy dietary practices. Therefore, under the provisions of section 403(q)(2)(B) of the act, FDA is deleting the requirement for the listing "complex carbohydrate" in the nutrition label and is allowing for declaration of "other carbohydrate" on a voluntary basis.

When "other carbohydrate" is omitted from the label, the declared subcomponents of total carbohydrate (i.e., dietary fiber and sugars) will not add up to the value for total carbohydrate in most foods. Consumer education programs should inform interested persons that other forms of carbohydrate beyond those declared on the label are in the food product. This situation is analogous to the fat category where the sum of saturated, polyunsaturated, and monounsaturated fatty acids often do not add up to 100 percent of the value for total fat because *trans* fatty acids are not included in the definition of the fatty acids but are included in the value for total fat.

G. Protein

1. Quantitative Protein Content

60. Several food manufacturers agreed with the proposed provision requiring that if the protein in foods represented or purported to be for adults and children 4 or more years of age has a protein digestibility-corrected amino acid score (PDCAAS) of less than 20 percent, and if foods represented or purported for children below 4 years have a protein quality value less than 40 percent of casein, the protein content statement must be modified by an adjacent statement, "not a significant source of protein," regardless of the actual amount of protein present. However, other food manufacturers objected to this provision of the proposal. These comments argued that the statement has little value in terms of the total dietary protein intake, and that there is no evidence of protein malnutrition in this country. These comments argued that, therefore, the statement is unnecessary. One food manufacturer stated that the statement should only be required if a claim is made. Another comment stated that the declaration of the percent of the RDI for protein should be required instead of the statement.

FDA disagrees with the comments that state the statement is unnecessary. Information on protein quantity alone can be misleading on foods that are of low protein quality. As stated in the supplementary proposal, dietary protein serves as a source of essential and nonessential amino acids, the building blocks of body protein. Because excess amino acids are not stored in the body, humans need a constant supply of good quality dietary protein to support growth and development. The determination of the quality of a protein is dependent upon the proportion and availability of essential amino acids (i.e., those amino acids that the human body cannot manufacture but must obtain through the diet) as well as the quantity of protein present. Foods that contain proteins that are low in one or more of the essential amino acids are known as incomplete proteins and are lower quality proteins than those that contain all the essential amino acids in sufficient quantities to support growth and development.

The agency believes that nutrition labeling must inform consumers when the quality of the protein is below

minimum specified levels. The majority of comments supported this position. Although the agency agrees that protein deficiency is not common in the United States, protein quality is still of concern for certain segments of the population, such as the very young and the elderly. Accordingly, the agency concludes that nutrition labeling must allow consumers to readily identify foods with particularly low quality protein to prevent them from being misled by information on only the amount of protein present.

Nonetheless, in the case of foods for adults and children over 1 year of age, the agency agrees with the comment that the percent of the reference value for protein (discussed below) is a satisfactory alternative to the statement, "not a significant source of protein," to allow consumers to readily identify foods of low protein quality. However, as discussed in the final rule entitled "Food Labeling; Reference Daily Intakes and Daily Reference Values" published elsewhere in this issue of the **Federal Register**, the label reference value for protein for adults and children 4 or more years of age has been established as a DRV rather than an RDI. As discussed in that document, this change to a DRV is necessary because the agency is no longer basing the label reference value for protein for this group on the Recommended Dietary Allowances for protein. Rather, they are now being based on percent of calories. However, because FDA did not propose DRV's for infants, children less than 4 years of age, pregnant women, and lactating women, the protein label reference values for these groups remain as RDI's.

Accordingly, the agency is amending § 101.9(c)(8), redesignated as § 101.9(c)(7), to permit the optional declaration of percent of the DRV or RDI for protein, as appropriate, expressed as "Percent Daily Value," in lieu of the statement "not a significant source of protein" when the food is represented or purported to be for use by adults and children 4 or more years of age and the protein quality value is a PDCAAS of less than 20 expressed as a percent, or when the food is represented or purported to be for use by children under 4 years of age and the protein quality value is a PDCAAS of less than 40 expressed as a percent.

FDA is not requiring declaration of percent DRV or RDI for protein instead of the subject statement, as requested in the comment, because of cost considerations. If a manufacturer is aware that the protein in a particular food product represented or purported to be for adults and children 4 or more years of age has a PDCAAS of less than 20 percent, or that the protein in a food represented or purported for children below 4 years has a protein quality value less than 40 percent of casein, and the manufacturer does not want to go to the expense of determining the precise percent of the label reference value present in the food, the agency has no objection to the use of the statement "not a significant source of protein."

In conjunction with this change, FDA is making a parallel modification in proposed § 101.9(c)(8)(i), redesignated as § 101.9(c)(7)(i), by deleting the prohibition on the declaration of percent of the RDI for protein on foods represented or purported to be for use by adults and children 4 or more years of age with a PDCAAS of less than 20 percent, or on foods represented or purported to be for use by children under 4 years of age with a protein quality value of less than 40 percent of the reference standard. That prohibition is no longer necessary because the PDCAAS method for assessing protein quality is more exact in measuring the protein quality for humans one year of age and above than the protein efficiency ratio (PER) which was previously used for all age groups. Because the PER is being retained to measure protein quality for infant foods, FDA has retained this prohibition for declarations on foods represented or purported to be for use by infants with a protein quality value of less than 40 percent of the reference standard of casein.

61. One comment requested that the food-specific conversion factors used by AOAC, and permitted in proposed § 101.9(c)(8), to convert amounts of nitrogen to protein content should be allowed in calculating the PDCAAS whenever such factors are available. The comment stated that in some cases (e.g., peanut butter) the amino acid score used in calculating the PDCAAS is artificially reduced when a conversion factor of 6.25 must to be used to calculate protein content rather than a food-specific conversion factor.

FDA agrees that there is an inconsistency in proposed § 101.9(c)(8) pertaining to the factors for converting g of nitrogen to g of protein when calculating protein content and when calculating the PDCAAS. While the method for calculating the PDCAAS described in the Report of the Joint Federation of Agriculture Organization and the World Health Organization (FAO/WHO) Consultation (Ref. 8) specifies a conversion factor of 6.25 (i.e., g of nitrogen x 6.25 = g of protein), the agency finds it appropriate to use more specific conversion factors for those foods where the official AOAC procedures require them. Therefore, to allow for consistent methods of calculating g of protein, the agency is modifying § 101.9(c)(7)(ii) to state that food-specific conversion factors required by the AOAC are to be used when calculating the PDCAAS.

2. Protein Content as a Percentage of the RDI/DRV

62. Several comments opposed the voluntary (in the absence of a claim) declaration of protein as percent of the RDI on the labels of foods intended for adults and children 4 or more years of age. The comments contended that mandatory declaration of protein as percent RDI for all groups would provide the consumer with information on how amino acid and protein needs are met and would assist consumers in appreciating that protein is an important part of the diet.

FDA disagrees with these comments. In the preamble of the mandatory nutrition labeling proposal, FDA stated that current evidence suggests that the diet typically consumed in the United States provides for an adequate protein intake of sufficiently high biological quality to meet the nutritional needs of adults and children 4 or more years of age (55 FR 29487 at 29499). Because protein intakes generally are adequate and not a public health concern for this population group, FDA finds that the additional costs associated with determination of the PDCAAS, which are necessary to calculate the percent of the DRV for protein, are not warranted on foods for this group unless protein claims are made. Therefore, while declaration of the quantitative amount of protein will continue to be required on all foods, § 101.9(c)(7)(i) allows voluntary declaration of the percent of the DRV for protein, expressed as "Percent Daily Value," for foods intended for adults and children 4 or more years of age unless a protein claim is made for the product.

63. Two baby food manufacturers suggested that the protein content expressed as percent of the RDI for protein should be voluntary for all foods, including those for infants and children less than four years of age, unless the food is infant formula or a protein claim is made. The comments stated that data show that breast or cow milk and formula are the main contributors of protein during the first 18 months, and that other foods are not sole sources of protein for infants above 4 months. One manufacturer provided survey data on the protein intake of children 2 to 18 months of age. The comments also stated that recent

evidence shows that the protein intake of children 1 to 4 years of age is 100 percent of the RDI, that nutrition information expressed as percent of the RDI would not be helpful to the parents, and that the requirement is burdensome. Other comments supported mandatory declaration of protein content expressed as percent of the RDI for children less than 4 years of age.

FDA rejects the suggestion that protein content expressed as the percent of the RDI should be voluntary for foods specifically intended for infants and children under 4 years of age. As noted in the preamble of the mandatory nutrition labeling proposal, mandatory declaration of the percent RDI is warranted for this age group because of the importance of protein quality in diets derived from a limited number of foods (55 FR 29487 at 29499). FDA acknowledges that breast or cow milk and formula are the major sources of protein during the first 18 months. However, as seen in the data provided in the comment, foods specifically intended for infants and young children, other than infant formula, do make a significant contribution to total protein intake. For example, at 6 to 7 months of age, infants are receiving approximately one-third of the total protein intake from baby foods (Ref. 52).

The agency recognizes that required declaration of the percent of the RDI for protein for foods for infants and children less than 4 years of age presents a burden to manufacturers. However, protein nutriture is critical during this period of life which is marked by rapid growth and development. Both protein quantity and quality are major factors in the utilization of protein. Because of the importance of adequate high quality protein in the diets of infants and young children, FDA considers the declaration of percent of the RDI for protein necessary. Moreover, with the information on digestibility the agency is providing in appendix B (see comment 66 in this document), declaring the percent of the RDI for protein should not be overly costly or difficult.

64. Several comments suggested the use of a system similar to the current approach of expressing the percent of the U.S. RDA for protein. Recommendations were made for the use of a single RDI or two RDI's (i.e., an RDI for proteins of high quality and another RDI for those of low quality) to calculate the percent RDI as long as the food is not intended for infants and toddlers. Three baby food manufacturers favored establishment of specific low and high protein quality-based RDI's to calculate the percent RDI for foods intended for infants.

FDA disagrees with the use of a system similar to the current approach of expressing protein as percent U.S. RDA. The use of breakpoints, as found in the existing regulation, creates artificial differences in apparent protein nutritive values of some foods when significant differences do not exist.

3. Protein Quality

65. One comment questioned FDA's authority to change the proposed protein quality methodology. The comment contended that the 1990 amendments did not require a change in methodology, and that the proposal must be reevaluated pursuant to President Bush's directive in his State of the Union address on January 28, 1992, and set forth in his memorandum on Reducing the Burden of Government Regulations (Ref. 53).

FDA stated in the supplementary proposal that while not directed to do so by the 1990 amendments, it was proposing to modify the approach for determination of protein quality in the mandatory nutrition labeling proposal. The agency did so in response to a citizen's petition submitted by Protein Technologies International Inc. (Docket No. 90P–0052), requesting that the agency accept an amino acid method that is corrected for digestibility as an alternative method for evaluating protein quality. FDA tentatively decided that the petition had merit, and that some of the concepts in the petition should be integrated into the rulemaking since protein quality is an important part of nutrition labeling. The agency has the authority under sections 201(n) of the act (21 U.S.C. 321(n), 403 (a) and (q) of the act, and 701(a) of the act (21 U.S.C. 371(a)) to modify the original proposed protein quality methodology to reflect expanding scientific knowledge. This final rule represents the final disposition of the subject petition.

66. Several comments commended the agency for acceptance of the PDCAAS method for assessing the protein quality of foods for regulatory purposes. Comments stated that the PDCAAS method was entirely appropriate and consistent with the FAO/WHO Consultation on protein quality evaluation (Ref. 8). Other comments from food manufacturers and a trade association conditionally supported the PDCAAS method. Several comments recommended that PDCAAS not be used as the sole method for measuring protein quality of foods intended for adults and children 4 or more years of age until more technical knowledge on the amino acid reference pattern and methodology is gained, and until manufacturers gain more practical experience in its application across a broad spectrum of foods. Two comments stated that compliance problems necessitate a transition period of 2 to 5 years to ease the logistical and economic burdens. Several comments supported the method but recommended that the current PER method also be permitted.

One manufacturer recommended: (1) Manufacturers be permitted to use calculated PDCAAS values for common foods and food ingredients; (2) that FDA issue a list of estimated digestibility values and PDCAAS values for major foodstuffs and ingredients before issuing the final regulation; and (3) that FDA convene an expert group to produce a data base on digestibilities and PDCAAS values and to make provision to update such a list.

Another manufacturer requested that FDA allow any valid methodology for determining protein quality for adults and children more than 1 year of age.

FDA disagrees with the recommendations that the PDCAAS method not be used as the sole method until more technical and practical knowledge is gained on its application to a broad spectrum of foods and disagrees that a transition period is needed. FDA advises that since most food products in the market place are intended for adults and children above 4 years of age, on which the declaration of percent DRV of protein is voluntary, a delay in the implementation of the PDCAAS as the sole method is not necessary.

The agency also rejects the recommendation that the PER method continue to be permitted for foods for adults and children 1 or more years of age as an option to the PDCAAS method for the following reasons: (1) The PDCAAS is based on human amino acid requirements and, therefore, is inherently more appropriate for evaluating the protein content of foods intended for human consumption than the PER which is based on the amino acid requirements of the rat (Ref. 8), (2) the PDCAAS method is recommended for regulatory purposes by a recognized international organization experienced in establishing such standards (Ref. 8), and (3) values obtained by the two methods differ so that their simultaneous use on different foods would not allow for comparison of food products.

FDA considered the recommendation that manufacturers be permitted to calculate PDCAAS values. The two pieces of information that are needed for

this calculation are the amino acid content and the digestibility of the food. FDA has concluded that current representative amino acid data bases on raw and processed food products are not sufficiently reliable to allow for calculated PDCAAS values. Current data bases often lack information on key essential amino acids, and the information that is there was often obtained using methodology that is now outdated. In addition, food processing, i.e., the chemical, biological, or physical treatment of foods, can reduce the amino acid content of the food, so that only data from a food that underwent similar processing or treatment should be utilized in calculating the PDCAAS. In time, the agency believes it will be possible to calculate PDCAAS values using representative amino acid data backed by periodic analytical spot checks, but, at the current time, more and better data are needed.

FDA does agree, however, that a data base on digestibility values could be of assistance in implementing the PDCAAS method and in reducing the expense of implementing this new methodology by eliminating the need for a bioassay. Therefore, FDA is providing a limited data base on published true digestibility values (determined using humans and rats) of commonly used foods and food ingredients, which manufacturers may use to calculate the PDCAAS for food products. The agency has decided not to publish the digestibility values in the Code of Federal Regulation at this time because the values are interim and subject to change on a frequent basis. The data base is being published in Appendix B to this document and is also available from the Division of Nutrition, Center for Food Safety and Applied Nutrition (HFF–260), Food and Drug Administration, 200 C St. SW., Washington, DC 20204.

Appendix B lists foods from nine major food groups. In the development of this data base, the agency examined scientific data that included reports by national and international organizations, review articles and other scientific articles. In examining the data, FDA first considered true digestibility values of protein foods obtained using adult subjects, followed by data using the rat as an animal model. The agency did not consider digestibility data obtained using *in vitro* methods or other animal species. Comparative reviews of digestibility of some protein using humans and the rat model suggest that the true digestibility of a variety of foods is similar in humans and rats.

There are gaps in knowledge of the digestibility of protein in common food sources. Therefore, the data in Appendix B of this document are tentative. FDA believes that with the implementation of this regulation, better data will be forthcoming, and that, in due course, it will be able to revise the data base. The agency encourages industry to submit additional data to enable FDA to expand the assortment of foods included in the data base and to update current data.

FDA concludes that it would be premature to convene an expert group to develop a data base on digestibilities and PDCAAS values. There is a need to allow time for the compilation of reliable data based on digestibility and amino acid analyses obtained by the methods specified in this regulation. FDA will reconsider the idea of convening of an expert group on protein quality as such data become available.

The agency advises that manufacturers are not precluded from using other analytical methods for their own quality control purposes as long as they assure themselves that such unofficial methods compare adequately with the official methods. For compliance purposes the methods specified in the regulation will be used by FDA.

67. Several comments recommended that the proposed new method (PDCAAS) for the evaluation of protein quality be eliminated from the regulation. Some comments stated that the PDCAAS method will not provide flexibility and will be unnecessarily burdensome and expensive, because it requires that digestibility and amino acid analysis be performed on every product for which a declaration of the percent of the RDI for protein is made. One comment stated that foods are often reformulated, creating an ongoing cost. Several comments expressed concern that, because of the costs, the PDCAAS could have unintended negative effects on the competitive position of smaller companies and on the willingness of manufacturers to provide complete nutrition information to the consumer.

A few comments argued that for some foods, the PDCAAS will result in lower values being declared for the percent of the RDI than current methodologies using the PER, and that this will effect the ability of the foods to make claims about protein content. Another manufacturer opposed the change to new methodology and commented that the PDCAAS methodology should be reviewed and scrutinized by the AOAC before application.

FDA does not agree that the PDCAAS should be eliminated. FDA wishes to clarify that declaration of the percent DRV for protein (which uses the PDCAAS method) is voluntary for foods intended for adults and children 4 or more years of age unless a protein claim is made for the product. Therefore, for this age group, the burden and expense of the PDCAAS method are voluntarily assumed by the manufacturer.

FDA acknowledged in the preceding comment that values obtained for percent of label reference value differ when calculated using the PDCAAS rather than the PER. However, the PDCAAS, based on human requirements, is inherently more appropriate for assessing protein quality of foods intended for human consumption than the PER which is based on the amino acid requirements of the rat (Ref. 8). Accordingly, label claims based on these values will more accurately describe the role of the protein product in meeting human nutrition requirements.

FDA advises that the analytical methodologies for amino acid analyses involved in the calculation of the PDCAAS method have undergone collaborative studies and have been published in the Journal of the Association of Official Analytical Chemists.

68. One comment expressed uncertainty about the proposed amino acid scoring pattern used in calculating the PDCAAS and stated that the WHO/FAO recommended further research to confirm the currently accepted values of preschool children.

FDA acknowledges that the WHO/FAO Consultation (Ref. 8) recommended further research on the proposed scoring pattern to confirm and reinforce the existing information. The Consultation concluded, however, that the proposed scoring pattern is robust and represents the best available estimate of indispensable amino acids for this age group. Because of the high protein requirements of the preschool age group for adequate growth and development, protein foods and diets with an amino acid pattern that effectively meets the needs of the preschool child will adequately meet the needs of older children and adults, whereas the reverse may not be true (Ref. 10). Therefore, FDA concludes that the proposed amino acid scoring pattern for preschool age children is at present the most suitable pattern for use in the evaluation of dietary protein quality for all age groups, except infants.

69. Comments agreed that the amino acid pattern for 1 to 4 year old children should be the same as the amino acid reference pattern for 2 to 5 year old children when calculating the PDCAAS. According to the data presented in the comments: (1) There is little difference

in the portion of protein and amino acids needed for maintenance and growth between the two age groups; (2) there is no sound nutrition rationale for using 70 percent of casein as the reference standard for 1 to 3 year old children as recommended by the Codex Committee on Nutrition and Foods for Special Dietary Uses (Ref. 10a); and (3) there is no evidence that the pattern of intake of amino acids for 1 to 3 year old children differs from, or that the pattern is inadequate compared to, the pattern for 2 to 5 year old children. The comments also confirmed that there is sufficient overlap between the age groups to render one standard adequate.

In the preamble to the supplementary proposal, FDA specifically requested comments on the inconsistency between the FAO/WHO and the Codex Committee on Nutrition and Foods for Special Dietary Uses standards for the protein quality of foods intended for children 1 to 3 years old. The data presented in the comments (Refs. 54 and 55) supported the agency's tentative conclusion to use the amino acid scoring pattern for preschool 2 to 5 year old children for determining the PDCAAS of foods intended for children over 1 year of age. Therefore, the agency is maintaining the requirement in § 101.9(c)(7) that the PDCAAS be used to measure protein quality in foods for children above 1 year of age.

. However, the agency inappropriately left a parenthetical notation in proposed § 101.9(c)(8) that indicated that casein was to be used as the reference standard for determining the PDCAAS for children greater than 1 but less than 4 years of age. Because by definition the PDCAAS uses an amino acid scoring pattern based on human requirements as the standard, the agency has modified proposed § 101.9(c)(8), redesignated as § 101.9(c)(7), to remove the reference to casein for that age group.

70. Two comments disagreed with retaining the PER method and the casein standard for assessing protein quality for infants. The comments asserted that the requirement was not consistent with the FAO/WHO Consultation recommendation for the use of the amino acid pattern of breast milk for this age group.

FDA acknowledges that the FAO/WHO Consultation (Ref. 8) recommended that the amino acid composition of human breast milk should be the basis of the scoring pattern to evaluate protein quality in foods for infants under the age of one. However, in the same document, the Consultation stated that further data on the amino acid profile of human breast milk using standardized methods of analysis are required to confirm the pattern for calculating the chemical score of infant formulas (Ref. 8).

Because of the uncertainties expressed in the FAO/WHO report (Ref. 8) and the inconsistencies in reported amino acid patterns of human breast milk (Ref. 56), the agency finds that it is premature to use the FAO/WHO reference pattern for infants, especially since this population group relies on relatively few foods for nutrients. Until further data become available, the safer course is to continue to use the current PER method using casein as a standard. When more data become available, FDA would be willing to reconsider this position in response to a petition.

71. A few comments stated that the use of the PDCAAS will understate the biological quality of vegetable proteins consumed in a mixed diet. Another comment requested that FDA provide manufacturers with ways to communicate the complementary nature of different proteins from different sources.

FDA agrees that use of the PDCAAS does not indicate the value of individual proteins consumed as part of a mixed diet. However, this is true with any method used to measure quality of proteins in individual foods. The calculation of the corrected amount of protein of a food does not take into account the complementary potential of the food in a mixed diet, i.e., how a food rich in a particular essential amino acid can "complement" a food low in that amino acid to result in a total diet that provides sufficient amounts of the amino acid. What the method does is allow for a greater awareness of the value of protein sources when consumed alone.

While FDA acknowledges that more consumer education would be helpful on the complementary effects of individual foods in mixed diets, providing such information is beyond the scope of nutrition labeling. Space limitations within the nutrition label generally prevent the addition of information to communicate the complementary nature of different proteins. However, FDA advises that the regulation does provide in § 101.9(e) for the voluntary inclusion of a second column to declare the nutrient content of common combinations of foods (e.g., milk and cereal, peanut butter and bread). It would be possible to declare in this column the percent of the DRV or RDI for protein, as appropriate, for the combination of foods. Also, the manufacturer may include nonmisleading statements about the complementary nature of protein sources in materials outside the nutrition label.

72. Several comments expressed concern over the amino acid analytical methodology and urged that high performance liquid chromatography (HPLC) technology be incorporated into the methodology, and that hydrolysis time be tailored for specific foods. One comment suggested that FDA appraise the use of plasma aminograms as indicators of protein quality.

FDA agrees that the HPLC technology should be incorporated into the suitable methodology for amino acid analyses. In the preamble of the supplementary proposal, the agency stated that the analytical methodology for PDCAAS is described in the Report of the Joint FAO/WHO Consultation, section 5.4.1 (Ref. 8). The analytical methodology includes HPLC and provides flexibility in the hydrolysis of specific foods.

The agency has evaluated the merits of using plasma aminograms for protein quality evaluation. FDA believes that the method is not appropriate for this purpose. Current methodologies using plasma amino acids for predicting the protein quality of foods are highly variable, nonstandardized, and expensive. Consequently, it is not practical on a routine basis to conduct tests using plasma amino acid changes in humans as a basis for estimating protein quality.

73. One comment requested information on how to implement the PDCAAS method and on whether commercial testing laboratories have the necessary capabilities to determine the PDCAAS value.

FDA advises that the methods for determining a food product's PDCAAS is found in "Protein Quality Evaluation, Report of a Joint FAO/WHO Expert Consultation" which is being incorporated by reference into the final rule. As stated in § 101.9(c)(7)(ii), this report is available from the Division of Nutrition, Center for Food Safety and Applied Nutrition (HFF–260), Food and Drug Administration, 200 C St. SW., Washington, DC 20204, or is available for inspection at the Office of the Federal Register, 800 North Capitol St. NW., suite 700, Washington, DC. To assist persons in using this report, FDA has modified § 101.9(c)(7)(ii) to add the specific sections of the FAO/WHO report in which the methodology is found. These sections are 5.4.1, 7.2.1, and 8.00.

For those foods for which the digestibility factors are known and found in FDA's interim data base, commercial testing laboratories will be able to calculate the PDCAAS after running an amino acid analysis as

described in the FAO/WHO report, section 8.00 (Ref. 8). The equipment necessary for amino acid analyses is commonly used by commercial laboratories and should be widely available.

For those foods for which the digestibility factor is not known, digestibility values must be determined in laboratories according to methods in the FAO/WHO Report, sections 7.2.1 and 8.00 (Ref. 8).

74. A comment noted that the agency had not specified increments for reporting the "Percent Daily Value" for protein as had been done in proposed § 101.9(c)(11)(iii) for reporting the "Percent Daily Value" for vitamins and minerals.

FDA acknowledges the oversight and is modifying § 101.9(c)(7)(i) by specifying that the "Percent Daily Value" for protein is to be declared to the nearest whole percent as it is for fat and carbohydrate in § 101.9(d)(7)(ii).

4. Conclusion

In all other respects, § 101.9(c)(8), redesignated as § 101.9(c)(7), remains unchanged except that § 101.9(c)(7)(iii) has been reserved in this document. That paragraph is included in the companion document entitled "Food Labeling; Reference Daily Intakes and Daily Reference Values" published elsewhere in this issue of the **Federal Register** in which the DRV for protein for adults and children over 4 years of age and the RDI for protein for infants, children less than 4 years of age, pregnant women, and lactating women are established.

H. Vitamins and Minerals

75. Retaining the requirement for mandatory listing of vitamin A, vitamin C, calcium, and iron on the food label was supported by a large number of comments representing a broad spectrum of consumers and consumer organizations, public health organizations, health care professionals, industry representatives, and trade associations. These comments agreed with the rationale stated in the proposal for continuing the mandatory declaration of these nutrients in nutrition labeling.

There were, however, some comments that did not support the mandatory listing of these nutrients. Some comments suggested that vitamin A and vitamin C should not be mandatory but should be allowed on the food label on a voluntary basis. One comment questioned whether inadequate intake of these vitamins is a public health issue, noting that some milk is fortified with vitamin A and stating the belief that consumers are aware that citrus fruits are sources of vitamin C. One comment noted that the IOM report (Ref. 1) recommends that vitamin A and vitamin C should be allowed on the food label rather than required. Additionally, a few comments recommended voluntary rather than mandatory declaration of calcium and iron.

In view of the strong support for the mandatory listing of vitamin A, vitamin C, calcium, and iron on the food label, and in the absence of strong opposition to the agency's proposal to require the listing of these nutrients on the label, FDA is not persuaded that voluntary listing of these nutrients is desirable and in the interest of the public health. While the IOM report does suggest that vitamin A and vitamin C could be allowed, rather than required, on the food label, it identifies vitamin A and vitamin C as potential public health issues and states that certain subpopulations are still at risk for deficiencies of these vitamins (Ref. 1). The report states that inadequate dietary intake of vitamin A is found in children under 5 years of age, and that two segments of the population are at risk for vitamin C deficiency (infants fed cow's milk exclusively and elderly individuals on inadequate diets).

FDA continues to believe that public health concerns exist for vitamin A in these at-risk groups and for the general public. While fortification of certain foods, such as low fat and skim milk, has helped to improve intakes of this vitamin among healthy persons consuming a balanced diet, the inclusion of adequate vitamin A in the diet still requires care and effort on the part of a consumer in selecting good food sources of this vitamin. Vitamin A is found in a relatively limited number of foods within the food supply, and these foods must be selectively chosen by consumers on a regular basis to ensure adequate intake.

FDA also continues to believe, as supported by numerous comments, that vitamin C is a nutrient with public health significance, in that, even with fortification efforts and greater year-round availability of citrus fruits and dark green vegetables, certain subpopulations are considered at risk (see 55 FR 29487 at 29501).

In the case of calcium and iron, these minerals are identified as public health issues in the IOM report (Ref. 1) and by numerous other sources, including the Surgeon General's report (Ref. 2), Diet and Health (Ref. 3), and the report on "Nutrition Monitoring in the United States" (Ref. 49).

Therefore, § 101.9(c)(11)(ii), redesignated as § 101.9(c)(8)(ii), requires vitamin A, vitamin C, calcium, and iron as mandatory elements of nutrition labeling.

76. Many comments were received from persons at risk of iron overload, particularly hemochromatotics, supporting mandatory labeling of iron and requesting that the food label declare both added and naturally occurring iron.

FDA has carefully considered these comments. The agency recognizes that a segment of the population is at risk of iron overload. In deciding whether the declaration of a nutrient or component on the food label should be mandatory, however, the agency must consider the broad public health significance of its action. Inadequate intakes of dietary iron are responsible for the most prevalent form of iron deficiency in the United States. Iron deficiency remains a risk for certain segments of the U.S. population, notably young children, adolescents, women of childbearing age, and pregnant women, especially those with low incomes (Refs. 2, 3, 23, and 49). Thus, public health concerns relative to iron, as stated in the National Nutrition Goals for the Year 2000 (Ref. 47), center on the prevention of iron deficiency and support increased dietary intake of iron among children 1 to 2 years of age, women 20 to 44 years of age, and low-income pregnant women. The agency believes that the listing of iron on the food label aids the consumer in making individual food selections in structuring the total diet, and that this total diet has significant effects on health.

However, as discussed in comment 54 of this document concerning added sugars, the agency has taken the position that it should not attempt to regulate actions that it cannot enforce. Because available laboratory analytical methods do not differentiate between added and naturally occurring iron, the agency would not be able to determine compliance with declared amounts of added iron.

Therefore, the agency is denying the request that manufacturers declare on their labels separate quantitative amounts of added and naturally occurring iron.

For the segment of the U.S. population at risk of iron overload, the agency notes that the food label will provide quantitative declaration of iron and vitamin C content of a food, as well as a listing of ingredients (including iron compounds if iron is added to the food). As absorption of nonheme iron may be enhanced by consumption of vitamin C containing foods, those at risk

of iron overload can decrease their simultaneous consumption of foods containing iron and vitamin C by using the information on the iron and vitamin C content of foods found on the food label.

77. The majority of comments that the agency received from consumers, health care professionals, public health agencies, universities, industry, and trade associations agreed with FDA's proposal to allow thiamin, riboflavin, and niacin to be listed voluntarily unless a claim is made, or unless these nutrients are added to a food. Most comments based their position on the decline of public health concern for deficiencies of these vitamins over the past 20 years.

On the other hand, there were some comments that advocated continued mandatory listing of these vitamins on the food label. Several comments expressed the opinion that mandatory inclusion of thiamin, riboflavin, and niacin within nutrition labeling contributed to the reduction of the incidence of deficiencies of these vitamins in the United States. One comment stated that these vitamins continue to be important to a significant portion of the U.S. population, that listing these vitamins on the label provides information on the nutritional properties of a food, and that the 1990 amendments direct FDA to mandate declaration of any vitamin that the agency deems to be important for the maintenance of healthy dietary practices.

FDA does not agree that the listing of thiamin, riboflavin, and niacin on the food label has been the major cause of the declining incidence of deficiencies of these vitamins. Rather, the agency believes that the variety and abundance of the food supply and the enrichment of many standardized foods with these vitamins are the primary factors responsible for reducing the occurrence of deficiencies of these vitamins (Ref. 57).

FDA acknowledges that these vitamins continue to be important nutrients, and that listing these vitamins on the label provides information on the nutritional properties of a food. However, the agency notes that while the 1990 amendments direct the agency to include in the nutrition label information that will assist consumers in maintaining healthy dietary practices, not all information related to maintaining healthy dietary practices can be included on the food label. If all such information were included, all essential nutrients would be declared on the nutrition label. Not only would space constraints not allow for this, but the large amount of information would interfere with consumers' abilities to use the information of the greatest public health significance (see discussion in response to comment 3 of this document). Such a result would be contrary to the intent of Congress (Ref. 16).

For this reason, FDA developed criteria in its mandatory nutrition labeling proposal to assist it in determining which nutrients to require in nutrition labeling (55 FR 29487 at 29493). These criteria specify that nutrients should be required when quantitative intake recommendations have been made in scientific consensus documents, and when the nutrient is of particular public health significance. Based on the preponderance of comments that agreed with FDA's assessment that thiamin, riboflavin, and niacin are no longer of particular public health significance, FDA has decided to provide in § 101.9(c)(11)(ii), redesignated as § 101.9(c)(8)(ii), for the voluntary declaration of thiamin, riboflavin, and niacin.

78. Several comments requested that FDA clarify whether thiamin, riboflavin, and niacin are required to be listed on the nutrition label of a product made with enriched flour, a standardized food, if no claim is made about these enrichment nutrients other than their listing in the ingredient statement as part of enriched flour. Similarly, another comment suggested that FDA explicitly state, as in current § 101.9(h)(7), that labeling of voluntary nutrients will not become mandatory if present in a food product as part of an enriched ingredient that has a standard of identity. The comment also requested that nutrients added strictly for a technological effect not be required to be declared in nutrition labeling, in a similar fashion to current § 101.9(h)(6).

Proposed § 101.9(c)(11)(ii) stated that vitamins and minerals (other than vitamin A, vitamin C, calcium, and iron which must be declared) need only be declared in the nutrition label when they are added as a nutrient supplement, or when a claim is made about them. FDA's intent in this section, which is redesignated as § 101.9(c)(8)(ii), was that when a food product is made with enriched flour as an ingredient, but the label does not make an "enriched" claim or use "enriched" in the name of the food, the nutrition label need not declare the enrichment nutrients. If, however, the product is made with unenriched flour and supplemented with nutrients as ingredients to achieve the equivalent of a product made with enriched flour, the product's label must list the enrichment nutrients in the nutrition label. Information on the amount of the enrichment nutrients is also required if an "enriched" claim is made on the label, or if "enriched" is used in the name of the food. Section 101.9(c)(8)(ii) is modified to clarify this requirement.

FDA agrees with the comment that nutrients that are not required to be declared in the nutrition label and are added to a food strictly for a technological effect need not be declared if the nutrient is declared solely in the ingredient statement and is otherwise not referred to on the label or in labeling or advertising. This provision, similar to current § 101.9(h)(6), is added to § 101.9(c)(8)(ii).

79. Several comments stated that listing of other vitamins and minerals should be required, even without a claim, such as vitamin D, magnesium, and phosphorus. One comment supported the listing of all vitamins (even those absent from the food or food product).

FDA notes from these comments consumer interest in a variety of nutrients but points out that not all nutrient information related to maintaining healthy dietary practices can be included on the food label. As discussed in comment 3 of this document, the agency must be selective with regard to the information that it requires to be listed on the label. Thus, it emphasizes nutrients or components of particular public health significance. FDA does not believe that all vitamins and minerals are of equal public health significance, a view that is supported by the IOM and Nutrition Monitoring reports (Refs. 1 and 49). The agency is also aware that space limitations on the food label require that it use discretion in deciding which nutrients it requires to be listed there.

FDA does not agree that vitamin D, magnesium, or phosphorus are of particular public health significance in the United States. Because the human requirement for vitamin D can be met with sufficient exposure to sunlight, and because milk and other foods are fortified with vitamin D, deficiencies in this vitamin are very rare (Ref. 23). Magnesium and phosphorus are cited in both the Nutrition Monitoring and IOM reports as food components that are not currently public health issues (Refs. 1 and 49). FDA, therefore, is not requiring mandatory listing of vitamin D, magnesium, or phosphorus in the nutrition label.

80. Some comments suggested not requiring any vitamins or minerals on the food label unless claims are made, or the nutrient is added to the food, in

order to minimize the space requirements of nutrition labeling.

As discussed in the supplementary proposal (56 FR 60366 at 60368), FDA interprets section 403(q)(1)(E) of the act to require the inclusion of vitamins and minerals currently required in § 101.9(c)(7)(iii) if the Secretary (or FDA, by delegation) determines that such information will assist consumers in maintaining healthy dietary practices. For the reasons discussed above, FDA, has determined that vitamin A, vitamin C, calcium, and iron meet the criterion in section 403(q)(1)(E) of the act and, therefore, must continue to be required elements of nutrition labels. The 1990 amendments did not provide for nutrients to be omitted to save space. Therefore, § 101.9(c)(8)(ii) continues to require declaration of vitamin A, vitamin C, calcium, and iron.

81. One comment requested that the final regulations allow for the voluntary identification of foods that are important sources of beta-carotene, either as a subset of vitamin A or through an independent designation. The comment stated that beta-carotene may reduce the risk of chronic diseases and appears to have its own independent biological functions in addition to serving as a source of vitamin A. The comment also noted that "Recommended Dietary Allowances" (10th ed.) states that "For food products containing large quantities of carotenoids, it would be advisable in nutrition labeling to distinguish between retinol, which in large amounts is toxic, and carotenoids, which are not" (Ref. 23).

The agency has carefully reviewed the relationship of beta-carotene to cancer in the companion document entitled "Food Labeling; Health Claims and Label Statements; Antioxidant Vitamins and Cancer," published elsewhere in this issue of the **Federal Register**. Based on that review and the stated recommendations in "Recommended Dietary Allowances," FDA has concluded that there should be a method within nutrition labeling to voluntarily distinguish the amount of beta-carotene present in food products. Accordingly, FDA is adding § 101.9(c)(8)(vi), which states that the percent of vitamin A that is present as beta-carotene may be declared to the nearest 10-percent increment immediately adjacent to or beneath the nutrient name (e.g., "Vitamin A (90 percent as beta-carotene)," see example in appendix C).

82. A few comments objected to FDA's proposed deletion of the synonyms vitamin B1 and B2 for thiamin and riboflavin, respectively. The comments argued that many consumers continue to use these terms and understand them better than the "scary-sounding chemical" names. Similar comments were received in response to proposed § 101.36 *Nutrition labeling of dietary supplements of vitamins and minerals.*

Based on the comments, the agency has reassessed its position on this issue. FDA believes that for consistency the chemical name of the nutrient (i.e., thiamin and riboflavin) must always be given when the nutrient is declared in nutrition labeling, or when claims are made (e.g., "high in thiamin"). However, the agency will not object to the voluntary parenthetical listing of "vitamin B1" or "B1" following "thiamin" and "vitamin B2" or "B2" following "riboflavin." Accordingly, FDA has modified § 101.9(c)(11)(v), redesignated as § 101.9(c)(8)(v), by adding vitamin B1 and vitamin B2 as synonyms for thiamin and riboflavin, respectively. While FDA believes a similar change is appropriate in proposed § 101.36, given the requirements of the DS Act, FDA is taking no action with respect to dietary supplements, and thus is not acting on proposed § 101.36, at this time.

83. One comment suggested that other synonyms be allowed, namely "pyridoxine" as a synonym for vitamin B6 and beta-carotene for vitamin A when the vitamin A is solely beta-carotene.

FDA rejects this comment. Pyridoxine is only one of three different forms of vitamin B6 (Ref. 23). In addition, the agency believes that it would be a more difficult term for consumers to use and understand. In regard to vitamin A, FDA believes new § 101.9(c)(8)(vi) (see comment 81 of this document) is a preferable course because in most foods, beta-carotene is only a fraction of the total vitamin A content.

84. FDA received a few comments that addressed increments for those nutrients that are expressed as a percent of a reference standard. One comment proposed a more complex incremental scheme than that in the proposed rules, suggesting 1-percent increments up to and including the 5-percent level, 2-percent increments from 6 percent up to and including the 12-percent level, 5-percent increments from 15 percent up to and including 50 percent, and 10-percent increments above the 50 percent level. Another comment suggested increments of 5 percent up to the 50-percent level and 10-percent increments thereafter. This comment suggested that FDA not permit the use of 2-percent increments because the necessary measurements are not accurate enough to allow for such small increments.

FDA proposed to maintain the current increments for vitamins and minerals, i.e., percentages are expressed in 2-percent increments up to and including the 10-percent level, 5-percent increments above 10 percent and up to and including the 50-percent level, and 10-percent increments above the 50-percent level. FDA considered both the comment suggesting a more complex incremental system and the comment suggesting omission of the 2-percent increments. Neither suggestion provided sufficient justification for the change. One appears to believe that an accuracy of 1 percent of the RDI is necessary, the other that an accuracy at 5 percent of the RDI is sufficient. Inasmuch as the agency has experienced no problems with the increments that have been in use since the early 1970's, and given that so few comments addressed this issue, the agency sees no need to modify the incremental scheme in proposed § 101.9(c)(11)(iii), redesignated as § 101.9(c)(8)(iii).

85. One comment noted that regulations specified that all nutrients except vitamins and minerals were to be expressed to the "nearest" unit or increment (e.g., total carbohydrates are to be expressed to the nearest g, and sodium to the nearest 5-mg increment between 5 and 140 mg of sodium and to the nearest 10-mg increment above 140 mg of sodium). The comment asked for direction on reporting amounts of vitamins and minerals.

To clarify the regulations and promote consistency, FDA is modifying § 101.9(c)(8)(iii) to specify that vitamins and minerals are to be expressed to the nearest 2-percent increment up to and including the 10-percent level, the nearest 5-percent increment above 10 percent and up to and including the 50-percent level, and the nearest 10-percent increment above the 50-percent level.

86. A comment objected to the provision in proposed § 101.9(c)(11)(iii) that allows vitamins and minerals that are not present to be represented by an asterisk that refers to a statement "Contains less than 2 percent of the Daily Value of this (these) nutrient (nutrients)." The comment stated that consumers might be misled into thinking that small amounts of the vitamin or mineral are present when they are not.

FDA considered this comment and has concluded that the flexibility the use of the asterisk provides in allowing manufacturers to reduce the space needed for nutrition labeling outweighs any slight misunderstanding about the amount of a vitamin or mineral present

in a food that might result. Amounts of either zero or less than 2 percent of the RDI (declared as Percent Daily Value) for these nutrients are physiologically insignificant.

The RDI's are provided in § 101.9(c)(8)(iv) which has been reserved in this document. That paragraph is included in the companion document entitled "Food Labeling; Reference Daily Intakes and Daily Reference Values" (hereinafter referred to as the RDI/DRV final rule) published elsewhere in this issue of the **Federal Register**. In accordance with section 203 of the DS Act that prohibits FDA from promulgating regulations based upon recommended daily allowances of vitamins and minerals other than the U.S. RDA's currently specified in § 101.9(c)(7)(iv) until November 8, 1993, § 101.9(c)(8)(iv) includes values for only one age group (i.e., adults and children 4 or more years of age) rather than the 5 proposed groups (i.e., adults and children 4 or more years of age, children less than 4 years of age, infants, pregnant women, and lactating women). FDA intends to adopt in accordance with section 203 of the DS Act, appropriate RDI's for all groups. Therefore, FDA has adopted the references to such groups in §§ 101.9 (a)(4), (c)(8)(i), (e), and (1) of this final rule, even though such values do not exist at this time. In the meantime, suggested RDI values for other age groups, which, to be consistent with the DS Act, are based on the 1968 RDA's are presented as guidance in the preamble of the RDI/DRV final rule.

IV. Analytical Procedures

A. General Issues

87. Several comments asserted that FDA should explicitly state the methods to be used for the analysis of various nutrients. Some comments expressed the opinion that the agency should not mandate listing of any nutrient when there are serious issues with the reliability of the analytical method. Dietary fiber was specifically cited as one example. One comment added that FDA must specify the method of analysis for analytes not available in the AOAC.

The agency acknowledges the concern expressed in the comments. In the mandatory nutrition labeling proposal (55 FR 29487 at 29498), FDA discussed the analytical methodologies for sugars and dietary fiber. The agency noted that in the 17 years since the promulgation of § 101.9, it had acquired substantial experience under the regulation, and techniques for analyzing foods for their nutrient content have greatly improved. The agency considers it is inadvisable to explicitly state a method for a particular nutrient. The applicability of a specific method to products of different matrices varies. As noted in several comments, values for some nutrients, such as fat, are dependent upon the procedure used. If a specific method is cited, it may give the erroneous impression that other methods that are more appropriate to the matrix or that utilize newer techniques could not, or would not, be acceptable. It is FDA's policy and practice that any method used to support a nutrient declaration value requires appropriate validation if it has not been collaborated for that nutrient in a specific matrix. Validation procedures are a necessary component of sound analytical technique and are frequently used even with official, collaborated methods.

The agency agrees that no nutrient should be a required component in nutrition labeling if there is no satisfactory analytical method for determining its level in a food. In fact, this view was a major factor in the agency's decision not to require declaration of complex carbohydrates. FDA believes that there is adequate methodology to assay for the nutrients that it has made mandatory elements of the nutrition label, even, as explained below, for dietary fiber.

Analysis is not needed for nutrients, however, where reliable databases or scientific knowledge establish that a nutrient is not present in the product. For example, there is no need to analyze for cholesterol in fruits and vegetables or for dietary fiber in seafood. Costs associated with nutrition labeling will be contained by not analyzing for a nutrient where there is no reasonable expectation that the nutrient occurs in the food.

88. Some comments noted that analytical variability—which ranges from 1 percent to as high as 20 percent according to one comment—may be a function of the method selected and its inherent variability, the laboratory performing the analysis, the level of nutrient in the food, and the ability to obtain a homogeneous sample composite. A few comments specifically cited the difficulty in measuring levels of complex carbohydrates or vitamin C in potatoes. These comments observed that the nutrient levels may differ between the time of harvesting and processing, as well as after a period of storage. One comment recommended that FDA allow flexibility in selecting analytical methodology such that there would be a broadened range of methods used to generate nutritional information.

FDA advises that manufacturers are free to use methods of their choice for ascertaining the quantity to declare on the label as well as for screening purposes as part of their quality control procedures. However, when questions arise as to the validity of the data, the agency will utilize the methods of the AOAC or other validated procedures.

Given the analytical problems in determining values for complex carbohydrates, the agency has deleted the requirement for declaring complex carbohydrates and is eliminating the term "complex carbohydrate" from the nutrition label. As discussed above, it is using instead the term "other carbohydrate." The term "other carbohydrate" is defined as the difference between total carbohydrates and the sum of dietary fiber, sugars, and sugar alcohols (when declared). Because a specific method of analysis is no longer required for complex carbohydrates, the concern about measuring this food component in potatoes has been addressed. In regard to the concern about the analysis for vitamin C in potatoes, FDA advises that in this situation vitamin C is a naturally occurring, or Class II, nutrient. Thus, the declaration is in compliance if the nutrient is present at a level of 80 percent or more of the declared label value. It should be noted that current regulations and § 101.9(g)(6) permit reasonable excesses within current good manufacturing practice for both vitamin C and other carbohydrate.

As more nutritional analyses are performed in support of label values, more methodologies will be validated. As a result, the number of methods that manufacturers may use in determining the amount of a nutrient will increase. Moreover, products that heretofore had not been labeled with nutrition information will now be subjected to testing. These new matrices will create new challenges for both the food industry and the agency. However, these challenges should not impede the development of full, accurate nutrition information on food labels. The agency is committed to working with industry to provide valid nutrition label information that will promote selection of healthier diets by U.S. consumers.

89. Some comments suggested that FDA work with trade associations and industry on the analytical techniques required to prepare nutrition labels. One comment recommended that designations be made as to which food matrices are appropriate for existing methods and which ones are not.

FDA agrees it should be actively involved in the review of suitable methods to be used in the

implementation of mandatory nutrition labeling. The AOAC Task Force on Nutrient Labeling Methods was established early in 1992 by AOAC for the purpose of assisting its membership in meeting the requirements of the agency's regulations. The agency worked closely with the Task Force, participating in meetings as well as in evaluating appropriate methods for various matrices. The Nutrient Labeling Task Force Report on Analytes for Nutritional Labeling is available from the agency or AOAC. The report lists the methods that are adequate for various nutrients and various matrices. As pointed out in the official AOAC publication, The Referee (Ref. 58), not all analyte/matrix combinations in the report have been fully collaboratively studied, however.

In this context, it should also be noted that § 101.9(g)(2) of these final rules allows for the use of other reliable and appropriate analytical procedures if no AOAC method is available or appropriate. Sources of such methods include FDA's "Lipid Manual" (Ref. 59) and FDA's Food Additive Analytical Manual, vol. I and vol. II (Ref. 60). Additional methods may be found in "Approved Methods of the American Association of Cereal Chemists" and "Official Methods and Recommended Practices of the American Oil Chemists Society."

The method of analysis used must be suitable to achieve the purpose for which it is used. For example, the method used to quantify vitamin C for nutrition labeling must be able to determine whether ascorbic acid or isoascorbic acid is present in the food. Isoascorbic acid and sometimes ascorbic acid are used as antioxidants in food processing. Only ascorbic acid, however, is an active form of vitamin C and considered in the determination of vitamin C content of the food. Thus, the method must be able to distinguish ascorbic acid from isoascorbic acid.

90. FDA received several comments regarding the use of the Official Methods of Analysis of the AOAC. One comment stated that the latest edition of this reference should be cited to avoid obsolescence when new editions are issued.

FDA does not have authority to not reference a particular edition of the Official Methods. The Office of the Federal Register requires that each statement of incorporation by reference into the Code of Federal Regulations contain specific information, including the date and edition of the publication. Accordingly, FDA has not modified § 101.9(g)(2).

91. A comment supported a policy whereby FDA would verify laboratory analysis results on file at a firm to substantiate the nutrition label information in lieu of doing nutrient analysis from a limited sample of products. The comment expressed the opinion that FDA should be required to perform additional sampling and testing and to consider the statistical variation inherent in test procedures before initiating a legal action, such as a seizure.

The agency disagrees with the comment. FDA is a law enforcement agency, and its mission is consumer protection. To support a misbranding charge for inaccurate nutrient content information, FDA must have accurate, reliable, and objective data to present in a court of law. To obtain that information, FDA relies upon the work performed by its trained employees because it does not have legal authority in most instances to inspect a food manufacturing firm's records.

The practice of performing nutrient analysis from a composite of 12 subsamples is well established. Compositing the contents of the twelve containers yields a numerical result essentially equivalent to what would be obtained if each container were analyzed, and the results averaged. Thus, the composite value is considered to be the same as the average of a sample of twelve containers. As noted in § 101.9(g)(4) and (g)(5), FDA will not take regulatory action based on a determination of a nutrient value that fails to meet appropriate levels by a factor inherent in the variability generally recognized for the analytical method used on that food at the level involved.

B. Calories

92. Comments stated that the regulations should clarify how calories are to be calculated. Several comments recommended adding "caloric content may be determined by the Atwater method" to proposed § 101.9(c)(3). Some comments objected to the use of the specific Atwater food factors published in "USDA Handbook 74" which have not been updated since 1955. Another comment noted that if a food item is a commodity-type product for which a specific Atwater factor is available, the caloric content for these products should be required to be calculated using the specific Atwater factors.

Several comments disagreed with the proposal to subtract dietary fiber from the amount of carbohydrate before applying the general factor of 4 (i.e., 4 calories per g of carbohydrate). These comments contended that the general factor is intended to apply to total carbohydrate including fiber. Because the gastrointestinal effects of dietary fiber were taken into account in the derivation of the general factors, these comments did not consider it to be legitimate to exclude fiber from carbohydrate content when calculating caloric content.

One comment suggested that calories be calculated from carbohydrate-plus-dietary fiber if the general factor of 4 calories per g of carbohydrate is used. Alternatively, the comment suggested that calories be calculated from available carbohydrate if the general factor of 3.75 calories per g of carbohydrate is used. The factor of 3.75 calories per g for carbohydrate is used by the United Kingdom for calculation of available carbohydrate energy (Ref. 61).

One comment suggested that both total dietary fiber and other nondigestible carbohydrate should be subtracted from the total carbohydrate content before calculating calories contributed by carbohydrates. As noted in the comments, many new food ingredients such as reduced-calorie fats, fat substitutes, and modified carbohydrates have been developed in recent years. Some of these ingredients have caloric values substantially less than the general factors of 4, 4, and 9 for protein, carbohydrate, and fat, respectively. Comments requested specific allowances for ingredients used as reduced calorie replacements for conventional ingredients to permit methods for calculating the available calories other than use of the general factors.

The agency recognizes that confusion may exist about methods for calculating caloric content because of the proposed changes in how total carbohydrate content has been defined in § 101.9(c)(6) and because of the changes in the treatment of dietary fiber. Therefore, the agency is modifying § 101.9(c)(1) to clarify how caloric content is calculated by providing five options for calculating the energy value of foods in § 101.9(c)(1)(i).

The first option, which is set forth in § 101.9(c)(1)(i)(A), is the use of specific Atwater factors that are found in Table 13 in "Energy Value of Foods—Basis and Derivation" by A. L. Merrill and B. K. Watt, USDA Handbook No. 74 (1955). FDA disagrees with the comment that suggested requiring the use of specific Atwater food factors for those foods for which such factors exist. The agency does not believe that there is any need to limit a manufacturer's flexibility in selecting a method for determining

caloric content Current regulations do not require the use of specific Atwater food factors, and no data were presented to support a change in current practices.

The second and third options utilize the general factors of 4, 4, and 9 calories per g for protein, carbohydrate, and fat, respectively. In § 101.9(c)(1)(i)(B), which provides for calculating calories by general factors, dietary fiber is included in total carbohydrate. FDA also recognizes, however, that doing so can result in significant error for the caloric value of some foods because of the relatively low energy value of dietary fiber. Adjustments for dietary fiber content are therefore appropriate for nutrition labeling of some foods.

However, because some soluble dietary fiber can make a significant contribution to a food's energy value (Ref. 61), FDA does not consider it appropriate to allow an absolute exclusion of all dietary fiber from caloric calculation. Recognizing that there can be significant levels of available energy in some soluble fiber, and that official AOAC methods for dietary fiber now provide for separation of soluble and insoluble fiber, the agency considers it appropriate to permit exclusion of the insoluble component of dietary fiber alone from calculation of carbohydrate calories. Accordingly, FDA has added § 101.9(c)(1)(i)(C) in the final rule to permit calculation of caloric contribution from the carbohydrate portion of food by multiplying carbohydrate content minus insoluble dietary fiber content by the general factor of 4 calories per g.

In addition, § 101.9(c)(1)(i)(D) permits manufacturers or users of soluble dietary fiber additives or other food additive substances with reduced available energy to petition for use of alternative energy factors in nutrition labeling through established procedures for food additive or GRAS petitions. Soluble dietary fiber substances are frequently added to foods to replace fully caloric nutrients in formulating reduced calorie foods. In such cases, the burden for establishing the actual energy value of the food is appropriately with the manufacturer.

The calculation of the caloric contribution of novel fats and carbohydrates has been discussed in section III. of this document. The agency has stated that it will consider digestibility of new products on a case-by-case basis as requested. In support of this action, the agency requests that manufacturers who wish to declare adjusted values for the energy contribution of a substance, based on reduced digestibility, submit information on digestibility of the substance, analytical assay procedures for the substance, and data on interference with required methods of analysis. As stated in section III. of this document, this information should be included in a food additive petition or a petition for affirmation that the use of a substance is GRAS. The agency will then publish the specific digestibility coefficients in 21 CFR part 172 for food additives and in 21 CFR part 184 for GRAS substances. These coefficients can be utilized in determining the caloric value of specific food ingredients.

Other procedures may be required for particular foods and will be addressed by other appropriate means. FDA is allowing for this contingency in § 101.9(c)(1)(i)(D) by adding "or other means, as appropriate." For example, in the voluntary nutrition labeling program for raw fish, data were presented to FDA supporting a value of fat and calories for the fish "orange roughy" that omits a portion of the total fat since more than 90 percent of the fat in the product is in a wax ester that is not metabolized (Ref. 62). FDA published these corrected values for available fat and calories in Appendix B "Nutrition Labeling Provided by FDA for the 20 Most Frequently Consumed Fish" (57 FR 8175; March 6, 1992).

To afford even more flexibility in determining caloric content, FDA is including § 101.9(c)(1)(i)(E), to provide for the use of bomb calorimetry. The agency notes that the caloric value so obtained must be corrected for nonmetabolizable protein by subtracting 1.25 calories per g of protein to correct for incomplete digestibility, as discussed in Energy Value of Foods, Basis and Derivation, "USDA Handbook No. 74" (Ref. 63). The caloric value determined by bomb calorimetry may give a higher value than the other allowed methods. However, because it would produce an over-estimation of the caloric content of the food, FDA would not consider it to be disadvantageous to the consumer. A primary consideration in selecting which method to use must be the accuracy of the declaration of the caloric content in light of the agency's compliance criteria in § 101.9(g).

The agency is aware that some manufacturers have developed their own specific factors for conventional food ingredients that they use in calculating the caloric content of their products. FDA views this practice as analogous to using data bases to determine nutrient label values, in that the manufacturer assumes the responsibility for ensuring that the values obtained are consistent with those obtained analytically by FDA. As such, the agency does not believe it needs to provide for this option in § 101.9(c)(1)(i).

In summary, the agency is amending § 101.9(c)(1) to permit five optional methods for calculation of caloric content of foods: (1) Specific Atwater food factors (i.e., the Atwater method) given in Table 13, "Energy Value of Foods—Basis and Derivation," A.L. Merrill and B.K. Watt, USDA Handbook No. 74 (1955), (2) general factors of 4, 4, and 9 calories per g of protein, total carbohydrate including dietary fiber, and total fat, respectively, as described in USDA Handbook No. 74, (3) general factors of 4, 4, and 9 calories per g for protein, total carbohydrate, and total fat, respectively, as discussed in USDA Handbook No. 74, except that insoluble dietary fiber content may be subtracted from total carbohydrate content before calculating the caloric contribution of the carbohydrate portion of the food; (4) specific factors for particular food ingredients approved by FDA through incorporation in 21 CFR parts 172 or 184 or other means, as appropriate, or (5) bomb calorimetry data after subtraction of 1.25 calories per g protein to correct for incomplete digestibility, as described in USDA Handbook No. 74, p. 10.

By providing for these varied means of calculating caloric content, FDA is giving manufacturers flexibility in how they determine calorie content in a variety of foods, both conventional foods and new foods developed to meet changing marketing strategies.

93. A recommendation was made in one comment that products with a negligible amount of dietary fiber (suggested as less than 2.5 percent) should not be required to have dietary fiber analysis for determination of caloric content.

The agency advises that because revised § 101.9(c)(6) now includes dietary fiber in total carbohydrate content, separate analysis for dietary fiber is no longer required for calculation of either carbohydrate content or calories from carbohydrate. Therefore, the concern expressed in this comment has been addressed.

94. Several comments asked for clarification on the discussion in the mandatory nutrition labeling proposal (55 FR 29487 at 29493 and 29503) of the possible caloric contribution of macronutrient substitutes or other ingredients such as certain types of soluble fibers or gums. While one comment agreed with the agency's position that manufacturers of these ingredients should be asked to provide

evidence that these substances do not contribute to the energy value of food, another comment found the concern unwarranted and opposed the use of any correction factors for calories from soluble fibers (e.g., gums). One comment noted that more research is needed in this area.

In the mandatory nutrition labeling proposal, the agency expressed concern that available energy of soluble dietary fiber food additives (e.g., gums) would not be included under the agency's proposed method for caloric calculation, which excluded energy contribution of all dietary fiber. Innovations in food technology have resulted in reduced calorie foods that utilize various soluble dietary fibers and other modified carbohydrates, proteins, and fats for technical effects that allow reduction of total fat content. The agency considered it inappropriate to automatically assign a zero energy value to all soluble dietary fiber additives when some of these substances may have available energy. Likewise, some modified carbohydrate additives may have less available energy than the 4 calorie per g assigned by the general energy factor for carbohydrate but still have available energy. The agency has determined that petitions regarding specific caloric values for these types of food ingredients are appropriate. FDA's new policy is discussed in comment 92 of this document.

C. Fats, Fatty Acids, and Cholesterol

95. As discussed in section III. C. of this document, comments raised many questions about analytical procedures to be used to measure fat and their reliability. In addition, several comments expressed concern regarding the adequacy of methods for measuring cholesterol. One comment cited a published article on a method for measuring cholesterol that is undergoing collaborative study under the auspices of the AOAC.

The agency believes that its new definition for total fat in § 101.9(c)(2) (i.e., total lipid fatty acids expressed as triglycerides) will help to clarify what analytical procedures are to be used by clarifying what compounds are to be included in the declaration of total fat. As with all nutrient analyses, consideration must be given to the analyte and matrix when selecting a method to determine total fat content. To that end, the AOAC has established methods for analyzing for total lipid fatty acids in a variety of product matrices. A recent publication of the AOAC, The Referee (Ref. 32), contains a compilation of these methods. Other reliable and appropriate methods are also cited in comment 89 of this document.

FDA notes that issues exist about the reliability of methods for measuring low levels of fat. As discussed in a recent article, fat determinations are reliable down to concentrations of 1 to 5 g per 100 g, provided a large enough test portion is taken to obtain at least 50 mg of weighable residue (Ref. 64). The premise is that accuracy generally increases when larger amounts are used for analysis so that there is always a minimum quantity of extracted fat available for weighing.

Although official analytical methodologies for determining cholesterol content are somewhat limited at the present time, the agency is pleased to note that comments indicate that this is an area of active research. FDA, as a member of the AOAC Task Force on Nutrient Labeling Methods, looks forward to the development of additional collaborated methods for a range of matrices.

D. Dietary Fiber

In proposed § 101.9(c)(3) of the mandatory nutrition labeling proposal and proposed § 101.9(c)(7)(ii) of the supplementary nutrition labeling proposal, FDA specified that total, soluble, and insoluble dietary fiber content are to be determined by the method "Total Dietary Fiber in Foods, Enzymatic Gravimetric Method."

96. One comment noted that satisfactory analytical procedures for measuring dietary fiber are available and cited the American Association of Cereal Chemists Method No. 32–21 and the proposed AOAC method. This comment stated these methodologies were at least as accurate as certain other sanctioned procedures. It acknowledged that research should continue, however, to improve the utility and standardization of analytical methods for fiber. Another comment noted that the precision of the proposed method may cause difficulties at low levels, typical of that found in some fruits and vegetables (more than 1 percent to 5 percent) and especially when fat is present in the sample. The comment stated that because of questions concerning the accuracy of methods for measuring dietary fiber, companies may elect not to declare low levels of fiber in their products. The comment stated that there is a more accurate method for use in these situations.

Two comments from the meat industry expressed concern that the proposed method for fiber had only been evaluated on cereals, grains, and breads. They questioned the applicability of the method to other types of products. According to another industry comment, currently approved methods for analyzing dietary fiber seriously underestimate dietary fiber content of high moisture foods, which leads to inaccurate and misleading label information. This comment said that a current analytical method for high moisture products is unavailable. A comment expressed the hope that the tests adopted to measure dietary fiber would not falsely exclude low molecular weight bulking agents, such as polydextrose.

The few comments that addressed analytical methods for soluble and insoluble fibers were split on whether available methods are adequate or inadequate. One comment to the supplementary proposal noted that the agency's cited method does not measure soluble fiber directly. The comment said that the method measures total dietary fiber and insoluble dietary fiber, then calculates soluble dietary fiber as the difference between the two.

With the currently available AOAC methods for dietary fiber and its components, FDA believes that suitable methodology exists for the analysis of dietary fiber for nutrition labeling purposes. Since the issuance of the supplementary proposal, two additional methods for dietary fiber have been accepted by the AOAC, based upon the collaborative data. One new method (AOAC 15, 991.43) permits the discrete analysis of total dietary fiber and of each subcomponent, i.e., soluble and insoluble dietary fiber. The concern expressed by the comments as to the availability of validated methods for measuring dietary fiber is therefore alleviated. Because methods for measuring dietary fiber are now included in the Official Methods of Analysis of the AOAC, § 101.9(c)(7)(ii) of the supplementary proposal, which described dietary fiber methodology, and § 101.9(g)(2), which directs compliance by official AOAC methods, are redundant. As such, § 101.9(c)(7)(ii) has not been included in the final rule.

The enzymatic-gravimetric method (AOAC 15, 985.29) cited in proposed § 101.9(c)(7)(ii), is valid for high-moisture foods and those with fat present in the product. The method specifies drying conditions, as well as defatting procedures, that are to be performed before analysis for total dietary fiber. If drying conditions are a part of the analysis, analytical results must incorporate the loss on drying to obtain the total dietary fiber content of the "as received" product. Likewise, any loss of weight from fat or sugar removal must also be compensated for in the calculations.

Regarding the comment on the appropriateness of including low molecular weight bulking agents in dietary fiber, in the absence of a consensus on a chemical definition for dietary fiber, the available analytical methods dictate classification of such ingredients. Some manufactured low molecular weight, carbohydrate based, bulking agents, such as polydextrose, do not analyze as dietary fiber in the official AOAC methods for measuring dietary fiber. Such food ingredients, while not reported as dietary fiber in nutrition labeling, would be included in total carbohydrate and reported as "other carbohydrate."

97. A few comments recommended that dietary fiber be listed in 0.5-g increments, believing it to be a meaningful quantity to declare. Other comments concurred with the agency's proposal of whole-g declaration for dietary fiber on the basis that 0.5 g requires greater analytical precision than is possible for measuring dietary fiber.

The agency disagrees with the first comment. No data were presented to support a change to 0.5-g increments. Therefore, FDA continues to believe that the precision of the analytical methodology for determining quantitative amounts of dietary fiber does not allow for accuracy to the 0.5 g level. Accordingly, § 101.9(c)(6)(i) will require that dietary fiber be expressed to the nearest g.

98. One comment recommended use of the word "fiber" in lieu of "dietary fiber." The comment stated that consistency with the 1990 amendments was not needed and was far less important than using terms that consumers understood. The comment also contended that insertion of the word "dietary" into each term of fiber content would clutter the label.

The agency disagrees with the comment. No data were presented to support the contention that the term "dietary fiber" would confuse consumers. FDA believes that it is important to distinguish between dietary fiber and crude fiber to ensure that there is no question as to what fiber components are declared.

99. One comment took exception to the agency's citation of USDA Handbook 74 (1955) as the reference for the subtraction of dietary fiber in the calculation of total carbohydrate at § 101.9(c)(6) of the supplementary nutrition labeling proposal. In the cited reference, dietary fiber is not a part of the calculation. The comment noted that, as a defined, analyzable entity, dietary fiber was unknown in 1955.

FDA acknowledges the accuracy of the comment in regard to the concept of what dietary fiber was in 1955. As noted previously, the agency has modified § 101.9(c)(6) so that dietary fiber is no longer subtracted from the weight of the total food in the calculation of total carbohydrate content for nutrition labeling purposes. Therefore, the concern expressed by this comment has been addressed.

E. Sugars and Other Carbohydrate

In the mandatory nutrition labeling proposal, FDA discussed the analytical methodologies for sugars and dietary fiber (55 FR 29487 at 29498). The agency acknowledged in the supplementary proposal (56 FR 60366 at 60369) that analytical problems were a concern for the mandatory declaration of sugars and complex carbohydrate.

100. Essentially all of the comments stated that current methodology is inadequate to determine the levels of sugars and complex carbohydrate, as defined. Other comments described the methodology as unavailable, costly, difficult, and imprecise. One comment noted that there are no current analytical standards for measuring complex carbohydrates as defined in FDA's proposed rule. There were no comments that provided references for available, validated analytical methodology for these food components. Another comment noted that assay techniques for the quantitative determination of polysaccharides of 10 and higher saccharide units are beyond the reasonable capabilities of many in the food industry.

One comment included an evaluation of two liquid chromatographic procedures for monosaccharides through pentasaccharides and delineated disadvantages of each. The technique of high performance ion chromatography was identified by the comment as the technique that could provide the most accurate values for sugars. This technique has not however, been studied collaboratively by the AOAC.

Concerns expressed in regard to the analytical determination of sugars and complex carbohydrates have been alleviated by the revision of the definition of "sugars" to include only the sum of mono- and disaccharides and of "other carbohydrate" as the difference between total carbohydrates and the sum of dietary fiber, sugars, and sugar alcohols (when declared). There is established methodology in the Official Methods of Analysis of the AOAC for the determination of mono- and disaccharides in several food groups with a high degree of confidence. Continued analytical work will be necessary to validate methodology for a wider, more diverse food supply.

The agency will use the technique of HPLC in monitoring compliance with label statements concerning sugars content. The agency's use of this technique will not preclude the use of emerging technologies such as high performance ion chromatography or supercritical fluid chromatography as they are developed and validated.

F. Vitamins

101. A comment stated that the agency should list those carotene fractions that can be included in the declaration of vitamin A for labeling purposes. It noted that a variety of HPLC methods for vitamin A and carotene are available and currently in use by industry and FDA. The comment also stated that analytical reagents required for AOAC official methods for determining vitamin A content are no longer available.

In its RDI/DRV proposal, the agency proposed that vitamin A content is to be expressed in retinol equivalents (55 FR 29476 at 29485). One retinol equivalent was established to be equivalent to 1 microgram (μg) retinol or 6 μg beta-carotene. The nomenclature for vitamin A as retinol equivalents was carried forward in the supplementary proposal at § 101.9(c)(11)(iv). FDA is aware of literature data where alpha-carotene is present in some carrots in significant amounts. To account for this and other carotene fractions, the agency also recognizes the National Academy of Sciences' definition of retinol equivalents as 12 μg of provitamin A carotenoids other than beta-carotene (Ref. 23).

As noted above, the agency worked closely and actively with the AOAC Task Force on Nutrient Labeling Methods to judge the adequacy of AOAC methods to meet nutrition labeling needs. The decreased availability of the analytical reagents for some methods for determining vitamin A content has caused both industry and the agency to rely more on HPLC procedures. For example, the yellow OB dye (formerly FD&C Yellow No. 4) used for standardizing the alumina column in the AOAC method for determining the vitamin A content in margarine is no longer readily available. However, FDA advises that the Nutrient Surveillance Branch (HFF–266), Center for Food Safety and Applied Nutrition, FDA, can provide limited quantities of the dye upon request to the address listed at the beginning of this document.

V. Format

A. Legal Authority for an Improved Nutrition Label Format

Congress clearly intended that nutrition information be presented to the public in a manner that facilitates understanding of the information and that assists consumers in maintaining healthy dietary practices. This fact is evidenced by at least two provisions of the 1990 amendments. Section 403(q)(1) of the act, which was added by the 1990 amendments, states:

> The Secretary may by regulation require any information required to be placed on the label or labeling by this subparagraph or subparagraph (2)(A) (section 403(q)(1) or (2)(A)) to be highlighted on the label or labeling by larger type, bold type, or contrasting color if the Secretary determines that such highlighting will assist consumers in maintaining healthy dietary practices.

In addition, section 2(b)(1)(A) of the 1990 amendments states that the implementing regulations shall:

> • • • require the required information to be conveyed to the public in a manner which enables the public to readily observe and comprehend such information and to understand its relative significance in the context of a total daily diet.

Consistent with the authority vested in the Secretary (and FDA, by delegation) to determine if specific label information will assist consumers in maintaining healthy dietary practices, the House report accompanying the 1990 amendments directs FDA to consider a variety of format options, including: "information about the recommended daily intake, the use of descriptive terms such as 'high,' 'medium,' and 'low' or use of universal symbols to indicate desirable or undesirable levels of particular nutrients." The report goes on to state: "While the bill does not mandate any particular approach, it does require the Secretary to specify requirements that would permit the consumer to understand the nutrition information pertaining to a particular food in relation to recommended dietary information" (Ref. 16).

B. The Role of the Nutrition Label

The 1990 amendments provide several descriptions of the role of the nutrition label. Section 403(q)(1) of the act, which was added by the 1990 amendments, uses the language "assist consumers in maintaining healthy dietary practices." Section 2(b)(1)(A) of the 1990 amendments uses the language "enables the public to readily observe and comprehend such information and to understand its relative significance in the context of a total daily diet." In the format proposal, FDA requested comment about how the nutrition label can best assume the information role mandated by the 1990 amendments.

102. A number of comments from food manufacturers, trade associations, health promotion organizations, and consumer groups identified more than one role for the nutrition label in assisting consumers in maintaining healthy dietary practices. One illustrative comment from a health professional organization described two different roles of the food label as: (1) Helping consumers choose appropriate foods and (2) helping consumers to understand the "importance of diet and proper dietary behaviors to a healthy life." Similarly, a comment from a trade association made the distinction between the food label "contributing to the consumer's understanding of the relative significance of the food in the context of a total daily diet" and providing "guidance on how to use information in the food label to make appropriate food choices." Many comments made similar distinctions between the food label helping to place the particular product in the context of a daily diet and the food label providing guidance on how to maintain healthy dietary practices. A number of comments from industry questioned whether the act mandated an explicit educational role for the nutrition label to provide guidance to consumers on how to maintain healthy dietary practices.

Many comments argued that the nutrition label cannot by itself provide all the information important to maintaining healthy dietary practices but reached different conclusions about the relevance of this limitation for the nutrition label format. A number of comments, particularly from industry, pointed out that because of the limited space available on the food label, the nutrition label cannot be expected to adequately convey all the information consumers need to understand the importance of nutrition information in maintaining healthy dietary practices. These comments concluded that the role of the nutrition label should be limited to providing factual, product-specific information, and that the broader dietary guidance role should be reserved to off-label activities of public and private nutrition education programs. These comments asserted that these programs will have sufficient time and space to inform consumers about the concepts of flexibility and personal choice necessary to maintain healthy dietary practices.

Other comments, primarily from consumer organizations and health professional groups, acknowledged the necessity of off-label consumer education to help consumers understand how to use the nutrition information to maintain healthy dietary practices but saw the nutrition label as a useful food selection tool that needs to be integrated with off-label educational programs.

FDA agrees that the nutrition label can and should help consumers make informed food choices, and that it can also contribute to helping consumers maintain healthy dietary practices. The two roles are by no means inconsistent. To help consumers make appropriate food choices contributes undoubtedly to maintaining healthy dietary practices. Among those choices are choices that will assist the consumer in maintaining healthy dietary practices. Maintaining healthy dietary practices, however, is a larger and more complex goal than informing food choices, and one that requires motivation and knowledge of how to combine and balance the many different kinds of foods and eating occasions that constitute a total diet. The 1990 amendments require the agency to take both senses of the possible role of the nutrition label into account in evaluating alternative formats for the nutrition label. However, the agency also agrees that the mandated role of the nutrition label to assist consumers in maintaining healthy dietary practices does not encompass an explicit educational role for the nutrition label to provide dietary guidance to consumers.

The agency believes that the nutrition label format needs to give first consideration to helping consumers make informed food choices by enabling them to both comprehend the nutritional value of the food and to understand its relative significance in the context of the total daily diet as called for in section 2(b)(1)(A) of the 1990 amendments.

The agency's view is that the basic format elements that best serve the mandated role of the nutrition label must be identified and justified on the basis of consumer research. Therefore, the implications of format elements for the use of the nutrition label in assisting consumers to understand the nutritional value of the food and to understand the food in the context of the total daily diet were extensively examined in the agency's format research.

C. Need for Consumer Research

Section 2(b)(1)(A) of the 1990 amendments specifies criteria for an acceptable format for nutrition label information. The operative terms in this section, "readily observe and

comprehend" and "understand its relative significance in the context of a total daily diet," are goals stated in terms of consumer perception and understanding. The consequences of various formats and format elements on consumer perception and understanding can only be measured objectively in terms of behavior (i.e., in terms of how well consumers use a format for a specific task). Formats and format elements can be assessed subjectively by asking consumers or experts to judge the usefulness of various formats. Behavior-based performance measures, however, rather than subjective judgment, are generally accepted as the more reliable and valid way to evaluate the consequences of information displays on consumer perception and understanding.

Major scientific groups (Refs. 1, 65, and 66) urged FDA to subject possible nutrition label formats to consumer testing to objectively determine which formats can be used most effectively by consumers. FDA has placed considerable emphasis on the importance of consumer research in developing a new format for the nutrition label because of this advice and because the techniques of consumer research (surveys, focus groups, experiments, and preference polls) provide the best and perhaps the only possible bases for evaluating alternative nutrition label formats against the consumer perception and understanding criteria specified in the 1990 amendments.

103. A number of comments argued that virtually any nutrition label format, even the current format, can serve to help consumers put foods in the context of a total daily diet depending on the knowledge and understanding of the person reading the label. To the same point, many comments recommended nutrition education activities to supplement the public's understanding of label information. Some comments suggested that nutrition education activities can be an alternative to including one or more information elements, such as a listing of DRV's for certain macronutrients, on the nutrition label.

FDA agrees that each person's knowledge is the necessary context for understanding label information, and that nutrition education activities can be an important complement to the public's understanding of label information. FDA disagrees with the implication sometimes drawn from these facts that FDA is thereby relieved from the burden of adopting a format based in part on the available evidence about what kind of format does the best job at achieving the objectives of the 1990 amendments. Although various considerations bear on the selection of a final nutrition label format, FDA believes that an essential criterion is how well a format conveys information that Congress expected would be provided by the nutrition label. Congress expected that such information would allow people to decide whether, based on the nutrition content of the food, they would want to buy the food (Refs. 67 and 68) and to understand the relative significance of the food in the context of the daily diet (section 2(b)(1)(A) of the 1990 amendments). FDA has sought to measure, and has sought other information that measures, the ability of various formats to achieve these objectives.

D. Consumer Research Submitted as Comments or Referenced in Comments to the Format Proposal

1. Background

The agency reviewed a number of qualitative studies (i.e., five focus groups, seven preference polls) and quantitative studies (i.e., five surveys, seven experiments,) that were submitted as comments or referenced in comments to the format proposal. Consumer research studies about format issues were conducted by FDA, food industry groups, individual food companies, consumer groups, public health organizations, health professionals, and academic researchers.

Much of this work was done in response to FDA requests for additional information, and became available only in comments submitted in response to such requests. For example, FDA published an advance notice of proposed rulemaking in the **Federal Register** of August 8, 1989 (54 FR 32610), soliciting public comment on a wide range of food labeling issues, including: (1) Whether to revise requirements for nutrition labeling and (2) whether to change the nutrition label format. FDA subsequently held four public hearings on food labeling, the last of which was held in Atlanta, Georgia on December 13, 1989. This last public hearing focused on the nutrition label format.

Additionally, in the **Federal Register** of May 20, 1991 (56 FR 23072), FDA published a notice announcing the availability of a report on research on alternative nutrition label formats that had been conducted by the agency and inviting comments on the report. The comments on this notice were used in the design and execution of subsequent consumer research conducted by the agency. In the **Federal Register** of July 1, 1991 (56 FR 29963), FDA announced a plan for a cooperative pilot program with industry to test alternative nutrition label formats that led to several industry sponsored nutrition label format studies. In the **Federal Register** of April 2, 1992 (57 FR 11277), FDA gave notice of a meeting for industry, including small businesses, at which the agency presented the results of its research studies related to the format and design of the nutrition label, so that comments to the proposed format rule (57 FR 32058) could be as informed as possible.

In a number of instances, FDA staff provided materials, information, support, and consultation on technical aspects of study design and label format to researchers. In addition, FDA received many comments from the general public in response to articles in newspapers and newsletters that solicited consumer opinions in the form of informal polls based on examples of possible nutrition label formats provided by FDA. Table 1 presents a summary of the various research studies received in response to the format proposal and the format research conducted by FDA.

Table 1.—Research Studies Submitted as Comments or Referenced in Comments to Docket Number 91N-0162: Food Labeling: Format of Nutrition Label; Proposal

A. Experimental Studies Submitted

1. Frito-Lay Study (Ref. 74)

a. Design: Between subjects; five format cells.

b. Subjects: Central location test; adults, age 18+ who purchased and/or ate salty snacks in the past 4 weeks, one site, N=750.

c. Formats tested: Same as FDA Study 1 on actual product.

d. Key dependent measures: (1) Scale based on seven questions, three number-of-serving type and four dietary-judgment type; (2) rating of single format based on helpfulness, ease of use and adequacy of information.

e. Assessment/comments: All subjects saw same product. Well controlled study.

2. GMA/NFPA Industry Study (Ref. 71)

a. Design: Between subjects; seven format cells.

b. Subjects: Shopping mall intercept/central location test; adults 18+ who did at least half of household food shopping, quota controls on age, income, education and race; 36 sites, N=5,600.

c. Formats tested: Same as FDA Study 2 on realistic product mockups.

d. Key dependent measures: (1) Product comparison task identical to FDA task; (2) four-product comparison task with specific nutrient probes, (3) dietary judgment task with specific nutrient probes, "if you were trying to get more/limit (NUTRIENT) in your diet, how would you feel about eating this

(FOOD)?"; (4) rating of single format based on adequacy of information and ease of use, (5) self-report of whether subjects knew how to use the DRV information.

e. Assessment/comments: Each subject worked with only one format executed in a variety of ways. Products are confounded with tasks. Format executions are inconsistent across products. Percent DRV formats are sometimes executed with 1, 3, or 4 column displays depending on product, while other formats have either one- or two-column displays. This complex execution for Percent DRV formats may explain why they show poor product comparison performance and are rated more negatively than other formats. Exposure to formats on early tasks may affect responses on later tasks.

3. FDA Format Study 1 (Ref. 69)

a. Design: Repeated measures within subjects; subjects assigned to one row of a 5(formats) X 5(products) Greco-Latin Square.

b. Subjects: Shopping mall intercept/central location test, adults 18+ who did at least half of household food shopping, quota controls on age, income, education and race; eight sites in seven states, N=1,560.

c. Formats tested: Five formats (see format proposal (57 FR 32058)).

d. Key dependent measures: (1) Product comparison task, measured both accuracy and time; (2) preference rating for most liked/least liked format among the five seen in the study, and reasons for choices.

e. Assessment/comments: Formats presented as two dimensional nutrition labels of realistic size but not on packages.

4. FDA Format Study 2 (Ref. 70)

a. Design: Repeated measures within subjects; subjects assigned to one row of one of three 4(formats) X 4(products) Greco-Latin Squares.

b. Subjects: Shopping mall intercept/central location test, adults 18 + who did at least half of household food shopping, no quota controls; 8 sites, N=1,232.

c. Formats tested: seven formats (see format proposal (57 FR 32058)).

d. Key dependent measures: (1) Product comparison task, measured both accuracy and time; (2) judgments of front panel nutrition claims; (3) judgments of nutrients that need to be balanced in the diet after eating product; (4) product healthfulness ratings before and after seeing nutrition label; (5) estimate of how many servings of product needed to meet daily requirement; (6) preference for most liked/least liked format out of the four seen, with stated reasons for choices.

e. Assessment/comments: Formats presented as two dimensional nutrition labels of realistic size but not on packages. All formats not tested on product comparison task. FDA Study 1 data used to impute product comparison performance for Control and Adjective formats. Percent DV/With DRV used as proxy for Percent DV/Without DRV on product comparison task.

5. Geiger Study (Ref. 72)

a. Design: Repeated measures within subject; subjects assigned to one of two format sets of either five or six formats.

b. Subjects: Shopping mall intercept/central location test, one site, eligibility requirements not specified, N=243.

c. Formats Tested: 11 formats including versions of Control, Control/DRV, Percent DV/With DRV, Percent DV/Without DRV and versions with adjectives, bar graphs and various combinations of these design features.

d. Dependent measures: (1) Reading accuracy; (2) number-of-serving type questions; (3) perceived usefulness of various formats based on a conjoint measurement procedure-equivalent to preference for large choice set.

e. Assessment/comments: All formats executed on same product. Learning effects across repeated measures may confound format effects on performance measures—the same information is available on all formats. Correct answers to number-of-serving type questions are not clearly defined.

6. Byrd-Bredbenner (Ref. 73)

a. Design: Repeated measures within subject; seven format cells.

b. Subjects: Supermarket intercept, 15 sites in same geographic area, food shoppers 18+, age and education quota controls, health and nutrition-related workers excluded, N=309.

c. Formats tested: seven formats including versions of Percent DV, Adjective, DRV Listing and Control in various combinations.

d. Key dependent measures: (1) Hybrid scale consisting of number-of-serving type questions and product comparison questions; (2) scale consisting of product comparison questions; (3) preference ratings of most helpful/least helpful with stated reasons.

e. Assessment/comments: Products confounded with formats. Order of format presentation partially confounded with amount of information in format.

7. Burton (Ref. 75)

a. Design: Between subjects, 4(formats) X 3(reference values: none/daily/meal) X 2(high/low nutrient values).

b. Subjects: Recruited for a university sponsored project by letter, cross-section of adults, n=500.

c. Formats tested: Versions of Control, Adjective and Percent DV with and without different versions of a DRV listing.

d. Key dependent measures: (1) Product ratings: bad-good, not nutritious/very nutritious, purchase intentions; (2) number-or-serving type measure; (3) rank ordering of formats on quantity and quality of information.

e. Assessment/comments: Well controlled study.

B. Survey Studies Submitted

1. AHA Quantitative Study (Ref. 87)

a. Design: Central location test, details unspecified.

b. Subjects: N=405.

c. Relevant format topics: Frequency of reading back of food labels, magnitude estimation of amount of fat in product, awareness of calorie base for fat, knowledge of how to adjust Fat DRV if person eats less than 2,350, likelihood of using information on food label to help reduce fat intake.

d. Assessment/comments: Most of the survey is devoted to issues related to use of the word "healthy" on food labels.

2. CSPI Study (Ref. 95)

a. Design: National probability sample of telephone households.

b. Subjects: N=2,008 adults, assigned to one of eight versions of magnitude estimation question.

c. Relevant format topics: Magnitude estimation of fat amounts in product.

d. Assessment/comments: Fat is the only nutrient considered.

3. American Meat Institute/Roper Study (Ref. 96)

a. Design: Multistage, stratified national probability sample of households, in home interviews.

b. Subjects: N=2,000, males who shared food shopping responsibility equally with other people in the household were selected when possible, otherwise any food shopper available from household was selected.

c. Relevant format topics: Attitudes and behavior regarding food labels, understanding of "RDA" and "DRV."

d. Assessment/comments: A comprehensive survey on food labeling issues.

4. Kellogg Study (Ref. 97)

a. Design: Not a probability sample, subjects call toll-free number for some product-specific reason.

b. Subjects: N=272, unknown characteristics.

c. Relevant format topics: Understanding of DRV, knowledge of how to adjust DRV for varying calorie needs, rated helpfulness of DRV information.

d. Assessment/comments: Sample characteristics are unknown.

5. GMA/NFPA Industry Study (Ref. 71)

a. Design: Central location test (see description above). Questions that were asked before subjects saw any food label formats or questions that did not involve use of formats are considered survey questions.

b. Subjects: See description above.

c. Relevant format topics: Frequency of reading food labels, frequency of various uses of food label information, understanding of DRV concept.

d. Assessment/comments: Large sample, detailed questions about possible label uses, DRV questions are asked after respondents have been exposed to particular food label formats, subjects exposed to Control format are not asked DRV questions, only 4,790 respondents are asked the DRV questions.

6. National Consumers League (Ref. 98)

a. Design: National probability sample of telephone households.

b. Subjects: N=1,139, 1,007 who read nutrition labels at least sometimes complete full questionnaire.

c. Relevant format topics: Frequency of reading food labels, reasons for reading food labels.

d. Assessment/comments: Most of the survey is devoted to issues related to use of the word "healthy" on food labels.

C. Focus Group Studies Submitted

1. FDA Study 1 (Ref. 85).
2. FDA Study 2 (Ref. 86)
3. Geiger (Ref. 72).

4. AHA Study 1 (Ref. 87).
5. AHA Study 2 (Ref. 87).

D. Informal Preference Polls

1. COSTCO Newsletter (Ref. 88).
2. Washington Post (Ref. 89).
3. Nutrition Action Newsletter (Ref. 90).
4. USA Today (Ref. 91).
5. Daily Herald (Ref. 92).
6. Atlanta Constitution (Ref. 92).
7. New York Times (Ref. 94).

The studies vary greatly in the issues addressed, methodology, sampling, types of nutrition formats studied, types of evaluation measures used to assess formats, and degree of control used in the research. Many of the consumer studies submitted or referenced in comments about nutrition label formats were based on recently conducted research studies and on interpretations that had not yet appeared in the scientific literature.

FDA considers the findings of research studies submitted in comments to constitute an important separate class of comments for purposes of evaluating various nutrition label formats. Research findings based on specific measures need to be considered as distinct from conclusions based on combining findings across several different measures. Research findings also need to be considered in the context of a body of similar research to evaluate consistency in the pattern of effects across studies (e.g., reliability) and consistency in the identification of important controlling factors (e.g., validity). Comments offering conclusions based on research findings are discussed below in the relevant sections. In this section, the research findings themselves are discussed in terms of methodologies used, types of evaluation measures, consistency of effects across studies, the strength of effects, and implications for the design of the nutrition label format. The agency believes that to clarify its reasons for decisions about the nutrition label format that rely on research findings, it is necessary to articulate its understanding of the relevance, reliability, and relative significance of the various research findings.

To facilitate discussion of research findings, FDA considers it useful to distinguish among three primary types of evaluation measures used to assess nutrition label formats: Performance measures based on label use tasks, consumer preference judgments of various formats, and questions about consumer understanding of selected elements of possible nutrition labels, such as Daily Values (DV's) (called in the format proposal DRV's). Each type of evaluation measure has a different relevance to the selection of an improved format for the nutrition label.

2. Performance Measures Based on Specific Label Use Tasks

As a rule, different tasks and performance measures have been used to evaluate how well a format meets the different primary performance objectives specified in the 1990 amendments. These objectives as discussed in section V.B. of this document are: (1) To enable consumers to readily observe the nutrition information, (2) to enable consumers to comprehend the nutrition content of the particular product, and (3) to enable consumers to understand the relative significance of product nutrition information in the context of a total daily diet. (Objectives (1) and (2) are closely linked for testing purposes and will be frequently discussed together in this document). In the research reviewed by FDA, measures to evaluate formats in relation to these objectives have appeared only in experimental studies, probably because this type of measure requires a substantial degree of control over the conditions under which such measurements are taken.

For performance measures based on specific label use tasks, respondents are asked to perform a task using the information from a nutrition label. The task is constructed so that a performance measure can be defined (e.g., speed, accuracy, likelihood of giving appropriate response), indicating the degree to which the respondent can readily observe and comprehend product label nutrition information or "understand its relative significance in the context of a total daily diet."

a. *Product comparison tasks.* The type of tasks most commonly used to evaluate formats with respect to the objective of enabling consumers to readily observe and comprehend product nutrition information were product comparison tasks. These tasks presented respondents with two or more product labels simultaneously and asked them to engage in a relatively simple information search (e.g., find differences between the products, identify which product is higher or lower in a certain nutrient) where answers were scored correct/ incorrect and timed.

104. The product comparison type of task was employed by the two FDA format studies (Refs. 69 and 70) and by three other studies submitted in comments to the format proposal (Refs. 71, 72, and 73). One study (Ref. 72) simply asked respondents to read certain information from a product label and scored whether they gave the correct answer.

Performance levels on product comparison tasks were high, with most of these studies finding accuracy levels of 70–90 percent correct.

The product comparison type of task tended to produce consistent format effects. The most consistent finding, replicated in all studies, was that simple formats that have clean, nonredundant displays of nutrient information per serving worked best in this kind of task. Because it has the least amount of information, the current format performed well on product comparison tasks. But several studies (Refs. 70, 72, and 73) found that other ways to display nutrient information per serving, using either g/mg amounts or percent DV declarations, were equally effective when the format was executed with a clean and uncluttered appearance.

Multiple column nutrient information per serving displays were much more difficult than single column displays for consumers to use for product comparisons. Several studies (Refs. 69, 70, and 71) found that product comparison performance dropped sharply for labels using the "as packaged/as prepared" dual declaration format. Both the major industry format study and FDA's first experimental format study found that declaring nutrient amounts per serving in adjacent columns of g/mg amounts and percent DV led consumers to make more mistakes and to take longer on the product comparison type of task. FDA's second experimental study, however, showed that when g/mg nutrient amount information was placed immediately next to the nutrient name in an unordered array, and percents were placed in a column array, the adverse effects on product comparison performance disappeared.

Most studies found that the addition to the label of a listing of the DV's for some or all nutrients did not greatly affect the ability of consumers to use the nutrition label for product comparison purposes. Similarly, the use of a highlighting or grouping scheme on the nutrition label neither impaired or improved respondents' performance of product comparison tasks.

The use of adjectives on the nutrition label did appear to cause respondents to miss nutrient differences between products when the adjectives used to describe the nutrient for each product were the same. Several studies (Refs. 69, 71, and 73) found that formats using adjectives did not perform as well as formats without adjectives on product comparison tasks.

FDA considers this product comparison type of performance measure to be a valid and reliable indicator of how well a given format's information can be readily observed and comprehended. The major conclusions that FDA drew from this research are that: (1) Clean, uncluttered nutrition label formats work best, (2) dual column declarations of nutrition information per serving make it harder for consumers to readily observe and comprehend nutrition information, and (3) adjective formats lead consumers to miss quantitative differences between products when different nutrient levels are characterized by the same adjective. The formats that FDA tested (Refs. 69 and 70) that were effective on product comparison tasks included the CONTROL, CONTROL/DRV, PERCENT, PERCENT/DRV, GROUPING, and HIGHLIGHTING.

b. *Dietary judgment tasks.* A different type of task was used to evaluate formats with respect to the second performance criterion, enabling consumers to understand the relative significance of product nutrition information in the context of a total daily diet. Most of the dietary judgment tasks presented respondents with one product label at a time and asked them to make a dietary judgment about the product (e.g., how likely they would be to eat the product if they were trying to limit/increase a specific nutrient in their diet; what nutrients they should try to cut back on/get more of in other foods they eat that day after eating three servings of the product; whether they consider a high/low nutrient claim for the product to be correct/incorrect). Respondent dietary judgments were then scored as correct/incorrect or appropriate/ inappropriate.

105. This type of dietary judgment task was used in the second FDA format study (Ref. 70) and two industry studies (Refs. 71 and 74). Measures based on dietary judgment tasks produced consistent format effects. The most consistent finding, replicated by all these studies, was that providing adjectives to describe nutrient levels per serving or declaring nutrient levels per serving as percentages of the nutrient DV helped respondents to make correct and appropriate dietary judgments relative to formats where nutrient levels were declared in g/mg amounts. These studies found that other nutrition label format design elements, such as inclusion of a listing of DV's, highlighting, or grouping nutrients on the label, did not improve performance on these types of dietary judgment tasks.

A consistent finding across two studies (Refs. 70 and 71) was that percent DV declaration had a moderating effect on dietary judgments relative to formats without percent DV declaration. Respondents were less likely to consider a given nutrient level unacceptably high or to say that they would avoid the food entirely because of its nutrient levels when the amount per serving information was presented as percent DV.

Performance levels on this type of dietary judgment task ranged from 45 to 80 percent correct across studies.

FDA considers that how well consumers are able to judge the magnitude of specific nutrient levels as measured by this type of dietary judgment task is a valid and reliable indicator of how effectively a given format helps consumers to understand the significance of product nutrition information in the context of a total daily diet. The major conclusions that FDA drew from this research are that: (1) The declaration of nutrient amount information as percentages of DV or the placement of adjectival descriptors next to the nutrient amount information are both effective ways to help consumers understand the significance of product nutrition information in the context of a total daily diet, (2) percent DV declarations moderate dietary judgments about a food, and (3) other format elements, such as a list of DRV's for important macronutrients, highlighting, or grouping nutrients according to dietary guidelines, do not help consumers make better dietary judgments. The formats that FDA tested that were effective on this kind of task were the PERCENT DV, PERCENT DV/ DRV, and ADJECTIVE.

106. Several comments on the format proposal recognized that the ADJECTIVE and PERCENT DV formats have benefits to consumers for dietary judgment types of tasks. They argued that both of these format design elements correct a common tendency to misjudge the magnitude of specific nutrient levels when they are given in g/mg amounts. The comments asserted that consumers make such errors because they tend to use a single numeric standard to estimate magnitude.

The comments stated that when nutrient amounts per serving are declared in g/mg amounts, the numbers appearing on the label cannot be used as guides to estimate the relative magnitude of nutrient levels in the product. These comments continued: A reasonable reference standard for one nutrient is quite different from the reasonable reference standard for another nutrient. For example, 5 g is a high level for saturated fat, but 100 mg is a low level for sodium. Because the nutrients on the label vary greatly in terms of reference standards, the common tendency of consumers to use a single numeric standard when nutrient amounts are declared in g/mg units leads to flawed dietary judgments.

Percent DV declarations, by contrast, display nutrient amounts per serving in comparable units, and this type of display facilitates the appropriate use of a common numeric reference standard for all nutrients. Adjectival descriptors also serve to translate nutrient levels into comparable units by describing disparate nutrient amounts per serving in easily understood ordinary language terms.

FDA agrees that this reasoning provides a plausible explanation of the research finding that percent DV declarations and adjectives help consumers make more appropriate magnitude estimates of nutrient levels in a product.

c. *Number-of-servings calculation tasks.* Some studies employed a one-product task where respondents were asked to estimate how many servings of the product were needed to meet a daily requirement for a certain nutrient. FDA considers this number-of-servings type task to be relevant to consumers' abilities to use product information for meal planning and quantitative dietary management purposes that are properly considered part of placing the product in the context of a total daily diet.

107. This type of performance measure was used in the second FDA format study (Ref. 70) and in four other studies submitted in comments to the format proposal (Refs. 71, 72, 73, and 75). The number-of-servings type of performance measure did not show consistent format effects across studies, possibly because of variations in stimuli and procedures between studies.

One well controlled study (Ref. 70) found that the current nutrition label format was the worst format on this type of performance task, but a less well-controlled study (Ref. 72) found that the current nutrition label was among the best formats on the number-of-servings type of task. One study (Ref. 70) that asked for a numerical answer found that PERCENT DV formats performed almost as well as the best formats on this measure, but another study (Ref. 71) that asked the respondent to articulate the computation process found that PERCENT DV formats were much worse than the best performing formats.

In all studies, performance levels on the number-of-servings calculation task were noticeably lower than for the kinds of tasks discussed above. Performance levels ranged from 10 to 50 percent

correct across studies. All studies found that this type of task was highly sensitive to respondents' education levels and arithmetic sophistication.

FDA considers this type of performance measure to be relevant to how well a given format serves to place product information into the context of the total daily diet, particularly with respect to the role played by including a listing of the DV's on the label. However, a lack of consistent results across studies and low levels of consumer competence to perform the required computations suggests that this measure be considered of secondary importance for evaluating nutrition label formats.

d. *Single product rating tasks.* Some studies showed respondents a product label in a given format and asked them to rate the product on healthfulness or to rate purchase intentions toward the product. The measure compared ratings made after seeing front panel information consisting of nutrient or health claims and ratings made after being exposed to product information on the nutrition label.

108. This type of measure was used in the second FDA format study (Ref. 70) and in one other study submitted as a comment (Ref. 75). Both studies showed a consistent effect: Consumers relied more heavily on back panel than front panel nutrition information when making general judgments about a product. They become more negative toward the product after seeing the back panel nutrition information relative to an initial impression based on front panel information alone. Neither study found that the format of the nutrition label had much effect on this type of measure.

Because it appeared insensitive to format effects, FDA does not consider this type of single product rating comparison to be an important consideration for evaluating how well a format meets the criteria specified by the 1990 amendments.

e. *Measures based on two or more types of tasks.* Some studies defined scales that combined more than one type of performance measure, such as product comparison questions and number-of-servings questions. Where possible, FDA considered these scales to represent only one of the composite measures, the one they most resembled, so that they could be discussed in the appropriate sections above. Such measures were evaluated by comparing results with other measures from the same study and with measures from other studies which utilized similar elements.

109. One study (Ref. 73) submitted as a comment to the format proposal reported results for a scale based on product comparison questions and number-of-servings questions (discussed in section V.D.2.a. and V.D.2.c. of this document). In this instance, the results showed that format effects on the scale were quite different from format effects on a different scale in the same study which was clearly made up of product comparison questions. Therefore, FDA considered this scale to be an example of the number-of-servings type of performance measure.

110. Another study (Ref. 74) reported results for a scale based both on number-of-servings type questions and dietary judgment type questions. Examination of the results for this scale showed that the performance findings most resembled findings from other studies based on dietary judgment questions. Therefore, FDA considered this scale to be an example of a dietary judgment performance measure.

3. Preference Judgment Measures

In the research reviewed by FDA, consumer preference judgments of various formats were primarily choice measures based on a direct or implied question to respondents about which of some given set of possible examples of nutrition label formats would be most helpful, most useful, or would work best for consumers. Measures of this type occurred in all research modalities and were often the principal measures in focus group and informal preference poll research. Because respondents were typically asked to express a relative preference, the set of choices presented to respondents influenced the selection process and thereby constitutes an important limitation on the validity of this type of measure.

Preference measures are not of the same order as behavioral measures, which address how well a given format performs in a given label use situation. Stated preferences for formats reflect a respondent's implicit theory about what kind of format generally works best. Judgment in these instances is abstracted from any particular product or any particular label use situation.

An extensive scientific literature review suggests that untested theories about the amount and type of information that are most useful to consumers are sometimes wrong (Refs. 76, 77, 78, 79, and 80). In particular, studies of preference for nutrition information have generally shown that consumers prefer the largest amount of information offered (Refs. 81, 82, and 83) but perform best with limited amounts of information specifically related to the task (Ref. 84).

a. *Experimental studies.* 111. Both FDA format studies and three other studies submitted as comments on the format proposal employed relative choice measures of format preference based on choosing a most preferred or least preferred format from the set of formats being evaluated in the study (Refs. 69, 70, 72, 73, and 75). Direct comparisons between studies are difficult because no two studies used exactly the same choice set of formats.

Despite differences between studies, there were basic consistencies in the pattern of preference results across studies. In every case, respondents tended to prefer the format with the most information in the choice set and tended to dislike formats with the least information in the choice set. The addition of a listing of DV's to the nutrition label for some or all of the nutrients was seen as more informative, and was always highly preferred, over alternatives lacking a listing of DV's. All of the studies that asked respondents to give reasons for their selection of a certain format (Refs. 69, 70, and 73) found that providing more information was one of the most common reasons given.

Other format features in addition to a DV list that were viewed positively relative to formats without such features were adjectives, bar graphs, highlighting, and, to a lesser extent, grouping and declaring nutrient amount per serving as percent of a DV.

All studies that included both performance and relative preference measures (Refs. 69, 70, 72, 73, and 75) found little or no consistency in the pattern of format results across performance and preference measures. For studies that included performance measures of the product comparison type (Refs. 69, 70, 72, and 73), the common finding was an inverse ordering between formats that were preferred and formats that performed well on this type of task.

Two experimental studies (Refs. 71 and 74) varied formats between subjects such that each subject saw a single format and rated only that format. One study (Ref. 74) asked respondents to rate the helpfulness, ease of use, and adequacy of information of the single format. The other study (Ref. 71) asked respondents to rate ease of use and adequacy of information. Neither study found that respondents gave the highest ratings to the format with the most information. A format similar to the current format that did not include a listing of DV's for some nutrients was

among the highest rated formats in both studies.

In one study, respondents expressed suspicion toward formats using adjectives (which provided relatively more information), apparently because they felt the company was deciding how and when the adjectives were used. In the other study, respondents were more negative toward formats using percent DV declarations. However, in the latter study, the PERCENT DV formats were executed with extra columns of information, so that a single nutrition label had as many as four numeric columns. Respondents in this study considered the PERCENT DV with DV list format to provide more information than was desirable.

FDA is convinced by these results that consumer preferences for various nutrition label formats were very sensitive both to the set of formats the respondent was asked to compare and to the particular methodology used to measure preference. Moreover, preferences did not correspond to objective measures of format performance. This lack of correspondence raises serious questions about the underlying validity of such measures, even though respondents were asked to base preferences on which formats they thought would work best. Given these methodological problems and the apparent lack of validity, FDA considers preference measures to be of secondary importance for decisions about the nutrition label format.

b. *Focus group studies.* Research using focus group discussions about nutrition label issues elicited preferences for various kinds of format design elements by showing the group examples of different formats and asking them to discuss their reactions.

112. The two FDA focus group studies and three other focus group studies submitted as comments on the format proposal discussed the groups' reactions to various format elements (Refs. 72, 85, 86, and 87). In every study, respondents indicated strongly that they would like more information on the nutrition label, particularly with respect to helping them understand whether given nutrient levels could be considered high or low. A listing of DV's for some or all nutrients was always among the most preferred additions to the nutrition label. Other format design features favorably mentioned in some or all of the focus group studies were bar graphs, percent DV declarations, and percent of calorie declaration for macronutrients. Other features, such as adjectives or pie charts, received some favorable mentions, but fewer than the above features.

Respondents in focus group discussions often stated they would like to see a simpler and easier to use label than the current nutrition label. One focus group study (Ref. 85) asked respondents to consider in detail how they might use certain format features and found that pie charts and bar graphs were seen to be hard to use. Formats using adjectives were sometimes criticized because of suspicion about who decided how and when the adjectives were to be used.

FDA considers the focus group preference results to be consistent with the preference results of experimental studies.

c. *Informal preference polls.* Many comments from the general public were generated by articles in newspapers and newsletters that solicited consumer opinions in the form of informal polls based on examples of possible nutrition label formats. FDA considers such articles to be informal preference polls and therefore a form of research. FDA recognizes limitations on the validity of such research: respondents are highly self selected, no background information about respondents is available, responses are influenced by the accompanying news article, and responses depend on the choice set of formats given in the article. FDA has tried to identify the actual articles and the choice sets of formats presented to readers in interpreting these comments.

113. FDA identified seven informal preference polls that generated comments on the format proposal (Refs. 88, 89, 90, 91, 92, 93, and 94). One informal preference poll conducted by a consumer buying club in its newsletter (Ref. 88) asked consumers to rate their preferences toward three formats taken from FDA's research formats: ADJECTIVE, HIGHLIGHTING, and GROUPING. Over 400 responses were received. Seventy percent of the responses favored the ADJECTIVE format.

A midwest newspaper (Ref. 92) published examples of all seven formats used in FDA's format study 2 and asked readers to indicate which one they preferred. Approximately 100 responses were received. Sixty-five percent of the responses favored the ADJECTIVE format.

A consumer group newsletter (Ref. 90) published an example of a recommended format that included adjectives and a listing of DV's for macronutrients and asked readers to respond to FDA in support of the recommended format. Approximately 130 responses were received in support of such a format.

A nationally distributed newspaper and a regional newspaper (Refs. 91 and 93) published an example of a graphically enhanced PERCENT DV with DRV format (Appendix C from the format proposal). Approximately 40 responses were received. Sixty-five percent of the responses disapproved of the published format.

A major eastern newspaper (Ref. 89) published examples of four formats taken from the format proposal; PERCENT DV with DRV (Appendix C), CONTROL with DRV Ranges (Appendix E), CONTROL with Sex-Specific DRV (Appendix E), and CONTROL with Dietary Guidance (Appendix F). It asked readers to respond to FDA with their preferences, and approximately 450 responses were received. Two formats (CONTROL with DRV ranges and CONTROL with Sex-Specific DRV) were most preferred overall, each by approximately 35 percent of respondents.

FDA considers the results of informal opinion polls to be consistent with the preference results observed in experimental studies and focus groups. Most consumers say they prefer the format with the most information out of the set of formats they are asked to evaluate. However, FDA is not convinced that formats that have more information are necessarily the formats that best meet the criteria specified in section 2(b)(1)(A) of the 1990 amendments.

4. *Measures of consumer understanding.* Some of the research submitted or referenced in comments to the nutrition label format proposal consisted of survey questions about consumer understanding of various elements of proposed nutrition labels (Refs. 71, 87, 95, 96, 97, and 98). Some of these questions addressed topics such as whether consumers use nutrition labels and, if so, for what purposes. Other questions addressed the concept of a DV: how consumers understand it, whether they can use it, how they might use it, or whether they are aware of it. A third type of question about consumer use of format elements was how consumers assign magnitude estimates to nutrient levels.

FDA considers this kind of research about format elements to provide an important context for the decision about an improved nutrition label format. Although it does not directly address the format objectives specified by the 1990 amendments, this research does provide some insight on how consumers understand and use the nutrition label.

a. *Survey questions about consumer use of nutrition labels.* 114. Four surveys submitted as comments on the format proposal (Refs. 71, 87, 96, and 98) asked questions about how often respondents read nutrition labels and ingredient information on food packages. These studies consistently found that approximately 70 to 80 percent of consumers report that they read this information almost always, often, or sometimes. These figures are consistent with a number of other surveys (Refs. 99 and 100) that asked similar questions.

In several studies submitted as comments, consumers were asked about specific purposes for reading nutrition labels. One study (Ref. 71), which asked 5,600 respondents detailed questions about possible label uses, found that the most common purposes for reading nutrition labels were: To calculate how high or low the product is in certain nutrients, to get a general idea of nutritional content, to compare different types of food products, and to help determine brand choices. The least common purposes for reading nutrition labels were to help in meal planning or to figure out how much of the product you should eat.

Other submitted studies reported results consistent with these findings. Specifically, one study (Ref. 96) found that only 7 percent of those who read nutrition labels did so "to help in planning a specific meal." Another study (Ref. 87) found that 83 percent of respondents would be very or somewhat likely to use information on the food label to help reduce fat intake.

FDA considers the results of these questions about consumer uses of nutrition labels to show that consumers are already using nutrition labels for purposes that are consistent with the format objectives of the 1990 amendments. Indeed, the two most common types of reported uses: (1) To evaluate nutrition characteristics of single products and (2) to assist in making choices between products, correspond well to the two primary criteria specified for formats in the 1990 amendments. The agency believes that the introduction of a revised nutrition label and accompanying educational activities will have a significant impact on use of the nutrition label for these purposes in the future.

b. *Questions about Daily Values.* 115. FDA received a number of studies as comments on the format proposal that asked questions related to consumer understanding of the concept of DV's. One study (Ref. 96) reported that 22 percent of respondents said that they were familiar with the term "Daily Reference Value" or "DRV" compared with 65 percent who said they were familiar with the term "Recommended Daily Allowance" or "RDA". Two studies (Refs. 87 and 97) found that only about half of respondents could correctly identify (i.e., read from the label) the DRV for a specific nutrient.

One study (Ref. 71) found that approximately two-thirds of all respondents considered the DRV to be appropriate for "everyone" or "most people." The same study found that 71 percent of respondents considered the DRV to apply to them personally. However, two other studies (Refs. 87 and 97) found that approximately two-thirds of all respondents stated that they understood that a DRV based on 2,350 calories would be high for a person who ate less than a 2,350 calorie diet.

One study (Ref. 87) showed respondents a label with a listing of DRV information and a footnote stating that DRV's were based on a 2,350 calorie diet. It found that more than half of all respondents could not correctly answer a question about the number of calories on which the DRV was based.

FDA considers results of questions about consumer use and understanding of DRV's to be tentative and likely to change because the public's exposure to the concept has been very limited, and educational activities to explain the concept have not been undertaken. The experimental format research (see section V.D.2. of this document) did not find that listing the DRV's on the nutrition label had much effect in a positive or negative direction on label uses that required evaluation or comparison of specific products, although it did improve calculation of number of servings needed to meet a daily requirement. None of this research, however, evaluated the impact of listing the DRV's on the food label on consumers' overall dietary management behavior, either alone or in conjunction with possible education initiatives.

FDA concludes that in the absence of reliable guidance from research findings, it has to rely on other comments to evaluate the potential value of listing the DRV's on the food label as a guide to better overall dietary management behavior.

c. *Magnitude estimation of specific nutrient amounts.* 116. Two studies submitted as comments addressed the issue of consumers' ability to make correct magnitude judgments about the level of a nutrient when told the amount. One study (Ref. 87) found that over one-half of all respondents considered 13 g of fat to be a large amount of fat.

A more detailed study (Ref. 95) asked respondents to estimate whether a given amount of fat in a product would be considered a low, medium, or high amount of fat. The amount of fat was systematically manipulated to determine how respondents assigned magnitudes across a range of values (7, 13, 20, and 33 g of fat). At the lowest level (7 g of fat per serving), approximately 20 percent of respondents considered the product to be high in fat. At the highest level (33 g of fat per serving), approximately 50 percent of respondents considered the product to be high in fat. The same magnitude estimation results were found when the amount of fat was expressed as a percentage of the DRV for fat. When amount of fat was expressed as a percentage of the DRV for fat, however, respondents were slightly less likely to give a "don't know/can't tell" answer than they were when fat amounts were expressed in g. Also, respondents were more likely to give a "medium" answer when the level of fat was expressed as 50 percent of the DRV instead of 33 g.

FDA considers these findings to show that consumers estimate nutrient level magnitudes of fat in a reasonable manner. However, the agency also concludes that a tendency exists for some consumers to see low fat levels as too high and other consumers to see high fat levels as less than high. More research is necessary to determine whether these results might be due to response biases inherent in the particular kinds of questions being used, or whether they reflect the different attitudes toward fat in the general population. FDA considers these findings to be consistent with the results of magnitude estimation measures used in experimental studies (see section V.D.2. of this document). FDA is convinced that an important consideration for decisions about the nutrition label format is whether the format helps consumers make appropriate magnitude estimations of nutrient levels in the product.

E. Criteria to Use in Judging Nutrition Labeling Format

Section 2(b)(1)(A) of the 1990 amendments specifies the requirements that an appropriate nutrition label format must meet (see Section V.C. of this document), but it does not specify how to weight these requirements with respect to various possible label uses or how to weight the various measures intended to evaluate alternate formats against the requirements. The 1990 amendments also do not specify how to balance the benefits of a revised

nutrition label against the practical limitations of small package sizes and the interests of many consumers, particularly older and less educated consumers, to have a highly legible label. In the format proposal, FDA requested comment on the criteria to use in judging nutrition label formats.

117. Most comments strongly supported the view expressed in the format proposal that a simple, uncluttered nutrition label is highly desirable. Comments from consumer groups and health professional organizations emphasized the benefits of a simple and uncluttered label for older and less educated consumers. Comments from food manufacturers and industry associations emphasized in addition that a simple, uncluttered format would allow greater flexibility to accommodate packaging constraints. Consumer research conducted by industry and by FDA demonstrated that simpler, less cluttered label formats help consumers to make comparisons between products.

FDA is convinced by the research results and these comments that a simple and uncluttered format is the best way for information on the nutrition label to be "readily observed and comprehended," as called for by the 1990 amendments. Accordingly, FDA is taking the steps discussed below to minimize the amount of information and the number of columns used on the nutrition label.

118. A number of comments from food manufacturers, consumer groups and health professional groups called for consistent label formats for both FDA and USDA regulated food products. The comments identified many benefits of having a uniform format for all food products including: (1) Making it easier for consumers to compare different kinds of products, (2) making it easier for consumers to become familiar with, and to learn how to use, the new labels, and (3) reducing the likelihood of consumer confusion because of apparent inconsistencies between different food labels.

FDA agrees that consistency between FDA and USDA regulated food labels should be an important consideration in decisions about the nutrition label format.

119. A number of comments from food manufacturers, consumer groups, and health professional groups argued that decisions about the nutrition label format should be informed by consumer testing, and that the agency should not propose formats that have not been tested. For the most part, these comments were directed at three label formats included in the format proposal that presented more elaborate listings of DRV's and more extensive educational footnotes than any of the formats included in FDA's previous nutrition label format research.

The agency agrees with the comments that emphasized the importance of consumer research in informing decisions about the nutrition label format. However, the agency is satisfied that most of the format elements that have been suggested for a revised nutrition label format have been sufficiently tested to permit research-based conclusions about their effects on consumer comprehension and label use behavior. The agency's view is that format elements that were less well tested, such as those suggested by the three formats described above, do not introduce sufficiently novel elements to the nutrition label to require independent testing. Information about the performance characteristics of more cluttered labels, listings of DV's, and elaborate footnotes is already available from extant research and can be extrapolated to estimate the performance characteristics of these particular formats as well.

120. The agency received a number of comments about the relative importance that should be assigned to product comparison versus dietary judgment measures of format performance in making decisions about nutrition label format. Many comments, primarily from food manufacturers and trade associations, argued that enabling consumers to compare the nutritional characteristics of food products is the fundamental use for the nutrition label and concluded that label formats should be evaluated mainly on this basis. Other comments, primarily from consumer groups and health professional organizations, gave more emphasis to the importance of the food label for helping consumers to make dietary judgments about the nutritional value of the food product that involve placing the product in the context of a total daily diet. These comments concluded that decisions about a nutrition label format need to take account of both product comparison measures and dietary judgment measures. The research on the reported frequency of different kinds of nutrition label uses showed that comparing products and assessing nutritional value are the two most important consumer uses of the nutrition label and are considered about equally important by consumers.

FDA is convinced by the research and by these comments that decisions about a nutrition label format should consider both types of label uses and evaluation measures rather than only one. Use of the nutrition label to compare products is dependent on the consumer's ability to comprehend the nutrition information, and use of the nutrition label to assess nutritional value is dependent on the consumer's ability both to comprehend the information and to understand its significance in the context of the total daily diet. Accordingly, FDA has considered these primary nutrition label uses in making decisions about the nutrition label format.

121. One comment from a health professional argued that consumer preferences for nutrition label formats should be considered as important as the ability of a format to achieve the format objectives specified in the 1990 amendments because a format that is more preferred will be more likely to be used by consumers.

FDA is not aware of any data that support the assertion that a more preferred label format will be more likely to be read. The agency's view is that people read the nutrition label because they are interested in what it says, not because they have an impulse to read the label based on its appearance. Actual ease of use, that is, the ease with which a consumer can extract needed information from the nutrition label, rather than preference for a format, is likely to influence the probability of reading a nutrition label. The consumer research shows that consumer preference for different label formats is, if anything, negatively related to actual ease of use (see sections V.D.2. and V.D.3. of this document). Therefore, FDA does not agree that preference should be considered as important as performance criteria for decisions about nutrition label formats.

122. One comment from a consumer organization argued that label uses should be weighted according to the likelihood that consumers engage in such uses. The comment recommended that less importance be given to label uses that assume that consumers will add up their daily totals of fat, saturated fat, or other nutrients because relatively few consumers are likely to engage in such difficult and burdensome monitoring. The comment suggested that many more people are interested in making qualitative judgments about individual foods, such as "is this food high or low in fat?" and recommended that dietary judgment measures assessing this aspect of label use be given the most weight in decisions about the nutrition label format.

Consistent with the comment, the consumer research did not show quantitative monitoring of dietary intake to be a common label use behavior.

However, it also did not show that making qualitative judgments about a food is the only important use of the nutrition label (see comment 114 of this document). FDA is convinced by the research that helping consumers to make qualitative judgments should be an important, but not overriding, consideration in making a decision about the nutrition label format. Other evidence shows that consumers use the nutrition label to compare products and to assess a product's nutritional value. Accordingly, FDA has considered facilitating qualitative judgments as one of the dietary judgment factors important for evaluating the various proposed formats.

F. FDA's Tentative View

In the format proposal, FDA presented its tentative conclusions about the elements that it will include in the final nutrition format and requested comments about them. The agency listed the following four elements as those that were likely to be included in the final nutrition format:

(1) The information must be presented in a manner that is simple and minimizes clutter.

(2) The information must be presented in tabular fashion, although perhaps enhanced by other graphic devices to provide rapid access to, and greater visibility of, key nutrition information.

(3) The nutrition information display must include either a listing of the quantitative amount of each nutrient, in absolute terms (e.g., g), or a listing of the amount as a percent of the proposed RDI or DRV, or both.

(4) Nutrient information must be linked to the dietary guidance that is considered important to public health.

123. Comments mentioning the first three elements were unanimously supportive. Comments mentioning the fourth element were generally supportive, although a number of comments argued either that the nutrition label cannot or should not be the primary vehicle for providing general dietary recommendations, or that educational materials should not appear on the food label at all.

The agency disagrees with statements that the nutrition label should not play a role in educating consumers. FDA is convinced that the nutrition label is an important source of basic information for consumers, and that the 1990 amendments require that the label facilitate consumer education. The agency's view of the educational role of the nutrition label is elaborated in section V.B. of this document.

However, the agency does agree that the nutrition label cannot be the primary vehicle for providing general dietary recommendations. Accordingly, as discussed later in this document, FDA, USDA, health professional organizations, and the food industry are developing a comprehensive consumer education program that will ease the transition to the revised nutrition label and help consumers to use the label to make well-informed dietary choices.

FDA points out that under the act, the requirement that nutrition information be linked to dietary recommendations need not require presentation of dietary guidance on the label. The House report that accompanied the 1990 amendments states, "While the bill does not mandate any particular approach, it does require the Secretary to specify requirements that would permit the consumer to understand the nutrition information pertaining to a particular food in relation to recommended dietary information" (Ref. 16). The declaration of nutrient amounts as percent DV provides such information. For the nutrient in the food for which a DV has been established, the percent DV advises the consumer how much of the recommended intake of that nutrient is provided by the food. Seen in this way, a requirement that nutrition information be linked to dietary guidance plays a greater role in describing the food than in presenting educational material.

G. The Format and Format Elements

FDA received approximately 1,000 responses to the format proposal and to a public meeting, notice of which was given in the *Federal Register* of July 23, 1992. Responses were received from consumers, health professionals, trade and retail associations, State and local governments, foreign governments, professional societies, consumer advocacy organizations, industry, and universities. Many of the comments selectively responded to issues of particular concern to the individual or organization commenting, but a large number included a reference to the specific formats favored or opposed.

1. Titles and Terminology

a. *Title for the nutrition label.* 124. A number of comments addressed the issue of the title for the nutrition label. The majority of comments supported retaining the current label heading "Nutrition Information per Serving." Comments suggested that consumers are familiar with this heading, and that the title is descriptive of the information that follows. One comment opposed the introduction of any new title because new terms are confusing. Another comment expressed concern that new titles have not been proposed or tested. Other comments suggested such terms as "Nutrition Information," "Nutrient Information," and "Nutrient Facts."

FDA acknowledges that the current title is descriptive and familiar to consumers. However, the agency also notes that the current title requires more space than several alternatives that are equally descriptive. The agency has concluded that modifying one of the suggested alternatives to "Nutrition Facts" yields a term that will clearly describe the information declared on the nutrition label. This more succinct term also allows the title of the nutrition label to use a larger typeface in the same space so that the nutrition label will be more readily noticed, and thus, more readily observed by consumers. Accordingly, in § 101.9(d), the agency is requiring that the term "Nutrition Facts" instead of "Nutrition Information per Serving," be presented as the heading of the nutrition information.

b. *Terminology for subcomponents of nutrients.* In its format proposal (57 FR 32070 at 32071), FDA solicited comment on certain format elements not addressed by research studies. The agency requested comment on what terminology and graphic elements would most effectively distinguish subcomponents of nutrients from the declaration of the total amount of the nutrient and improve their visibility in the nutrition label display.

i. Subcomponents of fat and of carbohydrate. 125. The majority of comments supported the use of the terms "total fat" and "total carbohydrate." Many comments suggested using indentation of subcomponents as a graphic means to further distinguish subcomponents because it is a commonly used technique that would be easily understood by most consumers. A few comments suggested bolding and highlighting of the broader classification to further distinguish subcomponents of fat and carbohydrate. Other comments suggested using such terms as "includes," "including," "of which," and "which includes" before the subcomponent to further establish that the subcomponent is a part of a broader classification.

Section 403(q)(1) of the act specifies that nutrition labeling shall include information on several nutrients, including total fat and total carbohydrates. In order to be consistent with the terminology used in the 1990 amendments, the supplementary proposal (56 FR 60366 at 60387 and 60388) included provision for listing "total fat" and "total carbohydrate" as mandatory elements of the nutrition label. Given the statutory derivation of

this terminology, the support for its use in the comments, the fact that the terminology reflects the broad category of nutrient, and the lack of opposition to the use of this terminology, the agency is retaining the provisions for the declaration of total fat and total carbohydrate based in § 101.9(c)(2) and (c)(6) and, by reference, in § 101.9(d)(7).

The agency agrees that indentation of subcomponents along with the use of the term "total" before the major classification provides effective means of establishing separate and recognizable subcomponent status. The agency is not providing for the use of terms such as "including" and "of which." While these terms may add clarity, they will also introduce additional words to the label, contributing to label clutter. The agency is persuaded by the comments that the use of indentation of subcomponents is sufficient to clearly distinguish the subcomponents of total fat and total carbohydrate because it is a commonly used and well understood graphic device. Therefore, the agency is requiring the indentation of saturated, polyunsaturated, and monounsaturated fatty acids in § 101.9(c)(2)(i) through (c)(2)(iii), respectively, and the indentation of dietary fiber, sugars, sugar alcohol, and other carbohydrates in § 101.9(c)(6)(i) through (c)(6)(iv), respectively, when such nutrients are declared. In addition, as explained in section V.H.1. of this preamble, the broader classifications must be highlighted by boldface print as provided in § 101.9(d)(1)(iv).

ii. Calories and calories from fat. 126. The plurality of comments supported using the term "total" preceding or following "calories" to denote that it includes the calories from fat (i.e., "total calories" or "calories, total"). Some comments suggested that a potential for confusion exists because "calories from fat" must be declared on the nutrition label, and consumers may be unaware that they are included in the larger category "calories." These comments expressed concern that consumers would mistakenly add calories from fat to the larger classification declared simply as "calories." Additionally, several comments suggested indenting "calories from fat" to further distinguish it from "total calories."

The agency is persuaded by the comments that the term "total" preceding or following "calories" will better enable consumers to understand that it is the larger classification of which the subcategory "calories from fat" is a part. The agency notes that it is requiring the term "total" for the other larger classifications, total fat and total carbohydrate. A label that has the term "total" preceding two of the three larger classifications may have the potential to confuse consumers with regard to the third. However, the agency also notes that the term "calories" has fewer words, and therefore requires less space and minimizes clutter. Furthermore, consumers have been seeing the term "calories" on labels to designate total calories, and, unlike the other nutrient subcomponents, the subcomponent "calories from fat" designates subcomponent status by its structure. Therefore, in § 101.9(c)(1), FDA is providing for the use of the terms "total calories;" "calories, total;" or "calories." In addition, in § 101.9(c)(1)(ii), the agency is requiring that the subcategory "calories from fat" be indented for consistency with other nutrient subcomponents when it is listed in a column under the total calorie information.

c. *Terminology for Daily Reference Value.* In its mandatory nutrition labeling proposal (55 FR 29487) FDA asked for comments concerning an appropriate single new term to be used to refer to all the reference values in the nutrition label. On its own, FDA arrived at "Daily Value (DV)" as a possibility for use as this single term. FDA used this term in the research that it conducted on formats. Most consumers correctly interpreted the general meaning of the term. However, during probing in focus group discussions conducted by the agency, several consumers commented that the word "value" may connote something of worth and suggested that another term might be appropriate for food labeling purposes. In its supplementary proposal published November 27, 1991 (56 FR 60366 at 60371), the agency reiterated its request for comment on, and suggestions for, appropriate terminology to be used to refer to the entire set of reference values.

127. A number of comments responded to the issue of terminology for a single term to denote all label reference values. Two comments stated that the word "value" may give the impression that these levels are goals to be achieved rather than points of reference. A wide range of alternative terms were offered, including "Human Daily Need," "Recommended Daily Standard," "Reference Value," "Daily Amount," "Reference Daily Intake," and "Recommended Daily Intake." However, no general agreement emerged from the comments, and no research data were submitted in support of suggested alternatives for the term "Daily Value."

One comment stated that the term "reference" has little meaning for most consumers, while a few others said that the use of the term precludes persons assuming that the value is a goal. Another comment stated that the term "standard" avoids the confusion of having to differentiate between minimum and maximum intakes. One comment suggested that the term "U.S. RDA" be retained to denote all label reference values. Many other comments requested retention of the U.S. RDA's; however, those comments appeared to be referring to retention of the current numerical values for the U.S. RDA, not the terminology to be used on the label.

FDA disagrees that the term "U.S. RDA" should be retained. The term was developed in 1972 when label reference values for all nutrients listed on the label were derived from the Recommended Dietary Allowances (Ref. 23). The term was developed to suggest the link between the Recommended Dietary Allowance and the label reference values developed by the agency. However, the reference values for a number of the nutrients that are to be included in the nutrition label, under the final rule on DRV's and RDI's, published elsewhere in this issue of the Federal Register, are not based on a Recommended Dietary Allowance value because the National Academy of Sciences has not established Recommended Dietary Allowances for these nutrients. It therefore would be inaccurate and misleading to retain the term "U.S. RDA."

Further, the agency believes that terms that use the words "recommended," "requirement," or "need" would be misleading to consumers and would complicate nutrition education efforts. Some of the reference values that FDA is adopting are intended to guide consumers relative to maximum intakes (for example, saturated fat), while others are intended to serve as a basis for planning general diets to meet nutrient requirements (for example, vitamin C) or as minimum intakes (for example, potassium). It would be incorrect to imply that FDA "recommends" that consumers consume the maximum intake level for total fats, or that such levels are "required" or "needed." Also, FDA cannot agree that the term "standard" is appropriate. While the comment argued that this term does not suggest a minimum or a maximum, the agency believes that it commonly implies a level to be achieved or surpassed, and for which it is undesirable to fall below. Thus, it may connote a minimum level for many consumers.

Moreover, the term "daily intake" suggests a requirement or prescriptive

need for individuals, rather than a general reference point. Furthermore, the agency is concerned that if the term were used, it could become a source of confusion in information and educational materials on nutrition because "daily intake" for nutrients is used to mean current consumption levels, rather than reference intakes based on dietary recommendations. For example, the current daily intake of fat is estimated to be 95 g per day based on food consumption surveys. However, the agency's DRV for fat is 65 g for a 2,000 calorie diet and is based on dietary guidance.

After reviewing the comments carefully, the agency concludes that it is appropriate to retain the proposed term "Daily Value." FDA research has shown that the term is generally understood by consumers as a point of reference, and no appropriate or well-supported alternatives have been suggested to the agency. FDA acknowledges that two comments suggested that the word "value" may be indicative of a goal. However, no data were submitted to support this suggestion, and no other comments objected to the term on these grounds. Therefore, FDA will use "Daily Value" as the single term to refer to all reference values on the nutrition label and is providing for its inclusion in § 101.9(d)(6).

To preclude any confusion, the agency points out that the Daily Values are a specific, regulatorily established set of reference values that have been derived based on dietary guidance and, for certain nutrients, on the assumption of a 2,000 calorie per day diet (see the document on RDI's and DRV's published elsewhere in this issue of the Federal Register). FDA recognizes that alternate daily caloric requirements (e.g., 2,500 calories) produce alternate recommended values for those nutrients with dietary recommendations that are based on calorie requirements, and that these alternate values can be considered "daily values" for people consuming the given calorie level. However, the recommended values for various calorie intake levels other than 2,000 calories per day should not be confused with the Daily Values, specifically the DRV's that FDA is establishing by regulation (see § 101.9(c)(7)(iii)) and that are referenced in several of the regulations that FDA is adopting today (see, e.g., § 101.13).

2. PERCENT DV Format

The majority of comments that supported the PERCENT DV or PERCENT DV with DRV format were from consumer groups and health promotion organizations, although several industry and other types of organizations also supported the proposed format. The majority of comments that opposed the PERCENT DV format were from industry.

128. The major argument given in support of the PERCENT DV format was that the percent formats are easy to use and provide clear information about how a food fits into a total daily diet. FDA's research showing that the percent formats have superior performance characteristics, particularly with regard to label tasks related to dietary judgments, was sometimes cited. Some comments argued that consumers are mainly interested in using the nutrition label to make qualitative judgments about specific foods, such as whether the food is low or high in a nutrient of interest. Many fewer people, it was argued, keep running lists of nutrient amounts throughout the day. The comments argued that the percent format facilitates this type of qualitative judgment.

Many of the comments opposed to the PERCENT DV format also addressed the issue of consumers' ability to use the PERCENT DV information, arguing that consumers would not be able to use percent displays effectively. Specific arguments included that the percent formats did not perform well in the Grocery Manufacturers of America and the National Food Processors Association (GMA/NFPA) industry study (Ref. 71), and that consumers do not understand percents.

FDA has carefully considered the arguments regarding percent displays but finds no basis not to conclude that consumers will be able to use PERCENT DV declarations more effectively than they would any other format tested. The consumer research (see section V.D.2. of this document) supports the assertion that the PERCENT DV format, with or without a listing of the seven macronutrient reference DV's, improves consumers' abilities to make correct dietary judgments about a food in the context of a total daily diet. This result was replicated in three separate studies (Refs. 70, 71, and 74), two of them industry-sponsored, and on three different dietary judgment tasks: judging the correctness of nutrient claims about the product, identifying the nutrients in the product that needed to be counterbalanced by changes in the daily diet, and judging how much to eat of the given food if you want to reduce intake of certain nutrients. In one industry-sponsored study (Ref. 71), the PERCENT DV format helped consumers judge how much to eat of a given food despite the fact that PERCENT DV formats were executed with extra columns of nutrient information per serving.

As noted in section V.D.2. of this document, the percent DV format element is one of only two format elements that have been shown to improve consumer performance on dietary judgment tasks (the other format element is the use of adjectives). In addition, the PERCENT DV format, when executed without additional columns, scored as well or better than any other format on all of the other tasks measured in FDA's study. No evidence was submitted to FDA showing that consumers cannot effectively use a PERCENT DV format when it is appropriately executed.

FDA studies (Refs. 69 and 70) found that for label use tasks involving simple comparisons between products, PERCENT DV declaration formats were best executed as single column displays with g/mg amounts next to the nutrient name and not in a column. Executed in this manner, no difference was found between PERCENT DV formats and the CONTROL format on product comparison tasks.

The GMA/NFPA industry study (Ref. 71) found that when the format was executed as two adjacent columns of numbers with different units (g/mg amounts and percent DV declarations), performance on simple comparison tasks was adversely affected. This result is likely attributable to the additional columns added to the format, particularly since the units differed, and is not an inherent weakness of the PERCENT DV declaration formats (see section V.D.2. of this document). FDA considers the placement of g/mg amounts in an unordered array next to nutrient names to be a necessary feature of the PERCENT DV format because it improves consumers' abilities to readily observe and comprehend the percent information on the nutrition label as demonstrated by FDA format studies. Thus, use of this format is consistent with section 2(b)(1)(A) of the 1990 amendments.

The argument that people have difficulty in understanding percents is not borne out by the consumer research. In the nutrition label situation, a consistent system of percents is used such that virtually all the nutrients on the label can be declared in equivalent units, in this instance percent DV. A list of nutrients declared in equivalent units has the unique property that the list of values is self-anchoring, that is, values in the list can serve as references for each other. A low value on the list is likely to be a "true" low value, a high value on the list is likely to be a "true" high value. This consistency is not possible when the list contains nutrients declared in very different units. Five g

of saturated fat may be a "true" high value and 115 mg of sodium may be a "true" low value, but few consumers see the number 5 as high and the number 115 as low according to FDA research. Percent DV declarations help consumers because they overcome the problems associated with declaring nutrients in nonequivalent units (see comment 106 of this document).

Gram/milligram formats with a list of DV's give consumers the numbers they would need to calculate percentages and thus to transform the amounts to equivalent numbers. However, research, including FDA's format research, has consistently shown that most consumers are unwilling or unable to transform data provided on labels (Refs. 70 and 101). Available evidence shows that providing consumers with raw data is not effective. Providing them with data in the form needed to make judgments, e.g., in consistent percentages, is effective.

Consumers have been seeing vitamin and mineral levels expressed as percent of U.S. RDA on food products for about 20 years. Few know what the U.S. RDA's are for specific nutrients or even know what units the U.S. RDA's are in. No arguments have been raised that percents in this context are difficult to use or hard to understand. The presentation of macronutrient data in percents is a logical extension of the system that consumers have been using with apparent success for years.

Therefore, FDA is requiring in § 101.9(d)(7)(ii) that nutrition information per serving be declared as percent of the DV in the primary columnar display on the nutrition label.

129. Many of the industry supporters of the PERCENT DV format cited the relatively small space requirements for the format, particularly if the DV listing is not required.

FDA agrees that the PERCENT DV format without a DV listing requires little additional space relative to the CONTROL format. A strength of the PERCENT DV format not shared by any other format except ADJECTIVE is that consumers can use it equally well for most label use tasks with or without the reference DV listing. For this reason, the agency is not requiring that the reference DV list be displayed as such. Rather, it is displayed as part of an example of recommended nutrient amounts for different calorie intake levels, and the normal placement is not beside the Percent DV information but beneath it.

In addition, the calorie-specific daily value list may be omitted in simplified formats and on small and intermediate sized packages (§ 101.9(f)(5) and (j)(13), respectively). In contrast, labels declaring amounts of nutrients only in g/mg units require consumers to compare the reference DV list with the amount declarations in order to make dietary judgments. Thus, for such labels, the presentation of the reference DV list adjacent to the declaration of amounts is necessary for most label use tasks.

Accordingly, § 101.9(d)(9) provides that daily values for 2,000 and 2,500 calorie diets be placed in columns beneath the vitamin and mineral information. However, if space is not adequate beneath the vitamin and mineral information, § 101.9(d)(11) provides that the calorie-specific daily value information may be placed to the right of the Percent DV information. In addition, § 101.9(f)(5) allows the calorie specific daily value information to be omitted from labels of products that qualify for the simplified format, and § 101.9(j)(13)(ii)(C) allows it to be omitted from packages with 40 or less square inches of label surface available to bear labeling.

130. A number of comments argued against the PERCENT DV format because of poor legibility of the basic format. They argued that legibility will be lower because the absolute amount declarations are hidden and are likely to be hard for consumers to find and because two numbers are required for each nutrient.

FDA disagrees that the basic format has poor legibility. The agency's research showed that consumers are easily able to use the PERCENT DV format displayed with amounts by weight in parentheses next to the nutrient name (see section V.D.2. of this document). Most consumers will not need to use the amounts by weight. The format prominently and clearly displays the one piece of nutrient information that will be most easily used and understood by the general population. The amounts by weight are provided for consumers who find it easier to use them, such as individuals who manage their diets using g/mg amounts.

131. Other comments argued that consumers will be confused because they will have to learn a new type of declaration, and those consumers used to the amount by weight declarations may mistakenly use the percentages as absolute amounts.

FDA disagrees with this argument. Evidence from consumer research shows that consumers generally are not able to effectively use the current format for some important label uses, such as placing a food in the context of their total daily diet (see section V.D.2.b. of this document). In contrast, research shows that consumers are able to use percent displays for all of the label uses tested, including those tasks related to dietary judgments, such as placing the food in the context of the total daily diet. As consumer education reaches more people, and as consumers become more familiar with the percent display format, its effective use will increase. In addition, under § 101.9(d)(7)(ii), as explained in section V.H.1. of this document, the symbol for percent (i.e., "%") must be used after each number. Therefore, consumers are not likely to use the percentages as absolute weight amounts.

Many of the comments opposed to the use of the PERCENT DV formats did not acknowledge that these formats provide g/mg amount information on the nutrition label. FDA included amounts by weight to meet the needs of consumers who had come to rely on such information. An appropriate balance must be achieved between how much and how prominently information can be presented on the label. The relative numbers of people likely to use different information is an important consideration in achieving this balance. Few people currently engage in the kind of dietary management that requires keeping daily running sums of particular nutrients, such as assumed by some of the comments opposed to PERCENT DV formats.

132. Several comments stated that PERCENT DV formats are misleading because they provide inappropriate dietary guidance or offer no guidance to those consumers whose daily requirements differ from the DV. Concern was expressed that consumers will believe the numbers apply to them personally.

The agency disagrees that PERCENT DV declarations are misleading because they provide inappropriate dietary guidance. A major advantage of a percent unit is that it communicates the relative magnitude of the nutrient level in a food without the consumer having to be concerned about the absolute level or units of the underlying scale being used. Knowledge of quantitative dietary goals for specific nutrients is not inherent in, or necessary for, accurate magnitude assessments of the nutrient levels in the food. The DV base of the percent does not have to exactly fit each individual's needs in order for the percent to accurately reflect the relative magnitude of the nutrient level in the product.

FDA considers estimation of the relative magnitude of nutrient levels in the food to be central to the placement of a food in the context of the total daily diet. FDA's research and other research submitted as comments to the format

proposal showed that consumers were able to use PERCENT DV formats to assess high/low levels of nutrients more effectively than any other format (see section V.D.2.b. of this document).Therefore, for purposes of placing the food in the context of a total daily diet, a label use for which consumers have no need to adjust the scale for individual variations, the declaration of nutrient amounts as percent DV cannot be considered misleading or inappropriate dietary guidance.

Although, for the reasons described above, detailed knowledge of the DV's and their relation to an individual's diet is not necessary for using a PERCENT DV format to make product comparisons or dietary judgments about the product, it is useful for other dietary management purposes. Information about how daily values vary by calorie needs will help those people who so desire to estimate their own personal daily values and will help them to differentiate the concept of a reference Daily Value used for labeling and regulatory purposed from personally appropriate dietary guidance.

Therefore, to decrease the likelihood of consumer misunderstanding, the agency is requiring in § 101.9(d)(9)(i) that a footnote accompany the percent DV declarations stating that these declarations are based on a 2,000 calorie diet, and that personal needs vary depending on an individual's calorie intake. In addition, to assist consumers in estimating their own quantitative dietary needs relative to the reference DV's, the footnote will display daily values of total fat, saturated fat, cholesterol, sodium, total carbohydrate, and dietary fiber based on 2,000 calories and 2,500 calories. By providing a concrete example of how individual dietary needs may vary depending on calorie intake level, the footnote will help people to place their personal dietary needs with respect to the reference Daily Values and to avoid any misunderstanding as to whether the reference DV's are dietary guidance meant for them.

133. Several comments argued that PERCENT DV formats are mathematically misleading because they are calculated against an implied range if the terms "or less" and "or more" are used, or because consumers will not be able to reconstruct the percents from the absolute amounts and the DV numbers because of the rounding rules for percents of macronutrients.

FDA disagrees that consumers will see qualifying terms such as "or less" and "or more" as constituting a range from which a percent cannot be calculated. These terms were included on the PERCENT DV/DRV format in the second FDA label format study, and no subject expressed confusion resulting from their presence (Ref. 70).

FDA agrees that the rounding rules for percents for macronutrients and sodium in proposed § 101.9(c)(12) (56 FR 60366 at 60390) have the potential to cause consumer confusion when used with the PERCENT DV format. The agency notes that the amount by weight declarations for these nutrients have already been rounded, and that additional rounding of the percents may lead to an undesirable degree of inaccuracy, depending on the specific percent.

Therefore, the agency is requiring in § 101.9(d)(7)(ii) that percent declarations for macronutrients, sodium, and potassium in the PERCENT DV/DV format be calculated by using as the numerator the actual amount of the specified nutrient before rounding for label declaration. The resulting proportion will be transformed to a percentage and rounded to the nearest whole percent.

134. Some comments argued that the PERCENT DV format should not be selected because the lack of DRV's for some nutrients will result in blanks in the principal numeric column. The comments argued that such blanks will leave consumers with no information about the level of some nutrients and will be confusing to them. However, none of the comments that supported the PERCENT DV format suggested that the lack of DV values for some nutrients was a disadvantage of the format.

Several of the comments that discussed the lack of reference values in the context of whether the DV list should be required on the label provided arguments that apply to all uses of the DV information and thus also apply to the PERCENT DV format. These comments argued that it is more beneficial for consumers to have the values for some nutrients than to have the values for no nutrients.

The agency disagrees that blanks in the principal numeric column resulting from the lack of DV's for some nutrients is sufficient reason to reject the PERCENT DV format. The g/mg amounts will be listed for nutrients that have no DV, so that some information will be presented for these nutrients. Since a reference value has not been set for these nutrients, none of the alternative formats would give additional information to help the consumer evaluate the food with respect to nutrients that lack a DV. For example, no value will appear in the DV listing for the nutrients, so comparison of the amount in the product with the DV, as might be done with the CONTROL/DV format, would not be possible. No scheme for assigning adjectives or for highlighting would be able to include nutrients without a DV, so that formats using these elements would not present more information about such nutrients than the PERCENT DV format. Since no other format overcomes the gap in information that results from lack of DV's for some nutrients, the lack of DV's for specific nutrients cannot be seen a reason to reject the PERCENT DV format. The agency agrees with the comments that argued that presenting DV related information for some nutrients is more beneficial to consumers than withholding such information about all nutrients.

135. Some comments argued that PERCENT DV formats are calculated against a base that will change as scientific knowledge about nutrition changes, just as dietary guidance changes as knowledge increases, and that, therefore, a PERCENT DV declaration should not be required.

These comments address the issue of putting on the label dietary information that will change over time with increasing knowledge. The underlying assumption of these comments is that percent DV declarations will communicate quantitative dietary goals for specific nutrients, but, as discussed above (see comment 132 of this document), FDA's view is that percent DV's are not likely to be used for this purpose. U.S. RDA's have been subject to change in the same sense, but this fact has not prevented their successful use on nutrition labels as a basis for declaring nutrient amounts as percentages. Therefore, the agency disagrees that the possibility of change is a substantial reason to avoid percent declarations on the nutrition label.

136. A number of comments argued that PERCENT DV formats encourage good/bad food judgments.

The agency does not agree with this argument. Both FDA and industry research found that PERCENT DV declarations tend to produce the most accurate judgments about whether products are high or low in various nutrients. The g/mg formats were more likely to lead to extreme and inappropriate dietary judgments than PERCENT DV declarations (section V.D.2.b. of this document and Ref. 102).

137. One comment expressed the view that FDA does not have the legal authority to require percentages, since the 1990 amendments only require the declaration of amounts. Others argued that the 1990 amendments do not mandate that FDA change the current format.

FDA disagrees with these comments. As discussed above, section 2(b)(1)(A) of the 1990 amendments requires that the nutrition information be conveyed in a manner that enables the public to understand the relative significance of the nutrition information in the context of the total daily diet. Moreover, the legislative history states that this provision requires the Secretary to specify requirements that permit the consumer to understand the nutrition information about a particular food in relation to recommended dietary information (Ref. 16, p. 18). Expressing the level of a nutrient in the food as a percent of a reference amount (the DV) is the simplest and most straightforward way of permitting the consumer to understand the amount of a nutrient in the context of the total daily diet. Thus, the 1990 amendments provide clear authority to require percentages. Moreover, given the requirements of the 1990 amendments, and particularly the requirement in section 2(b)(1)(A) of the 1990 amendments, revision of the current format is unavoidable and necessary.

138. A comment from a foreign government stated that PERCENT DV information is country-specific because the DRV information on which it is based varies by country, and mandatory inclusion of percent DV information on a label would make it difficult to achieve equivalence in nutrition labeling requirements between the United States and other countries. The comment noted that their free trade agreement with the United States requires that the two countries work toward equivalent requirements on nutrition labeling. The comment pointed out that Codex guidelines provide for supplementary nutrition information only on a voluntary basis.

The agency supports efforts toward international harmonization of food labeling. However, the 1990 amendments direct FDA to require a number of format elements that are not in harmony with international food labeling. The agency believes that it has been directed to require a format that will enable consumers to choose appropriate foods and to place the food within the context of their total daily diet, without the constraints of meeting international guidelines.

3. The DV List on the Label

a. *Including the DV list on the label.* A number of comments from industry, consumer groups, and health promotion organizations addressed the issue of whether the DV list should be required, optional, or not permitted on the nutrition label.

139. The major arguments supporting mandatory inclusion of the DV list on the label, made primarily by consumer groups and health professional organizations, were: (1) That the DV's must be listed for people to estimate how their needs may vary from those represented on the label, particularly if the individual is on a more restrictive diet than represented in the DV's, (2) that consumers need the DV information on the label because they have to become comfortable and familiar with the DV concept in order for them to use the new nutrition label to place the food in the context of their daily diet, to put nutrient content information in perspective, or to provide a frame of reference for decision making, and (3) that consumers need the information because quantitative dietary goals are necessary in order to encourage and help consumers understand proper dietary practices.

The major argument against inclusion of the DV list on the label, made primarily by food manufacturers and food industry associations, was that consumers will misinterpret the DV's as dietary recommendations for their personal dietary needs, which will lead to the DV's providing inappropriate dietary guidance. Comments argued that DV's are unacceptable for dietary guidance because they are population based reference values for an "average" consumer that do not take account of individual differences such as sex, weight, activity level, and other factors influencing personal dietary needs.

Many comments opposed to requiring DV's argued that a listing of DV's on the nutrition label provides no product-specific information to consumers, and that mandating the listing on all labels requires repeating the same information on millions of food labels. One comment likened the requirement of placing the list of DV's on food labels to a requirement that banks provide addition and subtraction tables to their customers in each and every monthly statement. Many of these comments argued that inclusion of a list of DV's on the nutrition label will significantly increase the space requirements of the nutrition label, and that the increased space needs will make it extremely difficult for small packages to comply with nutrition labeling requirements.

Many comments opposed the mandatory inclusion of the DV's on the nutrition label because it will clutter the label and thereby decrease consumers' ability to readily observe and comprehend the nutrition information on the label. A number of comments, particularly from industry, supported optional inclusion of the DV list. The arguments for making the listing of DV's optional were similar to those for opposing it.

The agency finds merit in the argument that presenting the DV list on the label may potentially mislead consumers by giving undue prominence to values intended as references only and not as dietary guidance for individuals. The consumer research (see section V.D.4.b. of this document) showed that consumers were likely to interpret a single list of values labeled as "Daily Values" as personally applicable. At the same time, the agency agrees with the comments that argued that consumers should be able to assess how their personal dietary needs, which vary by factors such as age, sex, and activity level, may differ from the reference DV's used on the label. After extensive consideration, the agency is convinced that the best solution to these conflicting requirements is not to list the reference DV's identified as such as part of the primary information, but to provide a footnote as specified in § 101.9(d)(9)(i) that gives individualized daily values of total fat, saturated fat, cholesterol, sodium, total carbohydrate, and dietary fiber based on 2,000 calories and 2,500 calories.

Without a prominent display of the list of reference DV's for macronutrients on the label, the likelihood that consumers will misunderstand the reference DV's as personally relevant dietary guidance is greatly reduced. At the same time, a concrete example of how recommended nutrient amounts vary depending on an individual's needs will help consumers to understand how their own dietary needs stand with respect to the reference Daily Values.

The agency believes that the information in the footnote will accomplish virtually all the benefits that comments identified would follow from including the list of reference DV's on the label. By enabling consumers to evaluate the appropriateness of the percent DV's for their personal needs, the information in the footnote will serve to increase consumer confidence in the nutrition label and lead to more effective use. For consumers who want to practice quantitative dietary regulation that involves setting intake targets for certain nutrients and keeping a running tally of intake of these nutrients, the information in the footnote will provide maximum flexibility in the use of the nutrition label. The percent DV's on the label can be adjusted for different personal needs or an individual's caloric intake either by working with the percentages (such as having a target value of 120 percent

for 2,400 calorie diet and a target of 90 percent for an 1,800 calorie diet) or by working from absolute values derived from the calorie-based daily values in the footnote. The footnote will yield these benefits without implying that a specific reference DV is the appropriate target for every consumer.

However, FDA also agrees with comments that point out that inclusion of DV-related information on the nutrition label, such as that in the required footnote, imposes significant costs in terms of label space without providing product-specific information. Considering the appropriate balance, FDA is convinced that the agency should be flexible in requiring the footnote on product labels, particularly since the benefits of having such a listing are not relative to the specific food that carries the information, and that the information will be available to consumers if it appears on a significant percentage of food labels.

Therefore, the information specified in § 101.9 (d)(9) and (d)(10) may be omitted from small and intermediate sized packages as provided for by § 101.9(j)(13), and from products that qualify for a simplified format as provided for in § 101.9(f)(5).

140. Comments also addressed the placement on the label of information intended as context to help people more effectively use the nutrition information of the label. In the proposal, this information was a listing of the reference DV's. The agency has considered these comments in deciding the issue of the placement of the information in the footnote that FDA is requiring instead of a listing of the reference DV's. Several comments suggested that the daily value information should be required to be listed in a column beside the percent DV information, not in a footnote. Some comments agreed that placement in a footnote is sometimes necessary and suggested that FDA require a listing on separate lines rather than in a string. Others also recommended that placement in tabular form be required. Many of the industry comments stated that, in order to accommodate daily value information on many packages, flexibility in placement is essential.

Because the PERCENT DV formats do not require consumers to use information about the reference DV values to perform product-related dietary management tasks, the agency believes that allowing some flexibility in placement of the calorie-specific daily value information and excluding small and intermediate sized packages and products with simplified labels from the requirement to provide the footnote information will not compromise the effectiveness of the format (see comment 128 of this document). As long as the information appears on a substantial percentage of food packages, it will be readily available to consumers. FDA recognizes that the added information requires increased label space and agrees that manufacturers should have flexibility to place it so that they can use available label space efficiently. Thus, in § 101.9(d)(11), FDA is providing that the footnote information may be placed to the right of the percent DV information when there is not adequate space to place it beneath that information.

b. *Lack of reference values.* In its final rule on RDI's and DRV's published elsewhere in this issue of the **Federal Register**, FDA has established DRV's for total fat, saturated fat, cholesterol, sodium, total carbohydrate, dietary fiber, potassium, and protein. However, the agency has not established DRV's for polyunsaturated fat, monounsaturated fat, other carbohydrates, sugars, sugar alcohol, soluble fiber, and insoluble fiber. Formats that include these nutrients will show missing values under the percent DV and the DV columns. In the format proposal (57 FR 32059 at 32070), FDA requested comment as to whether the missing values will cause consumer confusion and, if so, whether it would be helpful to place an entry in the column stating that a reference value is not available.

141. The comments were divided on whether the lack of reference values for some nutrients would be confusing to consumers. Several comments stated that appropriate educational efforts would reduce consumer confusion, and that the potential confusion possibly caused by missing values does not outweigh the usefulness of providing the percent DV and DV information for nutrients for which such values exist. Several comments suggested that it was most appropriate to merely leave the entry blank, citing concerns about label clutter and the need to keep the label simple. Other comments suggested that the format include an entry of some type to indicate that a reference value has not been established. One comment pointed out that it is current practice for some food and supplement labels to state that a U.S. RDA has not been established for some nutrients.

As noted in comment 134, the agency agrees that presenting DV information for some nutrients is more beneficial to consumers than withholding such information about all nutrients. The agency is concerned about space limitations on food labels and label clutter. The label format presented in this final rule contains considerably more information than is required by the existing label, and comparisons to the current practice of stating that U.S. RDA's have not been established for some nutrients may overlook the increased information required on the nutrition label. Given the fact that nutrition labeling has been extended to virtually all foods regulated by the agency and the concern that too much information on the nutrition label may overwhelm consumers, FDA finds no basis to conclude that statements that a reference value is not available for the particular component will add clarity to the label. Therefore, FDA is not providing for the use of statements regarding the lack of established reference values.

c. *Use of qualifying terms in presentation of calorie-specific recommended nutrient amounts.* The agency proposed (57 FR 32058 at 32070) to require the use of the qualifying terms "or less" and "or more" in conjunction with the proposed DRV list. Comments about qualifying terms are relevant to the presentation of calorie-specific daily values, as provided for by § 101.9(d)(8). While the agency did not specifically discuss the nutrients for which each of these qualifying terms were appropriate in the proposal, the examples presented in the appendices made it clear that the agency's intent was to use these terms in conjunction with those nutrients for which current dietary guidance specifies an "open-ended" decrease or increase in consumption. Therefore, because recommendations for total fat, saturated fat, cholesterol, and sodium intake are stated in specific amounts or less (Refs. 2, 3, and 4), the agency used the qualifying term "or less" with these nutrients. On the other hand, the recommendation for carbohydrate is stated as 55 percent or more (Ref. 3). Thus the agency used the qualifier "or more" with this nutrient. FDA included such qualifiers in its research.

142. A few comments opposed the use of the qualifying terms because of the interest in reducing label clutter or because their use conveys a message that a food should be avoided if it contains high amounts of a nutrient qualified by "or less." Several comments opposed the use of the qualifying terms if a range of values was used rather than a single value. One comment considered the qualifying terms unnecessary if FDA adopts a 2,000 calorie base.

The majority of comments supported the use of qualifying terms and suggested that such terms convey to consumers the notion of a variable target intake rather than a prescriptive intake.

Some comments supported "or less" and "or more." Others stated that "less than" was preferable to "or less," and one stated that "no more than" and "no less than" were preferable to "or less" and "or more." These comments argued that the recommendation for saturated fat intake was less than 10 percent of calories from saturated fat, and therefore the use of "less than" as a qualifier in general was more appropriate. No comment presented data concerning consumer use and interpretation of qualifier terms. A comment suggested dropping "or more" for carbohydrate, regardless of calorie base, as it is in conflict with the Dietary Guidelines for Americans (Ref. 4), which recommend the use of sugars only in moderation.

FDA agrees that the use of qualifying terms assists consumers in appropriate interpretation of the daily value information and may help to preclude too literal an interpretation of the values. Moreover, since no single caloric level can be specific for all individuals, the agency concludes that qualifying terms are appropriate regardless of the caloric level used. Furthermore, the agency is convinced that regardless of which term is selected, the qualifiers should be used consistently to avoid consumer confusion.

FDA acknowledges that, while Diet and Health (Ref. 3) recommends that 55 percent or more of calories be consumed as carbohydrate, the Dietary Guidelines (Ref. 4) recommend the use of sugars only in moderation. The label format will list sugars as a subset of carbohydrate. The agency is persuaded that the use of the qualifying term "or more" or "more than" with carbohydrate has the potential to be misleading to consumers given that carbohydrate includes sugars. The use of this term may be particularly confusing to consumers when the source of carbohydrate in a food is primarily sugars. Therefore, FDA will not provide for the use on the label of the qualifier "more than" or "or more" with carbohydrate.

FDA finds merit in the term "or less" because this term is presented after the quantitative value and thus does not interfere with the consumer's ability to locate the quantitative values (especially when the daily values are presented in a column). However, the agency believes that the term "less than" conveys a less specific target and thus meets the concerns of many comments that asserted that consumers need to be alerted to the fact that recommended amounts vary greatly from individual to individual. The agency also acknowledges that the qualifying term "less than" is more consistent with the recommendation for saturated fat.

Therefore, FDA is persuaded that qualifying terms should be included when daily values are presented, and that the qualifying term should be "less than." The agency has included this requirement in § 101.9(d)(9)(i). For consistency and to avoid consumer confusion, FDA will not provide for the use of the term "or less."

143. One comment stated that the agency should allow the use of the term "or more" with dietary fiber because such a qualifier is consistent with current dietary guidance.

FDA disagrees that it is appropriate to use the qualifying term "or more" with dietary fiber. While there is relatively little evidence that high fiber intake impedes mineral absorption and bioavailability (Ref. 3), concerns about excessive fiber consumption have led to specific recommended ranges for dietary fiber intake rather than open-ended recommendations. The report from the Life Sciences Research Organization (Ref. 103), which provides the basis for the DV for dietary fiber, specifically provides a range for recommended dietary fiber intake (10 to 13 g per 1,000 calories, or approximately 20 to 35 g per day) and is not stated as 25 g or more. Therefore, the use of "or more" with fiber is not consistent with dietary recommendations, and FDA will not provide for its use on the label to qualify dietary fiber.

d. *Clarifying footnote for daily value caloric intake level.* In the format proposal (57 FR 32058 at 32071), FDA asked for comment on the effectiveness of a footnote to convey to consumers the need to modify the DV amounts to meet their nutritional needs and for suggestions for alternative footnote statements. The proposal included the following explanatory footnote in the PERCENT DV with DRV graphic format: "For a 2,350 calorie diet. Your Daily Value may be higher or lower depending on your calorie intake."

Comment was requested on the following three alternative footnotes listed in the proposal (57 FR 32058 at 32071):

(1) Based on a 2,300 calorie diet. Fewer calories are recommended for women and young children.

(2) As part of a 2,400 calorie diet. Many young children and women over 50 need 2,000 calories or less. For a 2,000 calorie diet the Daily Value would be less than 65 g Fat, less than 20 g Saturated Fat, less than 275 g Carbohydrate, and 25 g Fiber (Sodium and Cholesterol do not change).

(3) A 2,000 calorie diet is for women over 50 and young children. Most teenagers, sedentary men, active and very active persons, and pregnant and breastfeeding women need more calories.

144. Comments were received from manufacturers, health promotion organizations, State governments, trade associations, universities, and consumer advocate organizations. The majority of comments supported the requirement of a footnote to clarify the calorie base for the daily value listing.

The explanatory footnote in the PERCENT DV with DRV graphic format was specifically supported by five of the comments. This footnote stated "For a 2,350 calorie diet. Your Daily Value may be higher or lower, depending on your calorie intake." However, one manufacturer objected to this footnote on the basis that it was ambiguous and ineffective and did not provide the necessary information.

Most comments stated that it is important for the consumer to understand that the DV may need to be adjusted because it is based on the number of calories consumed, and recommended calorie consumption depends on various factors, such as physical activity level, age, sex, weight, height, and metabolism. Two comments, although opposing inclusion of the DV, argued that an explanatory footnote should be included if the DV is included.

Two comments objected to all of the alternatives. One comment, from a consumer advocacy organization, asserted that the third alternative listed above would create more confusion by attempting to identify every segment of the population.

Two comments, one from a health professional organization and the other from a food manufacturer, stated a preference for using the footnote in the format shown in appendix F (57 FR 32058 at 32089) as the footnote clarifying the DV list. This footnote summarizes the Dietary Guidelines and includes statements such as "Eat a wide variety of foods." However, it does not include a reference to the DV's or the caloric level on which they are based because the format that the footnote appears on does not list DV's. (The format in appendix F of the format proposal is discussed in section V.G.11 of this document). One of the comments recommending this footnote stated that the footnote should be prefaced with a statement about DV's varying with calorie needs. The following was suggested: "Your calorie, fat, carbohydrate, fiber, and protein intake will vary based on age, height, weight, metabolism and activity level."

A trade association opposed the footnote included in appendix F of the format proposal as the clarifying footnote for the DV list, stating that it added to the clutter, and that it did not provide any relevant information to the consumer because too many calculations would be required to use the information in the footnote. Two comments suggested that the statement in the footnote of appendix F, "choose a diet low in fat (30% or less)," be clarified to reference the total caloric intake for the day. One comment requested that footnote information be consistent with dietary guidance and the nutrition label by changing "Use sugar * * * in moderation" to "Use sugars * * * in moderation."

Various other suggestions were made for the appropriate wording of a footnote. Some comments were concerned with brevity in the interest of space. Other comments emphasized clarity, offering longer footnotes. Several comments were concerned with conciseness. Some variations arose from the preference for a range rather than a single number for the DV.

The various footnotes offered in the comments stated that an individual's DV depends on calorie needs, listed individual characteristics that affect calorie needs, or simply provided the calorie base of the DV on the label.

Three comments from manufacturers suggested that footnotes should be optional. Another comment suggested a voluntary program of explanatory information provided in footnotes, with a stipulation that the footnote become mandatory if 70 percent of packages were not including it by 1996. Two comments objected to inclusion of a footnote on the basis that the label cannot be a source of dietary guidance. Others were concerned about the space used by the footnote.

Two comments addressed other possible footnotes to the nutrition information. Inclusion of dietary guidance for special dietary needs was suggested by a manufacturer. A consumer advocacy organization suggested the use of footnotes to explain the use of adjectives such as "high" on the basis that FDA is wrong in assuming that people will relate "high" to the idea of limiting consumption elsewhere. The following statement was suggested: "People eating this food may need to limit the fat (or other nutrient) that they consume from other foods."

The agency notes that the consumer research suggests that many consumers do not notice footnotes. One survey asked respondents how many calories the DRV's were based on, while the respondents viewed a label with a footnote providing the information. Over half of the respondents could not give the answer (Ref. 87). Another study provided subjects with a nutrition label that had a footnote stating the caloric level base (2,350 calories) of the DRV list. Over 70 percent of the subjects stated that the DRV's applied to them (Ref. 71), even though, according to this report, this caloric base should apply to only 10 percent of the population. However, in other surveys, when respondents were asked directly whether DRV's based on a specific calorie level applied to them, most recognized that adjustment would be needed and were able to give the correct direction of adjustment (Refs. 87 and 97). These results show that although most consumers do not notice footnotes, those who are given the information (and by inference, those who do read the footnote) are able to interpret it appropriately.

FDA, in section V.B. of this document, has addressed comments regarding whether the nutrition label is subject to a requirement to provide general dietary guidance to consumers. The agency concluded that the first consideration for the nutrition label must be to help consumers make informed food choices by enabling them to both comprehend the nutritional value of the food and to understand its relative significance in the context of the total daily diet. Thus, general dietary guidance is not to be provided as part of the nutrition label. If a particular label has space, however, general dietary guidance may be included outside of the nutrition label, as discussed further below.

The agency does not agree that a footnote should be placed on the label urging people, after eating the food, to limit nutrients in which the food is high. Such information depends on the use of adjectives with the PERCENT DV format, which the agency is not allowing, as discussed in section H.4. of this document.

FDA agrees with the majority of comments that a footnote is necessary to help consumers determine how their individual dietary needs compare with the reference DV's used on the label and to prevent the possible misunderstanding of the applicability of the reference DV's (see comment 132 of this document). At a minimum, an acceptable footnote must specify the calorie level used for the reference DV's so that consumers have some basis to evaluate possible differences between their dietary needs and the reference DV's used on the label. Also, a statement that an individual's daily values vary according to calorie needs is essential when calorie-specific daily values are presented. FDA has provided for a footnote that includes this information in § 101.9(d)(9)(i).

The agency believes that many other pieces of information mentioned in comments, such as the information presented in Appendices E and F ... the format proposal, may be appropriately included on the food label to give useful context to the nutrition information. However, this information may not be included within the nutrition label itself because such additional information would require significant additional space to present and therefore would detract from the readily identifiable image of the nutrition label. Specifically, it would be appropriate to list typical calorie intakes for men, women, and children and to summarize dietary guidance on the food label. Furthermore, if the manufacturer is willing to supply copies of the Dietary Guidelines for Americans upon request, a statement of the availability of such information would be appropriate. Examples include the following:

(1) Typical intakes for women are 1,600 to 2,200 calories, for men 2,000 to 3,000 calories, and for children (ages 4 to 14) 1,800 to 2,500 calories.

(2) Use this nutrition information to help you plan your total daily diet. The Dietary Guidelines recommend that Americans:

- Eat a wide variety of foods
- Choose a diet with plenty of vegetables, fruits, and grain products
- Choose a diet low in fat (30 percent of calories or less), saturated fat (less than 10 percent of calories), and cholesterol
- Use sugars, salt, and sodium in moderation

(3) For more complete information, a copy of the "Dietary Guidelines for Americans" may be obtained from (manufacturer's name and address).

e. *Footnote listing the caloric conversion factors.* 145. A number of comments addressed the inclusion of caloric conversion factors for fat, carbohydrate, and protein on the label to help consumers use the nutrition information to apply the recommended Dietary Guidelines for Americans. Several comments agreed that stating the caloric value per gram of fat, carbohydrate, and protein would help consumers better understand and use the nutrition information on the label. Many other comments objected to the inclusion of caloric conversion factors because of space considerations and because of reservations about how many people would be able and likely to use such information.

The agency is persuaded by comments from nutrition education experts that the public will benefit from having the caloric conversion factors on the label. FDA recognizes, as discussed above, that 9, 4, and 4 calories per gram for fat, carbohydrate, and protein, respectively, are general factors that may not apply to all foods. However, they are applicable to the majority of foods, and therefore, inclusion of these factors will be useful as a general guide. Moreover, FDA finds that any concerns about space are eliminated by its providing for intermediate size labels in § 101.9(j)(13). Accordingly, § 101.9(d)(9) requires that this information be included on the label.

4. CONTROL Format; Expression of Absolute Amounts in Grams/Milligrams

The majority of comments that opposed the PERCENT DV formats supported the CONTROL format. A few comments supported the current format, rejecting the revised list of nutrients, the new order in which nutrients are declared, and the PERCENT DV display. FDA has responded to the comments opposing the revision in the required list of nutrients and the order of nutrients earlier in this document (section III.A.2. of this document). A majority of the industry comments supported the CONTROL format without the DRV list. Some consumer groups and health organizations also supported the CONTROL format; however, they recommended that the DRV list be included.

146. Most comments in favor of the CONTROL format stated that research has not consistently shown that any other format has better performance characteristics on label use tasks than the CONTROL format.

The agency disagrees with this argument. Both FDA's and industry's research found that the simplest label formats with the smallest amount of information and the least number of columns had the best performance for label use tasks that require only simple comparisons or identifying differences between products. Because it has the least amount of information, the CONTROL format performs well on this kind of task. FDA's research suggests that with certain placement of the information, some other formats, including the percent formats, that provide more information can perform as well as the CONTROL format on these tasks. The industry study demonstrates that these other formats can also be designed in ways that lead to poorer performance on simple comparison tasks (e.g., by adding more columns to the display).

Both FDA's and industry's research also shows that for label use tasks that require consumers to make dietary judgments about the product, such as whether the food is high or low in certain nutrients or how the food fits into a daily diet, the best performing formats are those that include either the PERCENT DV declaration or adjectives. Other design elements such as listing reference DV's, grouping nutrients, or highlighting nutrients do not appear to improve performance on these types of dietary judgment tasks. The CONTROL format is among the poorest performers on tasks that require dietary judgment.

Being able to comprehend the nutrition information and to understand its relative significance in the context of a total daily diet means, at least in part, that consumers must be able to make accurate high/low judgments about the food. PERCENT DV and ADJECTIVE displays present high/low information directly. The g/mg formats (such as the CONTROL format) require that the consumer calculate percentages to get the information. The CONTROL format requires, in addition, that the consumer know the recommended amount for each nutrient. Research results show that consumers do not know the recommended amounts for nutrients, that many are not able to make such calculations, and that many are not willing to make the large number of calculations that would be required to include all of the listed nutrients in the judgment (see comments 105, 106, and 107 of this document).

147. Other comments supported the CONTROL format because it is uncluttered, because consumers are used to it, and because it is more consistent with dietary guidance, which is given in terms of g/mg amounts, than is the PERCENT DV format.

The agency agrees that simplicity and lack of clutter are important criteria in selecting a format. However, enough effective information must be presented to make the nutrition label useful. Therefore, the selection of a required nutrition label cannot be based simply on which one has the least amount of information.

Some of the arguments about consumer familiarity with a format were addressed in section V.G. 2 above. The agency noted that evidence from consumer research shows that consumers are not able to effectively use the current format for some important label uses. Therefore, consumers' greater familiarity with it does not have important benefits. In contrast, research shows that consumers are able to effectively use the PERCENT DV format, even though the format is new to them. The agency also noted above that g/mg amounts will continue to appear on the nutrition label for use by consumers who have come to rely on nutrition information presented this way

148. A large number of comments were opposed to the CONTROL format because it does not meet the criterion in the 1990 amendments of enabling consumers to understand the significance of the nutrition information in the context of a total daily diet. This argument was sometimes stated in conjunction with FDA's research finding that the CONTROL format had poor performance characteristics, particularly with regard to the dietary judgment tasks.

FDA agrees with this argument. A summary of research findings related to the CONTROL format appears in section V.D.2. of this document. For all the reasons discussed in this section, FDA concludes that the CONTROL format is not adequate to meet the criteria of the 1990 amendments.

5. HIGHLIGHTING Format

Highlighting was discussed in the format proposal both as a separate format and as a format enhancement. Most comments regarding the use of HIGHLIGHTING dealt with it as a format enhancement, and these comments are discussed in a later section.

149. The comments that discussed HIGHLIGHTING as a format were from industry health professional organizations, and consumer advocacy organizations. Most comments were opposed to the format. Many of these comments discussed the HIGHLIGHTING, ADJECTIVE, and GROUPING formats together. The comments argued that the HIGHLIGHTING format is inadequate and misleading because it gives undue emphasis to desirable components, thus tending to obscure the levels of undesirable components. In addition the comments stated that the HIGHLIGHTING, ADJECTIVE, and GROUPING formats have no satisfactory means of communicating the level of components that do not have a DV, such as complex carbohydrates and sugars. Some comments argued that a modified HIGHLIGHTING format that flagged both desirable and undesirable components of a product should not be selected because extensive consumer testing would have to be conducted to determine whether people are able to distinguish between the two types of flags. Other comments argued that the HIGHLIGHTING, ADJECTIVE, and GROUPING formats foster good-bad food messages.

Several comments from professional organizations argued that the HIGHLIGHTING format is redundant because nutrient content claims can be made on the front of the package. These comments stated that if anything is highlighted, it should be undesirable components to balance the front panel. Other comments argued that this format did not score well in consumer research and did not improve consumer comprehension of the label. One comment noted that international harmonization is problematic with HIGHLIGHTING, ADJECTIVE, and GROUPING formats because in Canada, such information is generally required to be grouped together and given equal prominence, whereas these formats include some form of emphasis in one or more parts of the nutrition label.

A supporting comment argued that the HIGHLIGHTING format is best because it is straightforward, easy to understand, and information can be quickly gleaned from it. The agency is persuaded by the comments and the research that the HIGHLIGHTING format should not be selected. FDA notes that this format has most of the disadvantages of the CONTROL/DV format (of which it is a variant), and it has several additional limitations. The format did not score well in consumer research on measures that involved putting the food into the context of a total daily diet. In addition, it emphasizes desirable features of products, which may already be emphasized by front panel statements and which may tend to obscure the levels of less desirable components. Therefore, FDA is not requiring the use of the HIGHLIGHTING format.

6. ADJECTIVE Format

Issues regarding the use of adjectives to describe nutrient levels arose in three contexts: support or opposition to the ADJECTIVE format itself; mandatory use of adjectives with another format, particularly the PERCENT DV with DRV format; and voluntary use of adjectives as a format enhancement. Adjectives as a format enhancement are discussed in section V.H.2. of this document.

150. Some comments argued that adjectives are inherently value-laden and would communicate a good-bad food perception.

The agency does not agree with this argument. As noted above in the discussion of this argument for the PERCENT DV format (section V.G.2. of this document), both FDA and industry research found that the ADJECTIVE and the PERCENT DV declarations tended to produce the most accurate judgments about whether products are high or low in various nutrients (Refs. 70 and 71). The g/mg formats were more likely than ADJECTIVE formats to lead to extreme and inappropriate dietary judgments, such as responses that a food was high in a nutrient in which it was actually low, or that a food should be avoided altogether because of a particular nutrient level. The agency is not requiring the ADJECTIVE format for other reasons.

151. Several comments argued that a complete scheme for assigning adjectives to all nutrients required to be listed on the label does not exist. They argued that because DRV's have not been established for all nutrients, including sugars and polyunsaturated fats, an acceptable scheme would be time consuming to develop.

The agency agrees that a complete scheme for assigning adjectives to all nutrients does not currently exist, and that the lack of DV's for some nutrients would complicate the development of such a scheme. However, as explained in Comment 134, all of the alternative formats except the CONTROL format share the limitation that DV's have not been set for some nutrients. Because the limitation is constant for almost all formats, it cannot be seen as a disadvantage unique to one format. The agency believes that providing DV information for the nutrients that have DV's is more beneficial than withholding it for all nutrients because it is unavailable for some. Nonetheless, the agency is not requiring the ADJECTIVE format for reasons stated in comment 152 of this document. Therefore, the issue raised by these comments need not be addressed further.

152. Several comments opposed the ADJECTIVE format because it would be confusing to consumers. One comment argued that the format provides information on whether a nutrient is high, medium, or low, but not whether it is a desirable or undesirable nutrient. Some comments argued that the format is too cluttered and directive. Some comments noted that the ADJECTIVE format showed a number of weaknesses in the consumer research, particularly a tendency for consumers to fail to differentiate between products when different nutrient levels were described by the same adjective. The comments noted that wide ranges, as proposed for the category "medium," would be misleading to consumers who did not attend to the nutrient values.

Several comments supported the ADJECTIVE format, arguing that the format is easy to read and does not require math calculations or working with numbers at all. One stated that it would be easier for the elderly and visually impaired to use. Other comments supported it because it was preferred by consumers in the research.
